With NTSC video, the video will appear on the iPod with black bars above and below the video. If the source was DV PAL, the video will appear with black bars on either side when viewed on the iPod display. Use the steps above for both PAL and NTSC to ensure correct display of DV video when the destination is a 4:3, square-pixel display, such as the iPod.

iDVD: More memory recommended for encoding HDV

This article has been archived and is no longer updated by Apple.

HDV is a new video format that allows you to record high-definition video onto standard DV media (such as mini-DV tape) using a supported camcorder. You can edit and export HDV video in its native format using Final Cut Pro 5. You can then import the native HDV QuickTime video files into an iDVD project for inclusion on a standard definition DVD.

You can choose between best performance and best quality when you set up the encoding of the video in your DVD project. If you choose best performance, you have the additional option of enabling background encoding, which allows you to continue working on your project while the video is encoded in the background. If you do not have background encoding enabled, the video will be processed when you burn a DVD or save as disc image.

Encoding the video in your iDVD project can take significantly longer with HDV source video. Adding additional memory to your computer will improve performance. The speed of your processor(s) will also impact the performance.

Native HDV editing is a feature of Final Cut Pro 5. While you can also capture and edit HDV in iMovie HD and Final Cut Express HD, these applications transcode the HDV source video to the Apple Intermediate Codec. The Apple Intermediate Codec is a high-quality video codec that Apple developed for use as an alternative to native MPEG-2 HDV editing in an HDV workflow. Transcoding to the Apple Intermediate Codec is also an option in Final Cut Pro.For more information click here.

Mac OS X Server 10.4: Group members can‘t save to a CIFS share

This article has been archived and is no longer updated by Apple.

When using certain applications, group members cannot save to a CIFS share; they get a permissions error.

This happens on volumes that don't have ACLs enabled. The solution is to either enable ACLs or to disable the ACLs in /etc/smb.conf. Follow the steps below to disable the ACL support for the shares in question.

1. Open /etc/smb.conf in a text editor. The file is owned by root so you need to either use sudo or log in as root.
2. Find the section for the relevant share. For example, if the share is named "Share", there will be a section named "[Share]" in the file.
3. Look for the line in the share section containing "vfs objects = darwin_acls".
4. Remove "darwin_acls" from the line so it looks like this:

   ```
   vfs objects =
   ```

5. Save the file.
6. Stop and Start the CIFS server.

Mac OS X Server 10.4: Installing on a computer that won‘t start up from the Installation disc

This article has been archived and is no longer updated by Apple.

Some computers that are compatible with Mac OS X Server 10.4 can't start up (boot) from the Server Installation CD or DVD. When you try it, the computer may display a blank, gray screen or kernel panic. For this reason, Apple allows you to use a metapackage (.mpkg) file from the Installation disc to install Mac OS X Server over a running Mac OS X 10.4 (client) installation.

Note: If you are running Mac OS X 10.4.10 you cannot use the metapackage file from the Installation disc. Instead, follow the instructions in article 305537.

Note: You must not use this capability to install software that is older than what shipped with your computer (learn more). This document is only intended for Mac OS X Server 10.4 or later on PowerPC-based computers (more).

To install Mac OS X Server 10.4 from the .mpkg file, follow these steps:

1. Be sure that all software on the target computer is up to date.
   Note: If you decide to start with a fresh system by doing an erase install (this is not required), be sure to complete the Mac OS X Setup Assistant while the computer is connected to your network.
2. Be sure that your computer is connected to your network.
3. Make sure Windows Sharing is disabled in Sharing preferences.
4. Restart the computer.
5. Insert the DVD or the Disc 2 CD from the retail version of Mac OS X Server 10.4.
6. Open the MacOSXServerInstall.mpkg Installer, which is located in the "Other Installers" folder on the DVD and at the root level of the Disc 2 CD.
7. Follow the onscreen steps.
8. When finished, restart the computer.
9. The Server Assistant appears. Use it to complete the setup, making sure that you configure the computer as a standalone server.
10. Use Software Update to install all available updates.
11. Restart the computer.
12. Go back to Software Update and install all the remaining updates, restarting your computer as necessary.
13. If desired, you can now use Server Admin to set up the server as an Open Directory Master.

Note: This procedure also appears on page 106 of the Getting Started manual, available here.

iDVD ‘08: After 99 images in a slideshow, set-top DVD player will reset to chapter 1

This article has been archived and is no longer updated by Apple.

In iDVD '08, your slideshows are no longer limited to 99 images. You can now have up to 9,801 images in a slideshow. When you are playing a slideshow on your DVD player, it will number the slides (which are chapters) from 1 to 99 and then start numbering over again at number 1 (on the one-hundredth slide). This is normal and not something you can control when you author your DVD. It is a specification that applies to all DVD players.

iDVD ‘08: Slideshow audio playback briefly drops out after 99 images

This article has been archived and is no longer updated by Apple.

In iDVD '08, your slideshows are no longer limited to 99 images. You can now have up to 9,801 images in a slideshow. If you add a slideshow to your iDVD project with more than 99 images and an audio track, you may notice that the audio drops out very briefly after the 99th slide on your burned DVD.

You won't notice this if:

- You have 99 or fewer slides in a slide show.
- You preview a slide show with more than 99 images in iDVD (it only occurs on a burned DVD or disc image).

Final Cut Pro 5: About capturing down-converted DV from HDV source

This article has been archived and is no longer updated by Apple.

Final Cut Pro 5 supports capturing a number of different media types using FireWire device control. Because of differences in the data-structures of DV and HDV, there are some important points to keep in mind if you plan to capture DV video that is being down-converted on-the-fly from an HDV tape source.

Some HDV decks and camcorders are capable of playing an HDV tape and performing a down-convert of that signal, sending a DV signal out via FireWire. Final Cut Pro can capture this DV signal, but regular DV device control may not be appropriate in this capture scenario, because the tape transport mechanism is not really handling DV-formatted video on tape.

DV-formatted video features intra-frame compression; that is, each frame contains all the data needed to represent that frame. HDV uses more complex compression methods, and it's necessary for several frames of HDV to be read into memory before they can be displayed or captured. A single frame of HDV video may contain information about the picture content of neighboring frames, while not containing an entire "picture" of data itself. (HDV features an MPEG-2, Long-GOP architecture.)

Because of these differences, HDV and DV use different device control methods for communicating with the deck or camera during capture. If there are timecode breaks on the tape and Final Cut Pro's preferences are set to "Make New Clip" on timecode breaks, unexpected results may occur.

To experiment with capturing DV from an HDV source that is being down-converted on-the-fly, it's a good idea to change the setting in User Preferences for "On Timecode Break" to "Abort Capture" or "Warn After Capture", as opposed to the default, "Make New Clip".

If you use Capture Now and the preference is set to "Abort Capture" on timecode breaks, you'll have to attend to the process since the capture will stop after each timecode break. The upside of this method is that you will maintain original timecode, allowing you to re-capture later if desired.

If you use Capture Now and the preference is set to "Warn After Capture" on timecode breaks, you can capture the entire tape at once, but the timecode of the captured result may not match what is on tape. This will preclude the possibility of subsequent recapturing based on timecode.

Another method would be to capture the source as HDV, and then use Compressor to perform the down-conversion to DV.

iDVD: Make sure you have enough drive space for OneStep DVD

This article has been archived and is no longer updated by Apple.

The OneStep DVD feature in iDVD 5 enables you to quickly transfer your video onto a DVD. However, the video capture process will stop if you don't have enough drive space and you will get the following alert:

> Video Capturing Aborted

If you haven't updated to iDVD 5.0.1 or later, you may not see this message.

Free up additional drive space before trying the OneStep DVD again.

Logic Pro 7.2 not compatible with ProTools 6

This article has been archived and is no longer updated by Apple.

Logic Pro 7.2 does not work under DAE/TDM with ProTools 6; DAE/TDM stops working after upgrading to Logic Pro 7.2.

For technical reasons, you can't run DAE/TDM with Logic Pro 7.2 and ProTools 6. If you are running a ProTools HD or HD Accel system, upgrading to ProTools HD 7 will resolve the issue. If you have earlier ProTools hardware that does not work with ProTools HD 7, then you will need to reinstall Logic Pro 7.1 from the original disc and use that version with DAE/TDM.

Before reinstalling, you need to delete the file `/Library/Receipts/Logic Pro.pkg`. You might also want to rename the Logic Pro 7.2 application to prevent it from being overwritten when you reinstall Logic Pro 7.1.

For more information on ProTools hardware compatibility, see the Digidesign website.

iDVD can only run after DVD region code has been set

This article has been archived and is no longer updated by Apple.

You can only create or open a project in iDVD if the region code has been set on your computer.

The first time you play a DVD on your computer, your optical drive is set to the region code of the disc. The drive's region code restricts DVD Player to playing discs with the same region code or with no region code.

If you are unable to create a new iDVD project or open an existing project you must set the region code for your optical drive.

Note: You must have a display connected to your computer. If you plan to run the computer without a display attached ("headless"), you will need to connect a display in order to initially set the region code.

PowerBook G4 (Double-Layer SD) audio stutters or skips

This article has been archived and is no longer updated by Apple.

When you are running two or more audio applications on your PowerBook G4 (15-inch Double-Layer SD) or PowerBook G4 (17-inch Double-Layer SD), the audio may intermittently stutter, echo, or skip backwards. This can happen even if one audio application isn't playing or you have the sound muted in the application (such as when playing a game).

This can involve any application that uses audio, such as QuickTime, iTunes, iDVD, and many third-party applications like games and audio applications.

To avoid this, update your computer to Mac OS X 10.4.5.

Microsoft Office applications fail to save to a server volume

This article has been archived and is no longer updated by Apple.

If more than one user logs in to a Mac OS X Server from different client computers and with the same UID, they will be unable to save server-stored files using a Microsoft Office application after any of the users logs out. When a save is attempted, this alert will appear:

> "There has been a network or file permission error. The network connection may be lost."

Workarounds

You can use one of these workarounds:

- Use a shared directory service instead so that every user logs in with their own unique ID.
- Don't share a server user—each client user should have a unique ID.
- Unmount the server volume before logging out of Mac OS X on the client computer.

Why does this occur?

Microsoft Office applications use a "safe save" that stores files in the TemporaryItems folder that's on the same volume as the file. With a shared file system, the path is:

/.TemporaryItems/folders. *(local UID)* /TemporaryItems.

However, when one of the users logs out of the local client, the "/.TemporaryItems/folders. *(local UID)* /TemporaryItems." directory is deleted, preventing any other currently-logged in users that are using the same UID from saving from Microsoft Office applications.

GarageBand: Possible duplication of loops after updating to v3.0

This article has been archived and is no longer updated by Apple.

Duplicate Loops

The Installer for GarageBand 3 can optionally install the Apple Loops for GarageBand to any available volume or location on your system. If you upgrade from a previous version of GarageBand and elect to do this, your previously installed Apple Loops will not be moved or deleted, leading to possible duplication of some or all of the loops.

If this happens, you may delete the old copies of the loops after installing GarageBand 3. For an overview of the default locations for GarageBand loops, look here.

If you use any other applications that use Apple Loops, such as Logic Pro, Logic Express, Soundtrack Pro, or Soundtrack, you may wish to index the newly installed loops from GarageBand 3.

DVD Studio Pro 3: Not compatible with Power Mac G5 (Late 2005) or iMac G5 (iSight)

This article has been archived and is no longer updated by Apple.

DVD Studio Pro 3.x requires a computer with an AGP video card. PowerMac G5 (Late 2005) models (released October 19, 2005) and iMac G5 (iSight) models feature newer PCI Express video cards. Because of this, DVD Studio Pro 3.x is not supported on these computers and if you install it you may encounter unexpected behavior.

For instance, on Quad processor models, if you try to import MPEG-2 assets DVD Studio Pro will unexpectedly quit. This does not occur with DVD Studio Pro 4.x.

If you need to use DVD Studio Pro on Power Mac G5 (Late 2005) or iMac G5 (iSight) computers you'll need to purchase Final Cut Studio.

For More information on Final Cut Studio click here.

GarageBand 3: Media browser uses different audio interface than GarageBand

This article has been archived and is no longer updated by Apple.

The Media Browser does not follow the GarageBand audio settings. Instead, it uses the default audio device setting from Audio MIDI Setup.

If GarageBand is set to use a different interface, then they will not match. To resolve the difference, set Audio MIDI Setup to use the same audio interface as GarageBand.

Published Date: Oct 11, 2016

GarageBand 3: Long Apple Lossless files stop playing before the end of the file

This article has been archived and is no longer updated by Apple.

Long Apple Lossless files sometimes stop playing before the end of the file.

This occurs if the Apple Lossless file is longer than the maximum GarageBand song length of 1999 measures. When an Apple Lossless file is added to a song, the marker does not automatically move past the maximum possible song length to accommodate files that exceed this length.

To resolve this issue, reduce the tempo of the song. Cutting the tempo in half may be a good starting point, depending on the length of the Apple Lossless file.

This document will be updated as more information becomes available.

Xsan: Configuring Emulex switches in a Cascade topology

This article has been archived and is no longer updated by Apple.

When you configure Emulex switches for a topology that involves cascading (also known as trunking and inter-switch linking), it is important to configure the switches in a "star" topology with a single "root" switch at the center with "edge" switches connected to the root switch with two fibre channel connections.

Note: For simpler non-cascading configurations, see this article instead.

The steps below refer to Smart Settings. The Smart Settings for each port on Emulex 355 and 375 fiber switches reflect the role that the particular device attached to that port will provide in the fabric topology. The Smart Setting varies according to whether the port will connect to a host (initiator), a storage device (target), or another switch (tree cascade).

The following steps are to be performed in the Emulex Web Manager. To learn more about Web Manager, see the User Guide which is specific to your model Emulex switch. You can download Emulex switch manuals here.

Root Switch Setup

1. Set up Zoning:
    a. Choose **Advanced Functions > One step zoning >**.
    b. Select the checkbox for Zoning Active.
    c. Click Submit.

2. Set up Smart Settings:
    a. Choose **Port > Smart Settings**.
    b. Be sure that each of the two ports for every edge switch that you have is set to "tree cascade."
    c. All other ports should be set to target or initiator.
    d. Click Submit.

3. Configure Auto trunking config:
    a. Choose **Advanced Functions > Automatic Trunking**. You will see each of the Tree Cascade ports listed to the left. Across the top you will see Trunk Groups.
    b. Configure the two ports that are connected to the first edge switch to belong to Trunk Group A.
    c. Set the two ports that are connected to the second edge switch to belong to Trunk Group B, and so forth.
    d. Click Submit.

Edge Switch Setup

Follow the steps below for each edge switch.

1. Set up Zoning:
    a. Choose **Advanced Functions > One Step Zoning >**.
    b. Select the checkbox for Zoning Active.
    c. Click Submit.

2. Set up Smart settings:
    a. Choose **Port > Smart Settings**.
    b. Set the ports which are connected to the root switch to "tree cascade." These ports will be connected to two of the ports set to tree cascade on the root switch.
    c. All other ports should be set to target or initiator.
    d. Click Submit.

3. Configure Auto trunking config:
    a. Choose **Advanced Functions > Automatic Trunking**. You will see each of the two Tree Cascade ports listed to the left. Across the top you will see Trunk Group A.
    b. Configure the ports that are connected to the root switch to belong to Trunk Group A.
    c. Click Submit.

4. Set up Load Balancing:

a. Choose **Advanced Functions > Load Balancing**.
b. For each port that is set to initiator, alternate between Trunk Group A Port `a` and Trunk Group A Port `b`. (where `a` and `b` are the port numbers that correspond to those which are connected to the root switch)
c. Click "Submit."

Aperture: Images seem to be missing from Filter HUD searches or Smart Albums

This article has been archived and is no longer updated by Apple.

Sometimes images that you expect to find don't appear in the results of a Filter HUD search or Smart Album. This usually happens because the missing images have a Rejected (x) rating.

Any time you open the Filter HUD, whether in a Project or Smart Album, the rating will default to Unrated or Better until you change it. A reject ranks lower than unrated, so your search results will react accordingly.

If you want all images to be eligible for search results, remember to pay attention to the Rating that you are specifying. Move the Rating slider to the left so that you have "Rating: is greater than or equal to x."

I don‘t have a DVD drive to install iLife ‘06 or my computer doesn‘t recognize the iLife ‘06 Install Disc

This article has been archived and is no longer updated by Apple.

If you have a Mac with a G4 processor that has a CD drive and no DVD drive, you won't be able to install iLife '06 because the computer won't recognize the iLife '06 Install DVD disc. This can include certain model eMac computers and early model PowerBook G4 computers.

Unlike previous versions of iLife, there is no iLife '06 Install CD. There is only an iLife '06 Install DVD. Make sure that your computer meets the minimum requirements for installing iLife '06. If you have another computer with a DVD drive and if all requirements are met except the DVD drive, you can do one of the following:

Option 1

Use target disk mode for the install.

1. Insert the iLife '06 Install DVD into the computer with the DVD drive.
2. Shut down both computers.
3. Restart the computer with a DVD drive in target disk mode.
4. Connect the computer with the DVD drive to the computer with the CD drive using a FireWire cable.
5. Turn on the computer with the CD drive.
6. When that computer starts up, the second computer's hard drive will appear on the first computer's desktop and the iLife '06 Install DVD will also show up on the desktop. Now you can install iLife '06 on the computer with the CD drive.

Option 2

Copy to a network or external drive to install.

Use another computer with a DVD drive, and drag iLife '06 Install DVD to any of the following with at least 10 GB of free disk space:

- A network file server
- An external hard drive
- An iPod in Macintosh format

When the copy is complete, you can install iLife '06 from the volume above on the computer without a DVD drive.

Option 3

Connect and install using file sharing.

1. Insert the disc on another computer on your network and turn on file sharing.
2. From the computer with the CD drive, connect over the network to the computer with the DVD drive select the iLife '06 Install Disc as the volume to mount.
3. Install iLife '06 from the server volume.

If your computers aren't already connected to a network, see this document for information on creating a small network.

iMovie: Exporting to "Full Quality" may not include URLs, Chapter Markers

This article has been archived and is no longer updated by Apple.

When you export to QuickTime using the "Full Quality" preset, iMovie creates a file based on the native format of the current project. This format is selected when you first create the project based either on the option you choose, or the first footage you import into the project.

Here is a list of the options you can choose when creating a project, and the resulting file format that would be exported when selecting "Full Quality".

Project format	Full Quality export format
DV or DV Widescreen	.dv file, DV Stream format
HDV	.mov file, Apple Intermediate Codec
MPEG 4	.mp4 file, MPEG-4 video, AAC audio
iSight	.mov file, Photo-JPEG, 16-bit audio

Some of these file formats do not contain chapter markers, URLs, aspect ratio flags, playback quality flags, or other metadata. As a result, when viewing or importing these files into other applications, these items will not be retained or read; because they are not a part of the file you are trying to import.

Also, DV and HDV files usually have rectangular pixels. As a result, the image may appear stretched when viewed in another application, such as QuickTime Player. This is normal for this format. The iMovie preview window compensates for the pixel shape depending on the monitor you use to view the project.

Note: When viewing a .dv file in QuickTime Player or other applications, note that it may also appear somewhat pixelated.

iWeb: Resizing a playlist horizontally can lead to erroneous song selection

This article has been archived and is no longer updated by Apple.

In iWeb, you can drag a playlist of songs from the Media browser to the iWeb canvas. This lets other easily find the songs on the iTunes Store. If you shrink a playlist horizontally by dragging its selection handles to the left or right, users may not get the right song in the iTunes Store.

Each song in the playlist has an associated icon (a small gray circle with a white arrow) that "links" to a search for that song in the iTunes Store. If you shrink the playlist too far, some songs may line up incorrectly with their respective icons. When the site is published and a song is selected, it may link to the wrong song in the iTunes Store.

To avoid this issue, try not to resize your playlist horizontally to the extent that a song title is not lined up with its icon:

Here's the correct way to include a playlist:

Here's the same playlist that has been collapsed too much and will cause problems when users select a song from your published website:

Note: Published playlists can be used to share your favorite playlists with others so they can find the songs in the iTunes Store. You cannot play a song from a published playlist by clicking its link.

iWeb: Drag photo albums one at a time

This article has been archived and is no longer updated by Apple.

You can use the Media browser in iWeb to drag an iPhoto album to your Photos page. However, you cannot select and drag multiple albums (using Shift-click or Command-click). If you want to add several iPhoto albums, you must add them one at a time. Each Photos page can hold up to 99 photos.

Note: You can add photo albums to iWeb pages other than the Photos page, but pictures are easier to organize if you use the photo grid on the Photos page.

Published Date: Oct 11, 2016

iWeb: Do not use similar names for your sites

This article has been archived and is no longer updated by Apple.

If you have two sites in iWeb with the same name but different capitalization (for example: "site" and "SITE"), after publishing, only one site will appear online.

To prevent this, do not give your sites names that are the same except for capitalization. Use numbers (Site1, Site2) or different names (Work, Home) to name your different sites in iWeb.

Published Date: Oct 11, 2016

iWeb: Original sites are overwritten when publishing to the same folder

This article has been archived and is no longer updated by Apple.

In iWeb, when you choose the "Publish to a Folder" option from the File menu, the sites in the Site Organizer are published to the local folder of your choice. If you make changes and publish again to the same folder, the folder's previous sites will be overwritten — you will not receive a warning.

Published Date: Oct 11, 2016

iWeb: About using identical page names on multiple sites

This article has been archived and is no longer updated by Apple.

iWeb allows you to build more than one website. For instance, you may decide to create a personal site and a business site. With iWeb 1.0, you cannot use the same name for two pages, even if they are on different sites. For example, if you have a page called "Welcome" on Site 1, you cannot have a page called "Welcome" on Site 2. iWeb will warn you if you try to rename a page using a duplicate name with this alert:

> Invalid Name
> The name "Welcome" is already in use and cannot be used. Please choose a different name.

iWeb automatically renames multiple template pages (like Welcome or Photos) by adding a number at the end of the page name.

Updating to iWeb 1.0.1 will allow you to use the same name for different sites. However, you can’t use the same name for different pages on one site. If you try, iWeb will add a number to the name.

iWeb: Photo captions with large font sizes may not display

This article has been archived and is no longer updated by Apple.

The photo templates in iWeb allow you to easily arrange and display photos with captions on your website. If you set a very large font size or have several lines for your photo captions, the text may get cut off by the border area around the photo.

You can adjust the font size of text by choosing Font from the Format menu, and then choosing Show Fonts. You can change the number of columns and the height of captions using the Graphic Inspector.

For more information on adding photos and captions see "Adding photos and captions" in iWeb Help.

Published Date: Oct 11, 2016

iWeb: Long page names may not display properly in the navigation menu

This article has been archived and is no longer updated by Apple.

iWeb automatically creates a navigation menu — a table of contents — on each page in your website which lists each page in your site as a link. Very long page names may not display correctly in certain themes. If you are using long page names, check the navigation menu of each page in your site to make sure that the links are displayed correctly. To see how the navigation menu appears in a web browser, publish your site to a folder and visit the site.

Tip: If you don't wish to see a page's name in the navigation menu, simply select the page in the Site Organizer and in the Page Inspector deselect the "Include page in navigation menu" checkbox.

iWeb: How much disk space will my site use?

This article has been archived and is no longer updated by Apple.

If you need to determine how much disk space your website will take up on your iDisk before you publish your site, try the following steps:

1. From the **File** menu, choose **Publish to a Folder** (File > Publish to a Folder).
2. In the sheet that opens, navigate to a location on your hard drive that you can find easily (for instance, the Documents folder).
3. Click New Folder and pick a name for your folder (this is where all of the elements for your website will be saved).
4. Click Choose.
5. After the site has been published, iWeb will give you a choice to Visit Site Now (which will open the site in your default web browser) or return to iWeb (OK button). You can select either choice.
6. In the Finder navigate to the folder you created in step 3 and click once to select the folder.
7. From the **File** menu, choose **Get Info** (Command-I).

In the General section of the Info window the size of your site will be listed (if you have Mac OS X 10.4 Tiger, the size will also appear in the top right corner of the Info window).

Published Date: Oct 11, 2016

iWeb: Spaces in page names are replaced by %20 in website URL

This article has been archived and is no longer updated by Apple.

If you use spaces in site names or page names, the spaces will be replaced with "%20" in the URL of each page. For instance, if you have a site named "My Site" that contains a page named "My Page," the URL will be formatted http://web.mac.com/YourMemberName/iWeb/My%20Site/My%20Page.

This happens because some special characters (like a space) are encoded according to the the standard Uniform Resource Locator (URL) specification.

Mac OS X discs for PowerPC-based Macs don‘t work with Intel-based Macs

This article has been archived and is no longer updated by Apple.

Mac OS X installation discs that came with a PowerPC processor-based Mac won't work with an Intel processor-based Mac, and vice-versa, even if both Macs came with the same version of Mac OS X. You can't start up an Intel-based Mac from a CD or DVD that came with a PowerPC-based Mac, nor a PowerPC-based Mac from an Intel-based Mac's discs, either by holding the C key at startup or by using Startup Disk preferences.

To start your computer from a disc, use the disc that came with the computer.

Power Macintosh G3: PC Compatibility Card ODI Driver Issue

With a PC Compatibility Card in a Power Macintosh G3, I'm not able to get networking functioning on the PC side with the ODI driver (MACODI.COM).
This article has been archived and is no longer updated by Apple.
On a Power Macintosh G3, use the NDIS driver (MACNDIS.DOS) for networking. Consult your PC Compatibility Card User's Manual on how to install networking using the NDIS driver instead of the ODI driver.

Also, make sure you are running PC Setup 1.6.4 if you are using the PC Compatibility Card on a Power Macintosh G3.

How to show or hide the MiniStore in iTunes

This article has been archived and is no longer updated by Apple.

iTunes 7 and later contain an option called MiniStore. This MiniStore provides you with similar music or video choices based on the items currently selected in your library.

The first time you launch iTunes 7 the MiniStore displays a message that explains the MiniStore and asks you if you would like to turn it on. The MiniStore is not enabled until you click on Turn On MiniStore

Once enabled, you can show or hide the MiniStore by choosing **Show MiniStore** or **Hide MiniStore** from the **View** menu.

The MiniStore works like this, iTunes sends data about the item selected in your library to the iTunes Store to provide relevant recommendations. When the MiniStore is hidden, this data is not sent to the iTunes Store.

If you have an audiobook or TV show selected in iTunes, you'll see the top audiobooks or TV shows in the MiniStore. If there's not an iTunes Store available for your country, then you will see content for the USA.

You can disable the ability to show the MiniStore by disabling the iTunes Store in Parental Controls. Click here for steps to do that.

Power Macintosh G3: Using PlainTalk Speech Recognition v1.5

This article discusses PlainTalk Speech Recognition 1.5 compatibility with Power Macintosh G3 computers, as well as solutions to known issues. This article has been archived and is no longer updated by Apple.
PlainTalk Speech Recognition 1.5 can be used with platinum colored Power Macintosh G3 computers. It cannot be used with Power Macintosh G3 (Blue and White) computers. PlainTalk 1.5.4 is compatible with the Power Macintosh G3 (Blue and White), iMac, and the Power Macintosh G3 with the DVD drive.

Refer to article 60339: "**PlainTalk: Using Speech Recognition 1.5.4**" for additional information.

There are some issues you should be aware of before installing the Speech Recognition component of PlainTalk 1.5 on a Power Macintosh G3 desktop or minitower computer.

Note: These issues do not apply to the PowerBook G3 or PowerBook G3 Series computers.

PlainTalk 1.5 includes the following components:

- English Speech Recognition
- English Text-to-Speech
- Mexican Spanish Text-to-Speech

The English and Mexican Spanish Text-To-Speech software came with the Power Macintosh G3 (beige) minitower and desktop computers. Both installers can be found on the Apple Macintosh CD, which allows you to reinstall your computer's system software. These components have been tested, and are supported on Power Macintosh G3 computers. Please read the "Using English Text-to-Speech" and "Using Mexican Spanish TTS" documents included with these installers for detailed information on how to use this software.

English Speech Recognition 1.5 does not come with the Power Macintosh G3 desktop or minitower computers. It has not been tested and is not supported on these computers. PlainTalk version 1.5.4, combined with Mac OS 8.6, are compatible with the Power Macintosh G3 (Blue and White), iMac, and Power Macintosh G3 computers with DVD drive. Refer to the following Knowledge Base article for additional information:

Article 60339: "**PlainTalk: Using Speech Recognition 1.5.4**"

Here are solutions to known issues.

Issue: MacinTalk 3 Voices Break Up With Virtual Memory On

Description
When Virtual Memory is turned on, you may hear stuttering or broken speech when using MacinTalk 3 voices.

Workaround
Turn off Virtual Memory in the Memory control panel and restart your computer. You can also prevent this issue by using a MacinTalk Pro voice (Victoria, Bruce or Agnes) from the Speech control panel. You can install the MacinTalk Pro voices using the English Text-to-Speech installer on the Power Macintosh G3 CD. MacinTalk 3 voices and MacinTalk Pro voice have different icons. The Voices folder in the Extensions folder contains all the voices used by Text-to-Speech and Speech Recognition. MacinTalk 3 voices have a "3" in their icon. MacinTalk Pro voices have a "P" in their icon.

Issue: Audio Feedback From Built-in Monitor or External Speakers

Description
On both desktop and minitower Power Macintosh G3 computers, you may hear feedback if the monitor's built-in speakers or external speakers are too close to the PlainTalk microphone.

Workaround
Increase the distance between the PlainTalk Microphone and any external speakers. If you have a monitor with built-in speakers, turn the speaker volume down, or use headphones.

Issue: Microphone Disconnected Error When Speakable Items is Starting Up

Description
On desktop Power Macintosh G3 computers with the audio card option, you may see an error message that says: "Speakable items could not run because the microphone is disconnected" while Speakable items is starting up.

Workaround
Select any sound input option other than the mic (like the CD-ROM) before turning Speakable Items on. Reselect the mic after Speakable Items has started up to use Speech Recognition.

Power Macintosh G3 Computers With DVD Drive Are Incompatible With Speech Recognition

Description
Power Macintosh G3 computers (both the original beige and Blue and White models) that have a DVD drive are incompatible with Speech Recognition 1.5. These computers only record sound at 44.1 KHz. Speech Recognition 1.5 is incompatible with the 44.1 KHz setting.

Workaround
PlainTalk version 1.5.4, combined with Mac OS 8.6, are compatible with the Power Macintosh G3 (Blue and White), iMac, and Power Macintosh G3 computers with DVD drive. Refer to the following Knowledge Base article for additional information:

Article 60339: "**PlainTalk: Using Speech Recognition 1.5.4**"

Mac OS X 10.4: Computer speaks unexpectedly, or a black box unexpectedly appears around a file, folder, or other item

This article has been archived and is no longer updated by Apple.

If a black outline (or box) unexpectedly appears around a file, folder, icon, button, or other item when you click it, VoiceOver is probably enabled. Your computer might also be unexpectedly speaking items that you click on.

If you don't want VoiceOver on, turn it off in the Universal Access preference pane, or by pressing Command-F5 (or Fn-Command-F5 if you have an iBook or PowerBook).

Tip: If you want to prevent the Command-F5 key combination from turning VoiceOver on or off, go to Keyboard & Mouse preferences, click the Keyboard Shortcuts tab, then deselect the "Turn VoiceOver on or off" shortcut.

About the security content of AirPort Firmware Updates 5.7 and 6.3

This article has been archived and is no longer updated by Apple.

This document describes the security content of AirPort Firmware Updates 5.7 and 6.3, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

AirPort Firmware Update 5.7
AirPort Firmware Update 6.3

- CVE-ID: CVE-2005-3714

  Impact: AirPort network interface becomes unresponsive

  Description: A malicious network attacker that can generate specially crafted packets may be able to cause an AirPort base station's network interface to stop responding normally, resulting in a denial-of-service. This update addresses the issue by discarding the malformed packets. Credit to Michael Zanetta of NETwork Security Consortium for reporting this issue.

iPhoto 6: Inserting photos on calendar dates

This article has been archived and is no longer updated by Apple.

If you want to place a photo on a date in an iPhoto calendar, simply drag the photo to the day where you want the photo to appear, and that photo will fill that day's square.

You can drag the photo to another day or remove it from the calendar by dragging it back to the photos list.

If a grey square remains after removing a photo, don't worry, it's just the placeholder where you previously had inserted a photo. To remove the placeholder, select it, and press the delete key on your keyboard.

Published Date: Oct 11, 2016

iPhoto 6: Beware of special characters in Photocast album names

This article has been archived and is no longer updated by Apple.

When publishing a photocast, note that album names will be converted to simple text without accent marks, spaces, or other special characters. As a result, publishing similar names may result in one photocast overwriting another. For example, all three of these entries would be treated as the same name:

- tést-a
- test a
- tèst a

To avoid this, give each album that you publish a name that is unique without regard to marks such as accents.

If you inadvertently overwrite a photocast, rename the album in the iPhoto source list using a unique name, and then publish the photocast.

Mac OS X 10.4.3 or later: iMac G5 fans run at full speed after using single-user mode

This article has been archived and is no longer updated by Apple.

If you start your first generation iMac G5 computer in single-user mode, the computer fans will run at full speed for as long as you are in single-user mode. This is normal. However, on a first generation iMac G5 with Mac OS X 10.4.3 or later, the fans may continue to run at full speed even after you restart the computer normally.

Solution

If your iMac gets into into a state where the fans have remained at full speed after using single-user mode, follow these steps:

1. Type "exit" at the single-user mode command line prompt.
2. Press Return.

The fans should behave as expected after Mac OS X starts up.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

iMac (Early 2006), iMac (Mid 2006), iMac (17-inch Late 2006 CD): Memory Specifications

This article has been archived and is no longer updated by Apple.

The iMac (Early 2006) computer has two SDRAM slots in the bottom of the computer. The iMac ships from the factory with at least 512 MB of DDR2 SDRAM installed into the top slot. (The computer may come with more RAM in the top slot or RAM in the bottom slot, depending on how you ordered the computer from Apple.)

The iMac (Mid 2006) ships from the factory with at least 512 MB of DDR2 SDRAM, in two 256 MB DIMMs; one in each of the memory slots. **Note**: If you upgrade the memory in your iMac (Mid 2006), make sure you have matching size SO-DIMMs in each slot for best graphics performance.

The iMac (17-inch Late 2006 CD) ships from the factory with at least 512 MB of DDR2 SDRAM, in two 256 MB DIMMs; one in each of the memory slots.

The maximum amount of RAM you can install in the iMac is 2 GB total (a 1 GB SO-DIMM in each of the two slots). You can use small-outline dual inline memory modules (SO-DIMMS) of 512 MB or 1 GB that meet all of these criteria:

- PC2-5300
- unbuffered
- nonparity
- 200-pin
- 667 MHz DDR2 SDRAM

DIMMs with any of the following features are not supported in this iMac:

- registers or buffers
- PLLs
- ECC
- parity
- EDO RAM

Always follow the upgrade instructions for memory installation as written. Never attempt to remove screws that are not listed in the upgrade instructions.

Published Date: Oct 11, 2016

About the iMac (Early 2006) and iMac (Late 2006) Mini-DVI video out port

This article has been archived and is no longer updated by Apple.

Using your iMac (Early 2006) or iMac (Late 2006) computer's Mini-DVI video out port, you can mirror the built-in display video on an external display or extend the size of your Mac OS X desktop (extended desktop mode) by connecting a compatible DVI display, VGA display, or projector and the appropriate Apple Mini-DVI adapter:

- For DVI displays, use the Apple Mini-DVI to DVI Adapter (M9321G/B).
- For VGA displays or projectors use the Apple Mini-DVI to VGA Display Adapter (M9320G/A).
- For televisions, projectors or VCRs that use S-video or composite video connectors, use the Apple Mini-DVI to Video Adapter (M9319G/A).

What choices do I have?

Video mirroring allows you to view the image displayed on the iMac's flat-panel display on an external monitor, television or projector.

Extended desktop mode allows you to use the screen area on an external display in addition to the display in your computer.

You can switch between mirroring and extended desktop mode by opening System Preferences and clicking 'Displays'. Click the Arrangement button to set your primary display.

Connecting an external display is designed to be "plug and play". Simply turn on your external display or projector, and connect the appropriate adapter to the display (see above). Then connect the adapter to the Mini-DVI port located on the back of the iMac.
Tip: To make sure that your iMac automatically detects the external display or projector, be sure you plug the adapter into the external display or projector before you plug it into the iMac.

Resolutions

When you connect the adapter to the computer, the screen may refresh momentarily as the computer prepares itself for the new video output. When the computer is mirroring video, it tries to synchronize the resolution of the built-in and external displays. If they can't be matched, the computer will change the resolution of both screens to the highest common resolution which may cause areas of the built-in display to be blacked out.

You can switch resolutions and frequencies for both the iMac internal display and the external display, television, or projector using the Displays pane of System Preferences.

To display a a DVD movie disc on a television that's connected to your iMac, select a 720 x 480 NTSC (in the United States) or 720 x 576 PAL (in Europe and other regions) resolution in the Displays pane of System Preferences.

Tip: Because of the display limitations of most televisions,the images displayed on a television screen are usually not as high quality as those on the built-in display or an external monitor.

About the security content of QuickTime 7.0.4

This article has been archived and is no longer updated by Apple.

This document describes the security content of QuickTime 7.0.4, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

QuickTime 7.0.4

The following issues are addressed in QuickTime 7.0.4, and affect QuickTime 7.0.3 and earlier versions.

- **QuickTime**

  CVE-ID: CVE-2005-2340

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: A maliciously-crafted JPEG image may result in arbitrary code execution

  Description: By carefully crafting a corrupt JPEG image, an attacker can trigger a heap buffer overflow which may result in arbitrary code execution. This update addresses the issue by performing additional validation of JPEG images. Credit to Varun Uppal of Kanbay, Dennis Rand of CIRT.DK, and Fang Xing of eEye Digital Security (eeye.com) for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2005-3707, CVE-2005-3708, CVE-2005-3709

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted TGA image may result in arbitrary code execution

  Description: By carefully crafting a corrupt TGA image, an attacker can trigger a buffer overflow, integer overflow, or integer underflow that may result in a denial-of-service or arbitrary code execution. This update addresses the issue by performing additional validation of images. Credit to Dejun Meng of Fortinet for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2005-3710, CVE-2005-3711

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted TIFF image may result in arbitrary code execution

  Description: By carefully crafting a corrupt TIFF image, an attacker can trigger an integer overflow which may result in a denial-of-service or arbitrary code execution. This update addresses the issue by performing additional validation of TIFF images. Credit to Dejun Meng of Fortinet for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2005-3713

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: A maliciously-crafted GIF image may result in arbitrary code execution

  Description: By carefully crafting a corrupt GIF image, an attacker can trigger a heap buffer overflow which may result in arbitrary code execution. This update addresses the issue by performing additional validation of GIF images. Credit to Karl Lynn of eEye Digital Security (eeye.com) for reporting this issue.

- **QuickTime**

TA23845_About_the_security_content_of_QuickTime_.pdf

CVE-ID: CVE-2005-4092

Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

Impact: A maliciously-crafted media file may result in arbitrary code execution

Description: By carefully crafting a corrupt media file, an attacker can trigger a heap buffer overflow which may result in arbitrary code execution. This update addresses the issue by performing additional validation of media files. Credit to Karl Lynn of eEye Digital Security (eeye.com) for reporting this issue.

QuickTime 7.0.4 may be obtained from the Software Update pane in System Preferences, or from the Download tab in the QuickTime website.

iWeb: Linking text to a file will change the text

This article has been archived and is no longer updated by Apple.

In iWeb, you can link text in your site to another webpage, to a file, or to an email message by selecting the text and selecting the "Enable as a hyperlink" checkbox in the Link Inspector.

However, if you link text to a file, the text will be replaced with the name of the file that the link points to.

For instance if you selected the text here from a sentence which reads "Download cupcake recipe here" and then linked it to a file called cupcake.rtf, the sentence will change to "Download cupcake recipe cupcake.rtf".

You can change the file name text by selecting the link (make sure the "Make all hyperlinks active" checkbox in the Link inspector is deselected) and adding new text in it's place.

This document will be updated as more information becomes available.

Published Date: Oct 11, 2016

About the Xsan 1.3 Update

This article has been archived and is no longer updated by Apple.

Four different software updates are available for Xsan 1.3. These updates apply to Mac OS X client and Server versions 10.3.9 and later.

Installation

Both Software Update and Apple Downloads offer these updates:

- Xsan 1.3 Update for 10.4
- Xsan 1.3 Update for 10.3.9

  Note: Of the two updates above, you only need to install the one that corresponds to your operating system version.

- Xsan Admin 1.3 Update

  Note: Required for Xsan 1.3 administration and recommended for Xsan 1.0 administration, this update only needs to be installed on admin computers.

- Xsan 1.3 Uninstaller

Important Notes: Read Before Continuing

1. **Before Installation**
   - For the Xsan 1.3 Update for 10.3.9 and the Xsan 1.3 Update for 10.4, you must already be running Xsan 1.2. If you're not on Xsan 1.2 yet, stop now and update to 1.2 before continuing.
   - If you are setting up a new Xsan deployment, please see this article for the proper installation order.
   - During the installation, do not make any changes to Xsan settings using Xsan Admin or the command-line tools.
   - Be sure that all MDCs are updated before you make any configuration changes.

2. **After Installation**
   To avoid a certain stability issue over the long term, you should run the cvfsck command on each Xsan volume, after the MDCs have been updated with Xsan 1.3 Update for 10.3.9 or Xsan 1.3 Update for 10.4. Before continuing, please see the full explanation here.

3. **Metadata Controller (MDC) software version**
   Whether you are running Panther or Tiger systems, your MDCs must always have software versions (both Xsan and Mac OS) that are equal to or more recent than the most recent client versions. Specifically, that means: If any client in your Xsan network is running Xsan 1.3 on Mac OS X 10.4.5 or later, then your metadata controllers (MDCs) must also be updated to Xsan 1.3 on Mac OS X 10.4.5 or later; If any client in your Xsan network is running Xsan 1.3 on Mac OS X 10.3.9, then the MDC must run Xsan 1.3 on 10.3.9.

Software Update Installation

Software Update may have referred you to this document. Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates (learn more).

Standalone Installer

A standalone installer is also available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

System Hardware Requirements

- Xserve or Xserve G5
- Power Mac G4 (dual 800MHz or faster)
- Power Mac G5 (any model)

Storage Network Requirements

- Apple Fibre Channel PCI, PCI-X, or PCI-E Card

Compatibility Matrix

See "Xsan: Compatibility of SAN clients with Xsan and StorNext controllers."

What's New in XSan 1.3

Xsan 1.3 Update for 10.4

The Xsan 1.3 update delivers overall improved reliability for Xsan and is recommended for all systems running 10.4. It includes fixes for:

- labeling and initializing LUNs greater than 2TB in size
- preventing labeled LUNs from becoming unlabeled
- improving AFP performance when re-sharing Xsan volumes
- more accurate file permissions when sharing Xsan volumes via AFP
- accessing Xsan volumes larger than 16TB in size
- greater server stability when re-sharing Xsan volumes via NFS
- handling quotas with no associated user or group name
- maintaining access to Xsan volumes when metadata controller failovers occur
- providing metadata controller services to Mac OS X 10.3.9 and 10.4 systems running Xsan 1.3
- operating Xsan in environments with a mix of Mac OS X 10.3.9 and 10.4 systems
- an issue with storing PostgreSQL 8.0 and 8.1 database files on Xsan volumes
- intermittent issues that can occur when storing NetVault Virtual Disk Library (VDL) files on an Xsan volume
- an issue in which free space and volume sizes were incorrectly reported when sharing volumes with Helios server software.

Important Note: Volumes containing initialized LUNs greater than 2TB can only be used with Xsan 1.3 systems running Mac OS X v10.4.5 or later. Xsan does not support LUNs larger than 2TB on Mac OS X v10.3.9 or systems running StorNext version 2.6.

Warning: Do not use Disk Utility in Mac OS X 10.4.5 to edit Xsan volumes—Learn More.

Software requirements for this update are:

- Mac OS X or Mac OS X Server 10.4.5 or later
- Xsan 1.2

Xsan 1.3 Update for 10.3

The Xsan 1.3 update delivers overall improved reliability for Xsan and is recommended for all systems running 10.3.9. It includes fixes for:

- preventing LUNs from becoming unlabeled
- improved file system reliability when working with 2TB truncated LUNs
- greater server stability when re-sharing Xsan volumes via NFS
- handling quotas with no associated user or group name
- maintaining access to Xsan volumes when metadata controller failovers occur
- operating Xsan in environments with a mix of Mac OS X 10.3.9 and 10.4 systems
- intermittent issues that can occur when storing NetVault Virtual Disk Library (VDL) files on an Xsan volume
- an issue in which free space and volume sizes were incorrectly reported when sharing volumes with Helios server software.

Important Note: If your Xsan network has any volumes that use LUNs greater than 2TB, all Panther clients must be updated to Xsan 1.3.

Software requirements for this update are:

- Mac OS X or Mac OS X Server version 10.3.9
- Xsan 1.2

Xsan Admin 1.3 Update

The Xsan 1.3 update delivers overall improved reliability for remotely administering, configuring, and maintaining Xsan deployments. It includes fixes for:

- labeling and initializing Fibre Channel LUNs larger than 2TB in size
- growing Fibre Channel storage pools and volumes
- working with multiple Xsan metadata controllers in a heterogeneous environment
- displaying progress messages while performing lengthy operations
- preventing manually modified configuration settings from being overwritten during a save
- accurately reporting Fibre Channel multipathing errors

Xsan 1.3 Uninstaller

TA23847_About_the_Xsan_Update.pdf

This uninstaller will remove Xsan from your computer. It will also remove the Xsan Admin application and documentation files.

Before removing Xsan, you should back up all of your data and volumes, and unmount all Xsan volumes.

Documentation

Xsan 1.3 administrators can continue to reference the Xsan 1.1 documentation here.

Mac OS X 10.4: Preview - "Zoom To Selection" displays blank window in PDF documents

This article has been archived and is no longer updated by Apple.

The Zoom To Selection button can be added to the Preview toolbar via the **View** menu's **Customize...** choice (available when a document is open in Preview). If you haven't added this button to your Preview toolbar, you won't need this article.

When you open a PDF document and press the Zoom To Selection toolbar button after using the Select Tool to define a specific portion of the page, the zoomed-in view will show the selected area as expected.

However, if you don't make a selection from the PDF before clicking the Zoom To Selection button, a blank page appears instead, and you will be unable to view or manipulate the document further until you close and open it again.

Solution

Close the document, and reopen it to view it again.

Remember to always select an area of the PDF document with the Select Tool (or just by holding your mouse button as you drag over an area of the PDF document) before clicking Zoom To Selection.

Or, remove the Zoom To Selection button that you previously added, and use the **View** menu's **Zoom To Selection** choice instead (this choice is dimmed when it cannot be used).

This document will be updated as more information becomes available.

iDVD 6: Background assets may not appear after opening older iDVD projects

This article has been archived and is no longer updated by Apple.

Background assets may not appear when opening older iDVD projects in iDVD 6. For instance, if you open an iDVD 3 or iDVD 4 project in iDVD 6.0, your background assets do not display.

To resolve this issue, update to iDVD 6.0.4 or later.

For more information on importing background assets in iDVD 6, see the following topics in Help:

- Changing the Background image of a DVD menu
- Using your own video in a menu background

Photo album names with double-byte characters may not appear correctly on Fifth Generation iPod

This article has been archived and is no longer updated by Apple.

If the name of an album in iPhoto or the name of a folder you selected to sync contains some double-byte characters such as Japanese, Korean, or Chinese, those characters will not synchronize properly to a Fifth Generation iPod. Some characters of a photo album name on a Fifth Generation iPod might be displayed smaller than other characters when synchronized with iTunes.

Try renaming the photo album in iPhoto or the folder to a name that does not include the character that is not synchronizing properly. Or you can use a single-byte (Roman) character set to prevent this from occurring.

This document will be updated as more information becomes available.

Logic Pro 7: Audio file not found when loading GarageBand instrument

This article has been archived and is no longer updated by Apple.

On a custom installation of Logic Pro, loading certain GarageBand instruments may invoke an alert message that says some audio files can't be found.

This can happen if you do not select the option for Logic Pro Bonus Sound Library or GarageBand 2 Sound Library. Rerun the Logic Pro Installer, and select both of those options this time.

GarageBand: Kotoeri character palette disabled after creating an effect preset

This article has been archived and is no longer updated by Apple.

The Kotoeri Character palette becomes inactive after you create an effects preset in GarageBand.

On Japanese systems, this occurs in GarageBand versions 1 and 2. In GarageBand 3, the issue does not occur if you select "Use One Input Source in all documents." To do that:

1. From the **Apple** menu, choose **System Preferences**.
2. Select the International pane.
3. Click the Input Menu tab.
4. Select the radio button for "Use One Input Source in all documents."

Aperture: A large image "could not be located" when sending to external editor

This article has been archived and is no longer updated by Apple.

If you select a very large image and use the Open With External Editor command, you may get an alert message saying that the image can't be found. If your designated editor was Adobe Photoshop CS2, for example, the message would say:

> **Edit in Adobe Photoshop CS2 Alert**
>
> The selected image file could not be located and so cannot be exported to Adobe Photoshop CS2.

The text of this message does not state the actual reason, but this happens because there is a size limit for images being sent to an external editor. The size limit varies with your system configuration and is well in excess of file sizes created by supported digital cameras. You might see this, for example, if you import a very large scanned image. In general, images up to about 250MB should work on any Aperture-supported system.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

AirTunes: Base station "used by someone else" message appears in iTunes when using multiple speakers

This article has been archived and is no longer updated by Apple.

If you try to play audio in iTunes to two different AirPort Express base stations, and the base stations are on different networks, you may see this alert message:

> "The remote speaker is currently being used by someone else. Please select another speaker from the menu at the bottom of the iTunes window."

This issue affects iTunes 6.0.2 and AirPort Express, and it happens when the AirPort Express base stations have the same IP address on different networks.

The key to avoiding this issue is to set up a valid network controlled by only one router. If you have one AirPort Extreme acting as the primary router, for example, it would not assign the same IP address to two other devices in the network. However, this may happen if you have multiple routers active.

To achieve a single network, AirPort Express units should join the network in client mode, WDS mode, or be used as part of a roaming network (in which multiple base stations connect to a central Ethernet "backbone" that is routed by the primary router, which could be an AirPort Extreme, for example). For help with more complex setups like roaming, please see Apple Manuals.

This document will be updated as more information becomes available.

Using Mac OS X Server 10.4 with Intel-based Mac OS X systems

This article has been archived and is no longer updated by Apple.

The shrink-wrap retail version of Mac OS X Server 10.4.7 (Universal) supports Intel-based Macintosh computers that meet the system requirements (http://www.apple.com/server/macosx/specs.html). **Note**: You cannot install earlier versions of Mac OS X Server on Intel-based Macintosh computers.

Intel-based Mac OS X clients can connect to PowerPC-based Macs running any version of Mac OS X Server.

The Server Admin Tools for Mac OS X Server 10.4.7 can also be installed on Intel-based Macintosh computers with Mac OS X 10.4.4 or later. For more information, see this article. A PowerPC-based Mac running Mac OS X Server 10.4.4 or later can host NetBoot and Netinstall images for Intel-based Mac clients. For more information, see this article.

Mac OS X 10.3: Repair Disk Permissions "Disk Utility has lost its connection with the Disk Management Tool..." alert

This article has been archived and is no longer updated by Apple.

After installing iTunes 6.0.2 or later in Mac OS X 10.3 through 10.3.9, Disk Utility's Repair Disk Permissions may not finish, and the following alert appears in the Disk Utility window:

"Disk Utility has lost its connection with the Disk Management Tool and cannot continue. Please quit and relaunch Disk Utility."

(Quitting and reopening Disk Utility does not help.)

The following also appears in Console log:

```
*** malloc[419]: Deallocation of a pointer not malloced: 0x290a410; This could be a double free(), or free() called with the middle of an allocated block; Try setting environment variable MallocHelp to see tools to help debug : for architecture i386 object: ./Applications/iTunes.app/Contents/MacOS/iTunes malformed object (unknown flavor for flavor number 0 in LC_UNIXTHREAD command 27 can't byte swap it)
```

Workaround

1. Quit Disk Utility.
2. From the Finder's Go menu, choose **Go to Folder...**.
3. Type the following, then click OK: /Library/Receipts
4. Temporarily remove these iTunes receipts from /Library/Receipts (sort the folder alphabetically as a list):

    - iTunes.pkg
    - iTunes4.pkg

    You can put them on the desktop, for example. Do not remove iTunesX.pkg or iTunes Phone Driver.pkg.
5. Open Disk Utility and repair disk permissions again.
6. Quit Disk Utility.
7. Put the removed iTunes receipts back in /Library/Receipts.

Note: This issue does not affect Disk Utility's verify or repair *disk* features.

Mac OS X 10.4: Software Update "The digital signature for this package is incorrect" alert

This article has been archived and is no longer updated by Apple.

If you encounter the message "The digital signature for this package is incorrect" while using Software Update in Mac OS X 10.4 Tiger, try the following steps:

1. Quit Software Update.
2. Restart your Mac.
3. Open Software Update.
4. Deselect all available updates, except for any Mac OS X 10.4.x Update.
5. Install the Mac OS X 10.4.x Update, if available (it should install), and restart.
6. Open Software Update, and install any remaining updates.

If the issue occurs while attempting the Mac OS X 10.4.x Update, download the update from Apple Downloads and manually install it. After restarting, try using Software Update to install any remaining updates.

This document will be updated as more information becomes available.

Published Date: Feb 19, 2012

iPhoto 6 can‘t open due to permissions alert

This article has been archived and is no longer updated by Apple.

If items in your iPhoto Library belong to a different user, you may not be able to open or upgrade your iPhoto Library. When you try to open iPhoto 6, you get an alert message that says:

> "There is a problem accessing one or more files in your iPhoto Library folder. In the Finder select the iPhoto Library folder. Then choose File > Get Info. Make sure you have read and write permissions for the folder and then apply this setting to all enclosed items."

Note: This does not indicate a need to run the Repair Permissions function of Disk Utility.

For Mac OS X 10.4.3 or later

If you are using Mac OS X 10.4.3 or later, use these steps to correct the issue:

1. Locate the iPhoto Library folder in the Finder. It usually located in your Pictures folder.
2. Select the iPhoto Library, then choose **File > Get Info**.
3. In the Info window, be sure that the checkbox for "Locked" is not selected.
4. Click the disclosure triangle next to Ownership & Permissions, as well as the one for Details (if it is not already open).
5. Make sure you are the owner of this folder and have read/write permission. If not, click the lock icon next to the owner name.
6. If prompted to authenticate, enter an administrator username and password.
7. Change the Owner and Owner Access settings if needed so that you are the owner and the access for the owner is Read & Write.
8. Click the button that says Apply to Enclosed Items.
9. If prompted to authenticate, enter an administrator username and password.
10. At the next prompt, click OK.

You should now be able to open iPhoto and use your iPhoto Library.

Note: If you get an alert message on the same file again, be sure that the enclosing folder is not locked. You can check the folder using the Info window just as you did for the file. Also, be sure there are no locked files in your iPhoto library.

For Mac OS X 10.3.9

If you are using Mac OS X 10.3.9, note the filename that is outlined in the alert message ("The item that failed is..."). Use these steps to correct the permissions on that file:

1. From the Finder, locate the file mentioned in the alert message.
2. Select the file, then choose **File > Get Info**.
3. In the Info window, be sure that the checkbox for "Locked" is not selected.
4. Click the disclosure triangle next to Ownership & Permissions, as well as the one for Details (if it is not already open).
5. Make sure you are the owner of this folder and have read/write permission. If not, click the lock icon next to the owner name.
6. If prompted to authenticate, enter an administrator username and password.
7. Change the Owner and Owner Access settings if needed so that you are the owner and the access for the owner is Read & Write.
8. Click the button that says Apply to Enclosed Items.
9. If prompted to authenticate, enter an administrator username and password.

Try opening iPhoto again. If you still receive the alert message, look at the filename mentioned in the alert and repeat the steps above.

Note: If you get an alert message on the same file again, be sure that the enclosing folder is not locked. You can check the folder using the Info window just as you did for the file. Also, be sure there are no locked files in your iPhoto library.

Sharing iPhoto Library not recommended

Attempting to edit your iPhoto Library from multiple users on the same machine can introduce this issue. This could happen, for example, if you move the iPhoto Library to /Users/Shared and then attempt to open this library from more than one user account on the same computer. This is not recommended.

iMac (Early 2006): External ports and connectors

This article has been archived and is no longer updated by Apple.

Here we'll describe the external ports and connectors on the iMac (Early 2006) computer. You can find them on the bottom right side of the back of the computer, known as the Input/Output (I/O) panel.

Ports and connectors

1. Mini-DVI video output port
2. Ethernet Port (10/100/1000 Gigabit Base-T)
3. Audio line-in port
4. Headphone out / optical audio out port
5. USB 2.0 ports (three ports)
6. FireWire ports (two ports)

Mini-DVI video output port

Using the Mini-DVI video out port, you can use a compatible DVI display, VGA display or projector in extended desktop or video mirroring mode with the appropriate Apple Mini-DVI adapter.

- For DVI displays, use the Apple Mini-DVI to DVI Adapter (M9321G/A).
- For VGA displays or projectors use the Apple Mini-DVI to VGA Display Adapter (M9320G/A).
- For televisions, projectors or VCRs that use S-video or composite video connectors, use the Apple Mini-DVI to Video Adapter (M9319G/A).

Video mirroring allows you to see the same image that is on the iMac (Early 2006) computer's flat-panel display on an external monitor, television or projector.

Extended desktop mode allows you to connect an external display and use that area in addition to the built-in display for your desktop.

For more information, see About the iMac (Early 2006) Mini-DVI video out port.

Ethernet Port (10/100/1000 Gigabit Base-T)

The iMac (Early 2006) has a built-in 10/100/1000 Gigabit Ethernet port. The iMac (Early 2006) computer can be connected to an Ethernet cable from a cable or DSL modem, hub, switch, or router, or to another Macintosh computer. The connected device can be either a 10Base-T, 100Base-T or a 1000Base-T device; the port automatically detects which type of device is connected. You don't have to use an Ethernet crossover cable to connect to other Ethernet devices.

Audio Line-in Port

Analog audio line input minijack; up to 16-bit stereo and 44.1 kHz sampling rate.

The external sound input jack is a 3.5 mm mini phone jack. The sound input jack accepts line-level stereo signals. It also accepts a stereo miniplug-to-RCA cable adapter for connecting stereo equipment to the computer.

The iMac (Early 2006) also has a built-in microphone near the built-in iSight camera at the top of the computer screen bezel.

Headphone out / optical audio out port

The headphone / line output jack accommodates both digital optical audio output and analog audio output with a 24-bit, 16-96 kHz D/A converter. For analog headphone / line output a standard audio cable with 3.5mm metal plug should be used. For digital audio, a fiber optic cable with 3.5mm plastic or nylon optical plug should be used.

Three USB (Universal Serial Bus) 2.0 Ports

The back of the iMac (Early 2006) has a total of three USB 2.0 compliant ports. You can connect both USB 2.0- and USB 1.1-compliant devices to these ports. The keyboard also contains a USB hub with two USB 1.1-compliant ports.

All the USB ports use USB Type A connectors, which have four pins each.

The USB 2.0 ports support both low-speed, full-speed and high-speed data transfers, at up to 1.5 megabits per second (Mbit/s), 12 Mbit/s, and 480 Mbit/s respectively.

Two FireWire 400 Ports

The iMac (Early 2006) features two 400 Mbit/s FireWire (IEEE 1394) ports. 400 Mbit/s is a theoretical maximum load, and actual rates will vary. This port is used by iPods, as well as third-party devices such as video cameras or external drives.

The iMac (Early 2006) computer supports Target Disk Mode (TDM).

iDVD 6: Photos are missing from iDVD project after upgrading

This article has been archived and is no longer updated by Apple.

After you open a project in iDVD 6 that you created in an earlier version of iDVD, an alert indicates that photos used in slideshows, backdrops, or drop zones are missing. You may be prompted to locate the missing items.

To prevent this issue from occurring, update to iDVD 6.0.4 or later.

If you have an affected project, you have two options:

- Click the Find File button in the alert window to locate the missing item(s).

  Tip: Try pointing to the root folder of the updated iPhoto 6 Library (~/Pictures/iPhoto Library). This will let iDVD search the entire library and should work well provided file names are unique.

- Use the Media pane in iDVD 6 to re-create the slideshow, or to reimport the missing elements.

Tip: If you have opened this existing project because you want to burn another copy, and you don't plan to make any changes to the project — remember that you can also make a copy of this project if you have a DVD of it that you have previously burned. See "How to copy previously-burned DVD-R video discs" for details.

Motion project media goes offline in Final Cut Pro project

This article has been archived and is no longer updated by Apple.

You can exchange clips and sequences between Final Cut Pro and Motion. When using both on the same computer, they integrate so tightly that you can work with a Motion project in both applications at the same time, without having to worry about moving files between applications.

If a media file you used in a Motion project is moved to a different location on your hard disk, that element won't appear in the Motion clip that is embedded in your Final Cut Pro project.

Normally, when clips go offline in Final Cut Pro, you will get an Offline Files message when you open your project. Offline files in Final Cut Pro will display a red background with the text "Media Offline" when displayed in the Viewer or Canvas.

However, if an element in your Motion project has gone offline, you will see a red and white checkerboard pattern and will not get an Offline Clip warning in Final Cut Pro.

If this happens, open the Motion project (Control-click the Motion clip in your Final Cut Pro sequence and choose **Open in Editor** from the shortcut menu). Motion will prompt you to reconnect the missing media. After you reconnect, save the Motion project. When you switch back to Final Cut Pro, the clip will display correctly.

Mac OS X Server 10.4: Direct group membership required for computer list access restrictions

This article has been archived and is no longer updated by Apple.

When restricting login for a computer list to specific groups in Workgroup Manager, a user whom you wish to grant login privileges must have direct membership in a group listed in the computer list's access list. Membership in a group that's nested within a listed group is not adequate.

To avoid this issue, add all your nested groups to the access list.

Mac OS X Server 10.4: Applying Directory Services settings in System Image Utility

This article has been archived and is no longer updated by Apple.

The "Apply directory services settings from this machine to all clients" option in System Image Utility allows you to duplicate Directory Services settings from the computer you're working on to a NetBoot/NetInstall image.

To use the "Map clients to other directory servers" feature in System Image Utility, you must set up authenticated directory binding in Directory Access on the computer on which you are running System Image Utility.

To create an authenticated bind for the LDAPv3 plugin, first set up a connection in the LDAPv3 plugin in Directory Access, then supply a unique computer name and server administrator credentials when prompted.

If you have set up LDAPv3 Directory Services settings without Authenticated Binding, and you attempt to copy the settings in System Image Utility, you will receive this alert message:

> "No local bindings found This machine is not bound to a directory server. Per CPU bindings can not be set."

Published Date: Feb 19, 2012

iWeb: Template text appears as Latin or gibberish

This article has been archived and is no longer updated by Apple.

When you choose a template in iWeb, much of the text in the initial page may appear to be in Latin or come across as gibberish.

This is normal behavior for iWeb. The initial text in any template is there to give you an idea of how the final webpage will look. To change it, click once on the section of text that you wish to change, and start typing.

About Mac OS X Server 10.4.5 Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server 10.4.4 to version 10.4.5.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.5. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.5: Use Software Update or install from a standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates. There is no "combo" version available for the Mac OS X Server 10.4.5 Update, so your server must be running version 10.4.4 before Software Update will prompt you to install the 10.4.5 update.

Standalone Installer

A standalone installer is also available from Apple Downloads. The Mac OS X Server 10.4.5 Update specifically updates version 10.4.4 to version 10.4.5.

There is no "combo" version available for the Mac OS X Server 10.4.5 Update, so be sure your server is running version 10.4.4 before launching the 10.4.5 Installer.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Improvements

Some of the improvements included in the Mac OS X Server 10.4.5 Update are:

- Time zone and daylight saving changes for 2006 and 2007.
- **MySQL:** Addresses a potential crash which may occur when processing large amounts of data in MySQL.
- **SMB:** Addresses an issue with using and mounting Windows-formatted storage devices.

Published Date: Oct 11, 2016

About the Mac OS X Server 10.4.6 Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server 10.4.5 to version 10.4.6.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.6. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.6: Use Software Update or install from a standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is also available from Apple Downloads. The Mac OS X Server 10.4.6 Update specifically updates version 10.4.5 to version 10.4.6. There is also a "Combo Update" installer available, which will update any version of Mac OS X Server 10.4 to 10.4.6.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Improvements

Apple File Services

- Addresses an issue that prevented the Autosave function of Microsoft Word from working for users of AFP home directories.
- Users other than the owner can now set Finder labels on items on an AFP volume. **Note:** Label changes to folders may not appear immediately.
- Addresses an issue in which undeletable Burn Folders could be created when burning discs from an AFP home directory.
- Mac OS X 10.4 clients can now copy or duplicate folders on a Mac OS X Server 10.3 AFP volume, including drop boxes.
- Finder windows now promptly reflect changes made on an AFP volume.
- Includes an updated version of Microsoft UAM, which improves AFP authentication on Intel-based Macs.

CoreGraphics

- Addresses an issue in which Apple Remote Desktop clients stop updating the admin's control screen.

Directory Access Plugins

- Addresses Active Directory binding issues in which the first bind attempt may fail but the second attempt succeeds.
- Addresses issues for authenticating non-Kerberos SMB clients to an Active Directory-bound Mac OS X Server.
- Addresses performance and delay issues with large-scale NetInfo deployments.

DNS

- Improved reverse zone entry management, including adding secondary reverse zones via Server Admin.
- Improved behavior for DNS servers when hostname is been changed or corrected.
- The changeip command line utility now accepts and requires fully qualified domain names when updating a server's hostname (learn more).

FTP

- Addresses a potential memory leak during heavy usage.

Gateway

- Addresses issues in which VPN and DHCP services may not automatically start or be configured correctly after running the Gateway Setup Assistant.

Launchd

- Addresses an issue that prevents periodic scripts from running at the wrong time or at all.

Mail Services

- Addresses a potential memory handling issue which could cause imapd to become unresponsive during file system writes.

Managed Client

- Members of nested groups are able to log in when access is restricted to specific groups.
- Addresses an issue that allows users to connect to an AFP volume when access to applications is restricted.
- Scheduled shutdown now applies to clients at the Login Window when no other users are logged in.
- Addresses an issue that prevents the Keychain from updating correctly when network users change passwords during login.

NetBoot, NetInstall, and System Imaging

- Added latest hardware releases and improvements to Model Filters within System Image Utility.
- Addresses an issue that System Image Utility may have with some DVD media during image creations.

NFS

- Improves startup performance for some NFS-based applications.
- Resolves a permissions issue for NFS clients that was introduced with Mac OS X 10.4.
- Addresses potential kernel panics which could occur in the following conditions:
  - Users writing or copying files larger than 2GB.
  - NFSv2 clients launching certain applications with NFS Home Directories.
  - Large deployment NFS Home Directory Servers under heavy TCP loads.

Open Directory

- Improved Open Directory performance for large scale deployments.

Password Server

- Addresses an issue in which Password Server may not update new user or password change requests during replication.
- Improved performance during domain logins.

Printing

- Improved Reset Print Quota behavior.
- Improved print quotas for USB printers.
- Improved reliability and memory handling of servermgr_print service.

SMB

- Improved SMB SACL permissions for Kerberos users.
- Addresses a potential file copy issue that prevents Windows clients from copying folders (containing multiple files) to the SMB server sharepoint.
- Addresses file saving issues with Microsoft Office products on SMB shares, including a potential kernel panic when saving files which have large names (255 characters).

- Addresses an issue that prevents Windows clients from correctly resolving group access using distinguished names.
- Improved SMB authentication performance for Windows clients.

Web Services

- Web server and WebDAV realm permissions now honor Active Directory group memberships.
- Addresses an issue that prevents Weblog server from publishing Podcast AV (.m4b/.m4v) files.
- Addresses an issue that prevents some Active Directory users from accessing Weblogs.

Workgroup Manager

- Addresses an issue in which imports containing user records with multiple shortnames would not preserve second and subsequent short names.
- Sharing Pane now propagates permissions into bundled data files.
- Addresses an issue in which custom home directory configurations may not autocomplete properly.
- Disk quotas for home directories are no longer limited to 2GB.

About Mac OS X Server 10.4.6 Update (Combo)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server versions 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, and 10.4.5 to Mac OS X Server 10.4.6. It is a "combo" update that combines enhancements delivered with versions 10.4.1 through 10.4.6. If you already have Mac OS X Server 10.4.5, you can download a smaller update to update to version 10.4.6.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.6. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.6: Use Software Update or install from the standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Note: This version of Mac OS X Server is built as a multi-package and should not be used with Software Update's "Download Only" and "Install and Keep Package" options. If you need to save these packages for later use, try the manual update instead.

Standalone Installer

A standalone installer is also available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Enhancements delivered with this update

This update delivers many enhancements. Because this is a combo update, it includes enhancements that are delivered with the prior 10.4.x updates. You can see the individual enhancement lists for 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, and 10.4.6 updates.

iTunes 6 for Mac: Dragging text into Lyrics field uses text from Clipboard instead

This article has been archived and is no longer updated by Apple.

In iTunes 6, if you drag a selection of text into the Lyrics field of the Info window for a song, the contents of the Clipboard are used instead. The Clipboard is a temporary holding place for text, graphics, and other objects cut or copied using the Cut or Copy menu items in the Edit menu.

Instead of dragging, use Copy and Paste to add lyrics to your songs.

This document will be updated as more information becomes available.

Logic Pro/Express 7.2, GarageBand 3: Some Audio Units not available on Intel-based Macs

This article has been archived and is no longer updated by Apple.

When using a Universal version of Logic, GarageBand, or any other application that supports Audio Units on an Intel-based Macintosh, PowerPC versions of Audio Unit plug-ins are not available. All plug-ins must be compiled for Intel, so you should consult with the manufacturer of the plug-in to see about obtaining a Universal version.

Note: Users facing this scenario with large collections of PowerPC-compatible plug-ins may be tempted to force a Universal application to run under Rosetta. You should **avoid** this temptation and allow the Universal application to run natively on the Intel-based Mac as designed.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Videos labeled TV Shows in iTunes don‘t appear on iPod

This article has been archived and is no longer updated by Apple.

Issue or Symptom

iTunes 6.0.2 or later includes an option to select "TV Show" as a "Video Kind" for videos that were **not** purchased from the iTunes Store.

While iTunes will respect this selection, you will not be able to see those videos listed on your iPod by selecting Videos > TV Shows. TV Shows purchased from the iTunes Store will show up as expected.

Solution

To make these videos visible as TV Shows on your iPod, follow the steps below:

1. Update to iTunes 7.0 or later.
2. Select the affected video and choose **Get Info** from the **File** menu.
3. In the Video tab, select **TV Show** and then make sure that at a minimum a value is entered in the **Show** field.
4. You can optionally enter values for **Episode ID, Episode Number and Season Number**
5. Click **OK** and resync your iPod

Sharing Full Quality HDV from iMovie HD does not export correct aspect ratio (1920 x 1080, 16:9)

This article has been archived and is no longer updated by Apple.

After completing your edit of an HDV 1080i widescreen project in iMovie HD 6, you can export a QuickTime movie by choosing **Share** > **QuickTime**. You can also choose **File** > **Export** and then click the QuickTime icon.

If you choose the Full Quality option from the **Compress movie for** pop-up menu, you can export a full resolution QuickTime movie for use in iDVD or other applications.

When you import the resulting QuickTime movie into an iDVD project, the video will incorrectly be displayed with a 4:3 aspect ratio (instead of 16:9) when imported to iDVD 6 widescreen project.

Updating to iDVD iDVD 6.0.4 or later will allow iDVD 6 to import the video correctly. If you have another application you want to use the exported file with (or just want to view it with the 16:9 aspect ratio in QuickTime Player, then use one of the following workarounds.

Workarounds

There are two workarounds, one you can use if you have QuickTime Pro and one you can use in iMovie HD.

QuickTime Pro

1. In iMovie HD, export your movie using **Share** > **QuickTime**.
2. In the **Compress movie for** pop-up menu choose **Full Quality** and click Share. Type a name for the movie and click Save.
3. Open the your movie in QuickTime Player.
4. From the **Window** menu, choose **Show Movie Properties**.
5. In the Properties window, select the Video track.
6. Select the Visual Settings button. (If you do not see the Visual Settings button, try selecting the Audio track, then reselect the Video track to refresh the button display.)
7. Deselect the Preserve Aspect Ratio checkbox.
8. Set the Scaled Size settings to 1920 x 1080 pixels.

   If your movie was not already at 1920 x 1080, you should see it change its shape slightly after entering the dimensions "1920" and "1080" in the Scaled Size fields. If your movie doesn't take the adjustment:
   - Press the Tab key on your keyboard to make sure that the numbers are registered after you typed them.
   - If your movie has tracks other than Audio and Video listed in the upper portion of the Properties Window (such as timecode tracks or hint tracks), disable them by unchecking the corresponding boxes for any tracks other than Audio, Video and Quartz Composer tracks.

9. Close the Properties window.
10. Save the movie (from the **File** menu, choose **Save**.

iMovie HD

1. In iMovie HDchoose **Share** > **QuickTime**.
2. In the **Compress movie for** pop-up menu choose **Expert Settings**.

3. Click Share button.
4. From the **Export** pop-up menu, choose **Movie to QuickTime Movie**.
5. In the "Save exported file as" dialog, click Options button.

6. In the Video section of the Movie Settings window, click Settings.

7. From the **Compression Type** pop-up menu, choose **Apple Intermediate Codec**.
8. Select the correct Compressor Preset (HDV 720p or HDV 1080i) and click OK.
9. In the Video section of the Movie Settings window, click Size.
10. In the Export Size Settings window select "Use custom size" and set the width to 1920 and the Height to 1080 and click OK.

11. In the Sound section of the Movie Settings window, click Settings.
12. From the **Format** pop-up menu, choose **Linear PCM**.
13. From the **Channels** pop-up menu, choose **Stereo (L R)**.
14. From the **Rate** pop-up menu, choose **48.000** kHz and click OK.

15. Click OK in the Movie Settings window.
16. Choose a location and name for your movie and click Save.

Mac OS X 10.4.3 or later: Sudden Motion Sensor information doesn‘t appear in System Profiler or third-party utilities

This article has been archived and is no longer updated by Apple.

If System Profiler, or third-party utilities capable of reporting the status of Sudden Motion Sensor, don't display any information for the Sudden Motion Sensor, it's not an indication of an issue. This omission can happen when using Mac OS X 10.4.3 or later on these PowerBook models:

- PowerBook G4 (12-inch 1.5 GHz)
- PowerBook G4 (15-inch 1.67 GHz)
- PowerBook G4 (17-inch 1.67 GHz)
- iBook G4 (Mid 2005)

The missing information is not a reflection upon the sensor's actual status, so your sensor is probably working fine despite the reporting issue.

This document will be updated as more information becomes available.

Published Date: Feb 19, 2012

About the Mac OS X 10.4.5 Update (combo)

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.5 Update (combo) updates Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, or 10.4.4 to version 10.4.5. (If you are just updating from Mac OS X 10.4.4 to 10.4.5, see this article instead.)

Important: Please read before installing.

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- If issues occur during installation--for example, Software Update quits unexpectedly, please see this article.

Installation

There are two ways to update to Mac OS X 10.4.5: Use Software Update or the standalone installer. You only need to use *one* of these methods to update your computer.

Automatic Software Update
Software Update, located in the **Apple** menu, will automatically download the latest Apple software. (Software Update might have linked you to this article to learn more about the update.) Note that the update's size may vary from computer to computer when installed using Software Update. Some updates must be installed prior to others, soyou may need to run Software Update more than once to get all of the available updates.

Standalone installer
Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. Two versions of the standalone installer are available from Apple Downloads: a delta and combo.

- The delta update installer (described in a different article) updates Mac OS X 10.4.4 to 10.4.5.
- The combo update installer (described here) updates Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, and 10.4.4 to 10.4.5.

Improvements

This update offers many improvements. For a list of some of them, see this article.

Published Date: Oct 11, 2016

iTunes: How to set the poster frame of movies

This article has been archived and is no longer updated by Apple.

A "poster frame" is a still image of a movie that appears as the movie's icon in the Videos playlist. The default poster frame is the first frame in the movie.

To change a movie's poster frame:

1. In iTunes, play the movie in a separate window (not in full screen or the main window).
2. Drag the playhead to the desired frame.
3. Right-click (or Control-click) the movie window, and from the shortcut menu, choose **Set Poster Frame**.

Note: You can only change the poster frame of videos you import. You can't set the poster frame of videos purchased from the iTunes Store, muxed (multiplexed) videos including MPEG-1 and MPEG-2 files, and 3GP videos.

iTunes 7 for Mac: Restore option is not available

This article has been archived and is no longer updated by Apple.

When you connect an iPod to a Mac with iTunes 7 or later, you may come across a situation in which the **Restore** button is dimmed (grayed out) and the iPod icon displayed is for the wrong iPod model as shown below.

This occurs when the **iPodDriver.kext** file doesn't load correctly, and it can happen with any iPod model that has a color display.

To resolve this issue, follow the steps in this article.

Published Date: Oct 11, 2016

Memory Card not Erased

This article has been archived and is no longer updated by Apple.

If you connect a camera directly to your computer and then use the Erase and Eject button to erase images after import, you may encounter situations in which not all the images are erased.

To avoid this issue, it's first and foremost recommended that you erase or format cards using the camera itself rather than Aperture, or your computer in general. In-camera deletion is superior, because some cameras use a more specialized format, while Aperture must use a generic format. Think of any computer-centric erasure method as a convenient backup method for card use that's not business critical, or when in-camera deletion is not possible.

Secondly, when deleting in camera, a **format** command is superior to an **erase all** (or similar) command. If you mix the use of your memory cards between different camera models, for example, the differing folder structures used by the cameras may result in situations in which an erase will not detect the file (thus leaving your card nearly full). However, a format will always erase the files in that scenario, and often a format is faster than an erase.

Third, a high-speed card reader (FireWire or USB 2.0) is generally a superior tool for importing images as compared to a direct camera connection. If you don't have a card reader and must import directly from camera, check your camera's settings to see if it allows you to specify the mode used by the camera when connecting to a computer. The two common modes are "peer to peer" (PTP) and "mass storage." Try setting your camera to the mass storage, or similarly named, mode.

Monitor Repair: Should I repair my own display?

I have three monitors. One will not power on, another is out of focus, and the last flashes blue. Can I open the monitor and turn some screws or replace a part?

I know how to use a soldering iron. As an avid computer user I have worked on my own computer equipment to install RAM and cards.
This article has been archived and is no longer updated by Apple.
Apple does not recommend you attempt to repair a display yourself unless you are an Apple Authorized Service Provider or a technician trained in display or monitor repair. A display has dangerously high voltage even when the display is off and unplugged.

Voltages inside a display can reach up to 30 000 V and can pose a serious shock and safety hazard when the display's case is open. Apple recommends you have a local Apple Authorized Service Provider service your display.

Aperture: Custom Sort order lost on imported/exported projects

This article has been archived and is no longer updated by Apple.

A "custom" sort allows you to manually arrange the order of images rather than going in filename or date order, for example. If you custom sort an Aperture project then export it, or when you import one that was previously exported, the custom sort order will not be retained.

This issue is resolved in Aperture 2.0.

Published Date: Oct 11, 2016

Aperture: Web galleries don‘t appear correctly in Internet Explorer for Macintosh

This article has been archived and is no longer updated by Apple.

If you create a web gallery in Aperture using the Picture theme, it may show blue boxes along the top of Detail pages when viewed in Internet Explorer for Macintosh.

Aperture does not support Internet Explorer for Macintosh. Web Galleries should display properly when viewed in Safari, FireFox, Netscape, Mozilla, or Internet Explorer for Windows.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Oct 11, 2016

Aperture: Grayscale TIFF thumbnails do not appear in the Import window

This article has been archived and is no longer updated by Apple.

You may notice that some of your grayscale images appear as blank gray thumbnails in the Import window, while others don't.

This issue affects 16-bit grayscale TIFF images. However, other grayscale images, such as a JPEG, may work as expected.

Aperture does not support 16-bit grayscale TIFF images at this time. As a workaround, try using another application to convert the grayscale image to RGB mode before importing to Aperture.

Aperture: Some image edges cut off when printing a book as a PDF file

This article has been archived and is no longer updated by Apple.

If you have full-bleed (flush to the edge) images in a book, and you try to print it as a PDF on a printer that does not support borderless printing, then some of your page edges may be cut off.

When printing a book with full-bleed content, be sure that your printer supports borderless printing.

Published Date: Oct 11, 2016

Aperture: Aliases do not appear in the Import window

This article has been archived and is no longer updated by Apple.

An alias won't appear in the Aperture Import window. If you want to import images from aliased folders, you need to navigate to the original folders.

Advanced method
Advanced users who are familiar with symlinks may use a symlink instead of an alias as a workaround. However, Apple will not provide technical support on this option. To learn more about symlinks, execute "man symlink" in the Terminal.

Published Date: Oct 11, 2016

Aperture: Image appears in book layout, but not in the book‘s Browser

This article has been archived and is no longer updated by Apple.

Sometimes an image may appear in a book layout, but not in the book's Browser.

This is the expected behavior if you add an image to a book, then later you return to the project and (without thinking about the book) stack the image in question with another image that is not in the book's set of images.

If the image in the book is not the pick of the stack to which you added it, the result is that neither the stack nor the book image appear in the book's Browser, but the image will still appear in the book's layout. If you make that image the pick of the stack, then the stack appears in the book's layout.

If you don't want to worry about this, just remember to avoid stacking images after they are placed in a book.

This issue is resolved in Aperture 2.x.

Published Date: Feb 20, 2012

GarageBand 3: Send Song to iTunes does not work in a certain situation

This article has been archived and is no longer updated by Apple.

If you use the forward slash character (/) in a GarageBand song name, then try using the **Send Song to iTunes** command, the song won't appear in iTunes. The mixdown progress bar appears to complete, but iTunes doesn't open.

To avoid the issue, avoid using the forward slash in song names.

Apple USB Modem disconnects after inserting audio CD

This article has been archived and is no longer updated by Apple.

With some computers that are running Mac OS X 10.4.3 or later, iTunes 6 or later, and that are using the Apple USB modem, you might find after you put an audio CD into your computer that the Internet Connect application says you have lost your connection to the Internet. Here are some steps you can take to avoid having this happen:

- Insert your audio CD before you connect the computer to the Internet.
- Once iTunes has opened, import the music from your audio CD that you have the right to copy to the computer by clicking the Import button in iTunes.
- Once your music has been imported, eject the audio CD.
- Now that the audio CD has been ejected, connect to the Internet. If you want to listen to your music now, you can play your imported music right through iTunes.

A note about copyright

iTunes software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material, you should contact your legal advisor. See the iTunes Store Terms of Service for additional information.

Xsan 1.0 to 1.2: For maximum stability, manually configure LUNs larger than 2TB

This article has been archived and is no longer updated by Apple.

To ensure maximum stability, you should manually label LUNs greater than 2TB when using Xsan versions 1.0 to 1.2 only (Xsan 1.3 and later running on Mac OS X 10.4.5 or later will support LUNs of 2TB and larger).

When you introduce a LUN that's larger than 2TB to an Xsan volume, Xsan Admin reduces the size, or "Sector count," of the LUN to 2TB worth of sectors. Xsan Admin accomplishes this reduction during the naming, or "labeling," of LUNs in **Xsan Admin > Setup > LUNs**. Instead of using Xsan Admin to label these larger LUNs, you can use the instructions in this article to manually configure the LUNs via the Terminal&emdash;this is the preferred method in Xsan 1.2 and earlier, because it allows you to specify a custom sector count size, 4294965247, which is a slightly smaller amount of sectors than the Xsan Admin application configures. The slightly smaller sector count is recommended for LUNS which will be added to new Xsan volumes or for LUNs that are to be added to pre-existing volumes. Labeling LUNs in this manner avoids certain scenarios that result in instability.

WARNING: These steps can only be performed on LUNs which are not already part of an Xsan volume. Performing these steps on LUNs that are currently included in an Xsan volume will cause all data to be lost on the Xsan Volume. Additionally, these steps will erase any data currently stored on the LUN. Therefore, you must back up all data on the LUN before proceeding.

Preparing the LUN(s)

In the Terminal application, issue the following command to Identify the LUN(s) that you wish to configure:

```
$ sudo cvlabel -l
```

Example results:

```
/dev/rdisk3 [APPLE Xserve RAID 1.26] unknown Sectors: 4724464025. SectorSize: 512. /dev/rdisk5 [APPLE Xserve RAID 1.26] acfs "Big_RAID5-2" Sectors: 4724464025. SectorSize: 512. Maximum sectors: 4724464025.
```

This output indicates that there are two available LUNs, `/dev/rdisk3` and `/dev/rdisk5`. Note by the sector count of 4724464025 that both LUNs are larger than 2TB (this is more than 2TB's worth of sectors). `/dev/rdisk3` is designated as "unknown" and therefore has not been configured for use with Xsan, while `/dev/rdisk5` has been configured for use with Xsan and labeled "Big_RAID5-2." To reconfigure a LUN which is already configured for use with Xsan, issue the following command in the Terminal:

```
$ sudo cvlabel -u <DeviceName>
```

Where `<DeviceName>` is the name of the volume to be unlabeled. For example, to unlabel `/dev/rdisk5` in our example, you would issue this command:

```
$ sudo cvlabel -u Big_RAID5-2
```

Before we proceed with configuring the LUNs with new labels, we'll verify that both LUNs have been unlabeled:

```
$ sudo cvlabel -l
```

Example results:

```
/dev/rdisk3 [APPLE   Xserve RAID     1.26] unknown  Sectors: 4724464025.
SectorSize: 512. /dev/rdisk5 [APPLE   Xserve RAID     1.26] unknown  Sectors:
4724464025. SectorSize: 512.
```

Both LUNs have been unlabeled, as they both are designated as "unknown."

Creating a label file

Issue the following command in the Terminal to create a temporary file containing the configuration information for the LUN:

```
$ cat > /tmp/lun-label-info
```

This command creates a temporary file in the `/tmp` directory which you will edit by entering text in this format:

<LUNname> /dev/<rdiskNumber> 4294965247

For example, you might type:

```
HugeLUN1 /dev/rdisk3 4294965247
HugeLUN2 /dev/rdisk5 4294965247
```

When you finish typing in the data, press Control-D on the keyboard.

Labeling the LUN(s)

Issue the following command in the Terminal to configure the LUN:

```
$ sudo cvlabel /tmp/lun-label-info
```

Example output:

```
*WARNING* This program will over-write volume labels on the
devices specified in the file "/tmp/lun-label-info". After execution, the
devices will only be usable by the Xsan. You will have to re-partition the
devices to use them on a different file system.Do you want to proceed? (Y / N)
-> y

/dev/rdisk3 [APPLE Xserve RAID 1.26] unknown Controller '5000393000001723', Serial '500039300000 1723L1',
Sector Size 512, Sectors Max 4724464025 (2.2TB)

Do you want to label it acfs-VTOC - Name: HugeLUN1 Sectors: 980416512 (Y / N)
-> y
New Volume Label -Device: /dev/rdisk3  acfs Label: HugeLUN1  Sectors: 4294965247.

/dev/rdisk5 [APPLE Xserve RAID 1.26] unknown Controller '5000393000001724', Serial '500039300000 1723L0',
Sector Size 512, Sectors Max 4724464025 (2.2TB)

Do you want to label it acfs-VTOC - Name: HugeLUN2 Sectors: 980416512 (Y / N)
-> y
New Volume Label -Device: /dev/rdisk5  acfs Label: HugeLUN2  Sectors:
4294965247.Done.  2 source lines.  2 labels.
```

Intel-based Mac: How to tell if an application is Universal

This article has been archived and is no longer updated by Apple.

Are you wondering whether your application is running with Rosetta or not? Its easy to figure out if you have a Universal version of an application. Here's how:

1. In the Finder, click once on the application icon, so it's highlighted.
2. From the **File** menu, choose **Get Info**.
3. Find the section labelled **General** and toggle the triangle, if necessary, to open this section.
4. On the **Kind** line, Universal applications appear as "Application (Universal)", like in the example below.

If your application is Universal but you want it to run with Rosetta, note that there is a checkbox that says "Open using Rosetta". This can be useful if your Universal application uses plugins that have not yet been released in a Universal format.

Mac OS X 10.4 (Danish): Grapher Help content missing

This article has been archived and is no longer updated by Apple.

If you can't see Mac Help information for Grapher in the Danish language version of Mac OS X 10.4 Tiger, there's an easy workaround. For example, in Help Viewer, clicking "Læs om Grapher" (Learn about Grapher) or "Se alle emner" (See all topics) results in an blank page with a non-functional search box.

Workaround

1. Open Grapher.
2. Choose **Grapher Help** from the **Help** menu.
3. From the **Library** menu, choose **Hjaelp till Grafplotter**.

You should now see Help content for Grapher.

This document will be updated as more information becomes available.

Intel-based Mac: Learn about device drivers

This article has been archived and is no longer updated by Apple.

The Intel-based Macs make the transition from PowerPC hardware to Intel hardware as seamless as possible. There are some undeniable differences in the hardware, though, so you might find that your printer or other accessory worked fine on your older Mac but suddenly isn't working on your new Intel-based Mac. If that's the case, you want to check your device drivers.

Some background info:
In Mac OS X, drivers for some printers and other devices are implemented via kernel extensions. These drivers, in the form of kernel extensions, are generally supplied by the manufacturer of the device. Some generic device drivers are included with Mac OS X, but most manufacturers make their own drivers in order to customize the features available through their product.

Kernel extensions are installed in /System/Library/Extensions. Kernel extensions must be in a Universal format to work on an Intel-based Mac. If you're troubleshooting your accessory and aren't sure that its related driver is Universal, follow these steps:

1. From the Finder, click on your hard drive to go to the top level of the file structure.
2. From there, double-click the **System** folder to open it.
3. From there, double-click the **Library** folder to open it.
4. From there, double-click the **Extensions** folder to open it.
5. Locate the kernel extension for your product and click on it once, to highlight it.
6. From the **File** menu, choose **Get Info**.
7. Find the section labelled **General** and toggle the triangle, if necessary, to open this section.
8. On the **Kind** line, Universal drivers appear as "Kernel Extension (Universal)", like in the example below. If you find that the kernel extension is not Universal, go to the manufacturer's web site and see if you can locate a Universal driver.

QuickTime for Windows: How to Uninstall on Windows 95

This article tells how to uninstall QuickTime for Windows on a computer running Windows 95.
This article has been archived and is no longer updated by Apple.
Here are the steps for uninstalling QuickTime for Windows when using Windows 95.

1) Open the Control Panels window.

2) Open the Add/Remove Programs window. Bring the Control Panel window to the front and close it.

3) Under the Install/Uninstall tab of the Add/Remove Programs window, select QuickTime for Windows (16-Bit) or QuickTime for Windows (8-Bit). They can both be removed, but you must remove them one at a time.

4) The QuickTime Uninstall window will open. Click on the Add/Remove button. The item will be removed. Repeat for the other version of QuickTime if necessary.

If you see a message window which states "Delete all QuickTime cannot be uninstalled at this time because one of the installation files is in memory. Restart Windows and try again."

This means you have not closed the Control Panel window, and the system thinks QuickTime is in use. Close the Control Panel window and you will be able to remove the item.

Logic Pro/Express 7.2: Items dimmed in Sample Edit menus

This article has been archived and is no longer updated by Apple.

Sometimes destructive edits are not possible in the Sample Edit window, which you know is the case when items in the Functions and Factory menus are dimmed.

This occurs when you are working with audio files for which you have read-only access. This might happen, for example, if you save a project to a network volume and then try to edit audio. It can also happen when the opened audio file is written in a compressed file format, such as AAC (".m4p"). In versions of Logic prior to 7.2, you would have access to the menu items, but an alert message indicating lack of write access would appear.

Logic Pro/Express 7.2: Some instruments install to the wrong location

This article has been archived and is no longer updated by Apple.

When you specify a custom install location for Garageband Content in the Logic 7.2 Installer, two of the instruments are placed at the default location rather than your custom location. These two instruments (Mixed Choir and Vibraphone) appear in a separate folder labeled "GarageBand" when you select an instrument from a channel strip.

To resolve the issue, you can manually move the two instrument files from the default location of `/Library/Application Support/GarageBand/Instrument Library/Sampler/Sampler Instruments/` to your custom location.

This document will be updated as more information becomes available.

GarageBand 3: Podcast export fails without warning when using Mac OS X 10.3.9

This article has been archived and is no longer updated by Apple.

Under a certain set of circumstances, GarageBand appears to export your podcast, showing progress dialogs for chapter creation and mixdown, but the file is not actually created.

This happens only under a very specific set of circumstances, and all of these conditions are required for this issue to occur:

- Working on a system with Mac OS X 10.3.9
- Exporting a podcasts that is 10 minutes or longer
- Audio Podcast Setting of either Musical Podcast or Higher Quality

To avoid the issue, update to GarageBand 3.0.2 or later.

Apple Hardware Test incorrectly reports VRAM on iMac (Early 2006)

This article has been archived and is no longer updated by Apple.

Apple Hardware Test is provided on a disc with every Mac and can be used to test hardware in a standalone environment.

The 3A100 version of Apple Hardware Test that shipped with iMac (early 2006) computers incorrectly reports the amount of VRAM (video random-access memory) installed in your computer.

The most accurate way to determine the amount of VRAM installed in your computer is to restart the computer in Mac OS X and follow these steps:

1. From the **Apple** menu, select **About this Mac**.
2. Click the **More Info** button, which will open System Profiler.
3. In the left-hand column, click on the line titled **Graphics/Displays** under the **Hardware** heading.
4. In the window to the right, details of your video card will appear. One of the lines says "VRAM (Total):"—the amount of Video memory appears on this line.

Mac OS X Server: Improving MySQL Performance

This article has been archived and is no longer updated by Apple.

On versions before 10.4.7, the default configuration of MySQL on Mac OS X Server reduced the memory footprint of the database service at the cost of server performance. With version 10.4.7 and later, MySQL on Mac OS X Server creates a my.cnf file from an included configuration file which significantly increases performance at the cost of increased memory usage. (Note: an existing version of the my.cnf file will not be destroyed by the upgrade, but it will not be upgraded either.)

For sites running older versions of Mac OS X Server, MySQL performance may be increased by following the steps below, according to the amount of RAM in the server.

To improve MySQL performance, follow the steps below, according to the amount of RAM in the server.

Systems with up to 1 GB of RAM

1. Run this command:

   ```
   sudo cp /usr/share/mysql/my-large.cnf /etc/my.cnf
   ```

2. Open the the configuration file in your preferred text editor. In the file locate the section labeled [mysqld]. Add the following at the end of section:

   ```
   skip-thread-priority
   ```

3. Start (or restart) MySQL.

Systems with more than 1 GB of RAM

1. Run this command:

   ```
   sudo cp /usr/share/mysql/my-huge.cnf /etc/my.cnf
   ```

2. Open the the configuration file in your preferred text editor. In the file locate the section labeled [mysqld]. Add the following at the end of section:

   ```
   skip-thread-priority
   ```

3. Start (or restart) MySQL.

For sites with an existing my.cnf file, Apple recommends the administrator compare their current settings with those documented in one of the above existing sample configuration files and update as necessary.

Which version of Backup to use when restoring files

This article has been archived and is no longer updated by Apple.

Whenever you restore backed up files, always use the same version of Backup (or later) that was used to create the backup.

For example, if you created a backup using Backup 3.1, do not try to restore backed up files using Backup 3.0.1.

If, on the other hand, you created a backup using Backup 3.0.1, you can use any version from 3.0.1 or later to restore the files.

It is recommend that you always update to the latest version of Backup before you attempt to restore a backup.

Character Palette Font Variations in menu text

This article has been archived and is no longer updated by Apple.

In Mac OS X, you can use the Character Palette to type special characters and symbols. You can use the Character Palette in DVD Studio Pro with text objects in a menu (Open the Character Palette by choosing Special Characters from the Edit menu).

Symptom

If you choose a Font Variation for a special character, the character won't appear with the default text color (set in Preferences). Additionally, if you insert a special character Font Variation in a text object or button text by dragging and dropping (as opposed to double-clicking the character or clicking Insert), the DVD Studio Pro project can't opened once it is saved and closed.

Solution

To use special characters from the Character Palette, follow these steps after adding a text object or selecting button text on your DVD menu or in Property Inspector text entry fields:

1. Click so the text entry cursor is active (cursor blinking or existing text selected) in the text object or button text on the menu or in the Property Inspector window.
2. Choose **Edit** > **Special Characters**.
3. From the **View** pop-up menu at the top of the Character Palette, choose the type of characters you want to see.

4. Click an item in the list on the left to see the characters that are available in each category.
5. Select the character or symbol in the right column that you want to insert into your document, and then click Insert.

Do not select a font variation from the Font Variation section of the Character Palette.

Mac OS X Server 10.4 or later: Use only lower case domain names for iChat service

This article has been archived and is no longer updated by Apple.

When you configure the iChat service in Server Admin, be sure the domains in the Host Domains field contain only lower case letters. If there are any upper case letters, the iChat service may not start.

If the iChat service will not start and any iChat host domains contain one or more upper case letters, follow these steps:

1. Launch Server Admin.
2. Select the appropriate server under Computers & Services.
3. Select the iChat service.
4. Click the Settings tab.
5. Change any upper case letters in the Host Domains field to lower case letters.
6. Click the Save button.
7. Click the Start Service button to start the iChat service.

For more information about configuring the iChat service, select "Mac OS X Server Help" in Server Admin's Help menu or refer to the Collaboration Services Administration guide available from the server documentation page.

iDVD 6: Themes pane is blank after upgrading

This article has been archived and is no longer updated by Apple.

Learn what to do if the Themes pane is blank after upgrading to iDVD 6.

Solution

To resolve this issue:

1. Go to /Library/Receipts/ and drag iDVDThemes.pkg to the Trash.
2. Empty the Trash.
3. Insert the iLife ’06 DVD and launch the iLife ’06 installer to custom install iDVD 6.
4. Click Continue until Select a Destination screen.
5. Chose your destination volume, click Continue.
6. Click Customize.
7. Uncheck all options except Registration, iDVD, and iDVD Themes (you may have to click the triangle next to iDVD to see the iDVD Themes option).
8. Click the Upgrade button and enter Administrator password when prompted.
9. When prompted to register, click Later.
10. Click Close when done.
11. Verify that the iDVD themes were successfully installed.
12. If the themes are installed, run Software Update to ensure you have the most recent version of iDVD.

Setting up a modem for faxing in Mac OS X 10.4

This article has been archived and is no longer updated by Apple.

To make your internal Apple modem or external Apple USB modem available for faxing, just send a fax from any application.

You can follow these simple steps:

1. If you're setting up an external Apple USB modem, make sure that it is directly connected to your Mac.
2. Open any document.
3. Choose **Print** from the **File** menu.
4. Select "Fax PDF" from the PDF pop-up menu.
5. Verify that the expected modem is selected in the Modem pop-up menu, such as "External Modem" for the Apple USB modem.

If you want to receive faxes, set up your Mac to receive faxes. The modem will answer calls (if the computer is turn on and awake) even if the modem does not appear in the Fax List.

If you are using a third-party modem, contact the manufacturer for assistance if these steps do not help.

Aperture 1.0: Too Much Space Between Shots on Contact Prints

This article has been archived and is no longer updated by Apple.

Note: Update to Aperture 1.1 or later to resolve this issue.

When using certain printers, contact sheets will have large spacing between shots. This happens because the affected printers are using their margin size between shots. You can easily avoid this issue by creating a custom paper size with adjusted margins.

1. Quit Aperture.
2. Open any other application that supports printing, such as TextEdit.
3. Choose **File > Page Setup**.
4. From the **Paper Size** pop-up menu, choose **Manage Custom Sizes...** .
5. Click the plus button (+) to add a new paper size. It will be called "untitled," but you can click on the name to rename it whatever you like.
6. Be sure that your new size is still selected after renaming it, and then enter the height and width of the paper that you will print contact sheets on.
7. Set each of the four margin values to 0, or to a smaller value than it is currently if you would like to keep some space between the shots.
8. Click OK.
9. Click OK again.
10. Open Aperture.
11. In the Aperture Print Preset window, create a new Contact Sheet preset, and set the Paper Size to the new custom size.

This document will be updated as more information becomes available.

About Apple Remote Desktop 3.0

This article has been archived and is no longer updated by Apple.

Apple Remote Desktop (ARD) 3.0 can be installed on computers that have:

- Mac OS X 10.3.9 or later, including Intel-based Macs with Mac OS X 10.4.4 or later.
- An Ethernet (recommended), Airport, or FireWire over IP network connection

Apple Remote Desktop 3.0 is a Universal Binary application, which means it can run on both PowerPC-based Macs and Intel-based Macs.

Compatibility with previous versions of Apple Remote Desktop

Apple Remote Desktop 3 allows you to add Apple Remote Desktop version 2.x clients to your computer lists and will automatically assist you in upgrading them to the current version of the client software.

If you choose not to upgrade your clients to the current version, you will have limited backwards compatibility and will only be able to control/observe computers that are running version 2.x of the client software.

Enabling Apple Remote Desktop nn Mac OS X 10.3.9 or later client computers

In Sharing preferences, click the Apple Remote Desktop service, then click Start.

Late Breaking News

See the following articles for more information about installing and using Apple Remote Desktop 3:

- Apple Remote Desktop 3: ARD 2.2 clients may hang during upgrade when running Mac OS X 10.3.8 or earlier
-
- Apple Remote Desktop 3: Your task server, "", could not be contacted
- Apple Remote Desktop 3: Apple Remote Desktop 3: First launch dialog causes a "Copy and Open" or Open Items task to fail

For more support information, visit the Apple Remote Desktop support page.

iWeb: Slow image loading in web browsers

This article has been archived and is no longer updated by Apple.

In iWeb 1.0, when you added images to your page they would be converted to PNG format images when published. PNG is a format which allows for image transparency to be displayed in your web browser. However, the downside is that this image format takes up more disk space than a compressed JPEG.

Enhancements in iWeb 1.0.1 allow for most types of images and photo page thumbnails to be published as JPEGs where possible. This translates into faster page loads when people visit your website.

To take advantage of this change in an existing iWeb 1.0 site you'll need to republish all of your pages. To do that, hold down the Option key and from the **File** menu, choose **Publish All to .Mac**.

About the security content of the Mac OS X 10.4.5 update

This article has been archived and is no longer updated by Apple.

This document describes the security content of the Mac OS X 10.4.5 update, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Mac OS X 10.4.5 Update

- **Kernel**

  CVE-ID: CVE-2006-0382

  Available for: Mac OS X 10.4 through 10.4.4, Mac OS X Server 10.4 through 10.4.4

  Impact: A malicious local user can cause a system crash

  Description: A malicious local user may trigger a system crash by invoking an undocumented system call. This update addresses the issue by removing the system call from the kernel. Credit to David Goldsmith of Matasano for reporting this issue.

Mac OS X 10.4: About printing Mail messages, wrapping text, and font sizing

This article has been archived and is no longer updated by Apple.

The application Mail that's included with Mac OS X 10.4 Tiger allows you to print emails in three different ways.

To find these three choices, choose Print from the File menu, then change the third pop-up menu's choice from "Copies & Pages" to "Mail". Whichever option you select will remain in effect for future printouts from Mail, until you change it again.

Tip: For any option, use the Preview button before printing to get an idea of how much paper will be needed, as well as how the printout will look.

Scale message to fit

With this option selected, Mail will not rewrap the text of the message on the printed page.

The printed document will look like how the message is displayed on screen. If the message window is wider than the paper width, then the message, including any text or graphics, will be reduced in size to fit the width of the paper. Any specified font size settings will be ignored.

Changing the width of a message window can cause the lines of text to rewrap—widening the window will create longer lines of text.

In many cases, the size of the text will be smaller than expected.

As when printing from TextEdit, the printout may not automatically be reduced to fit onto one piece of paper.

Rewrap message to fit

Mail strictly maintains the specified font size of the message with this option. This means that the text of the message will likely wrap differently on the printout, so that the width of the printout doesn't exceed one page. The printed document won't look exactly like it does on the screen. Also, because points per inch on a display is not the same as on paper, the printout may appear smaller than expected. Increase the font size before printing if desired, or use the "Keep the same apparent font size" choice.

Because printed text may wrap differently, this choice may not be best for printing structured text, such as a web page's HTML code, or an indented or nested list.

Keep the same apparent font size

If you're not sure which option might be best for you, try this one first. Mail will print the message using a font size that considers the difference between the number of points per inch on a display and on paper. The message may be rewrapped so that it's no wider than one page, but if you hold the piece of paper next to the display, the fonts should appear to be the same size (even if some words are on a different line).

Aperture: Book order still in progress when quitting, after earlier indication of completion

This article has been archived and is no longer updated by Apple.

If a book order appears to have finished uploading, and you try to quit Aperture, you may sometimes see a message that says the order is still in progress.

When you place the order, a progress bar says "Exporting Book... ." That actually represents the status of creation of the PDF file that will be uploaded to Apple Print Services, not the status of the upload itself. While the upload is in progress, you see this background task indicator in the control bar:

If you try to quit Aperture while the upload is in progress, you see this message:

> **Please Wait**
> You cannot quit the application until you have been notified that the current order is complete.

To see the status of the upload, choose **Window > Show Task List...** . Don't be concerned if it says 0% for a long time—your order is actually uploading. When the task list indicates that the file is completely uploaded, you can safely quit Aperture.

Note: The progress indicator shown above, as well as the task list entry for the book order, will only appear in Aperture 1.0.1 or later.

Logic Pro/Express 7: Logic Control input devices stop working when switching between Logic versions

This article has been archived and is no longer updated by Apple.

If you have both Logic 7.1 and Logic 7.2 installed on the same computer, then Logic Control and Logic Control XT control surfaces may stop functioning properly (knobs and sliders have no effect).

To resolve the issue, power down the control surfaces, power them back up, and then choose **Logic Pro & ; Preferences > Control Surfaces > Rebuild Defaults**.

Important: This solution will delete any user-created control assignments.

Logic Pro/Express quits when launched on an Intel-based Mac

This article has been archived and is no longer updated by Apple.

Logic Pro or Logic Express version 7.2 may unexpectedly quit during launch on an Intel-based Macintosh.

This happens if the control surface preference file located at `~/Library/Preferences/Logic/com.apple.logic.pro.cs` (Logic Pro) or `~/Library/Preferences/Logic/com.apple.logic.express.cs` (Logic Express) is copied from a PowerPC-based Mac to an Intel-based Mac.

To resolve the issue, delete the file and then launch Logic.

Mac OS X, Mac OS X Server: How to mount a volume as read-only

This article has been archived and is no longer updated by Apple.

In some cases a volume will fail to mount even though it is a valid volume. If you are unable to repair the volume with Disk Utility, you should try to mount it (make it available) as read-only in order to recover data from it. To mount a volume as read-only, follow these steps.

1. Open Terminal (/Applications/Utilities/Terminal) and execute this command: `diskutil list`
2. Find the name of the volume that doesn't mount in the output, such as this:

```
/dev/disk0
#: type name size identifier
0: Apple_partition_scheme *152.7 GB disk0
1: Apple_partition_map 31.5 KB disk0s1
2: Apple_HFS Drive160 152.5 GB disk0s3

/dev/disk1
#: type name size identifier
0: Apple_partition_scheme *76.7 GB disk1
1: Apple_partition_map 31.5 KB disk1s1
2: Apple_Boot 128.0 MB disk1s2
3: Apple_HFSX Drive80 76.6 GB disk1s3
```

   In this example, we'll use the volume "Drive80". Drive80 exists on disk1 on slice 3 in the above output, so the full device name is /dev/disk1s3.

3. Make a directory with the name of the drive in /Volumes by executing this command in Terminal: `mkdir /Volumes/Drive80` You'll want to substitute the name of your hard drive for "Drive80".

4. Mount the device as read-only by issuing the following command in Terminal: `sudo mount -t hfs -o rdonly /dev/disk1s3 /Volumes/Drive80` Again, substitute the name of your hard drive for "Drive80".
5. If the volume doesn't appear in the Finder, execute this command in Terminal: `disktool -r`.

If these steps are successful, it may be possible to retrieve or back up data from the volume. When all possible data is recovered the drive should be erased.

Video created with third-party software plays incorrectly on iPod

This article has been archived and is no longer updated by Apple.

Video created with (or converted with) some third-party applications may play incorrectly on Fifth Generation iPod after updating to version 1.1 of iPod Software.

Specifically, videos that played fine in version 1.0 of iPod software may stall and continue to play without audio.

Update iPod using iPod Software 1.1.1 or later.

See "Verifying iTunes video conversion and iPod video syncing using sample QuickTime files" for information on converting video using iTunes.

iWeb: Do not place objects over navigation menu

This article has been archived and is no longer updated by Apple.

If you cover any hyperlinks on your web page with an image, shape, or text box, the links will not work when the site is published (for instance, the page links in your navigation menu). This is true even if the image area covering the link is transparent.

To avoid this issue, do not cover the navigation menu (or hyperlinks you create) with objects when you are designing your site.

This document will be updated as more information becomes available.

Published Date: Feb 19, 2012

iWeb: Some placeholder images cannot be used for movies or audio files

This article has been archived and is no longer updated by Apple.

You can replace some placeholder images with photos, movies or audio files. When you drag a movie or audio file from the Media Browser to one of these universal placeholders, you will see a green "plus" icon before you release the mouse.

However, there are placeholder images in some templates that you can't replace with video or audio (if you try, you'll see the file link arrow shown below).

You can replace these placeholders with photos. You can also delete the placeholder image and then drag a movie or audio file to the canvas.

Mac OS X Mail: "The mail could not be sent, but is saved in your Outbox until it can be sent" alert

This article has been archived and is no longer updated by Apple.

In all versions of Mac OS X, Mail automatically works with some mail servers to verify the validity of your email message's recipients. It does this if the mail server has been configured to perform verification. If the server identifies any recipient's address as invalid or unrecognized, this alert will appear, along with an identification of which addressee is not recognized:

> "The mail could not be sent, but is saved in your Outbox until it can be sent."

If this happens, edit the message that's in the Mail outbox: Remove invalid recipients, then try to send the message again.

Logic: Defining custom bank messages

This article has been archived and is no longer updated by Apple.

Logic offers several preset bank select message formats, but in some cases you will need to define a custom message format to change banks on a particular synthesizer. Most synthesizers use a combination of Control 0 (Bank MSB) and Control 32 (Bank LSB) events to trigger bank changes. MSB and LSB stand for "most significant byte" and "least significant byte," respectively. Consult the MIDI implementation chart for your synthesizer to determine the particular combination it requires for bank changes.

Here's how to set Logic up to send custom bank messages:

1. In the Environment, select the Multi Instrument for the synthesizer for which you would like to define custom bank messages.
2. From the local **Options** menu, choose **Define Custom Bank Messages**.
3. A Bank Select Event List will open, with an MSB message for 16 banks already defined. This event list is similar to the normal MIDI edit event list, with one difference: Under the Position column is a bank number instead of the usual timeline position.
4. While holding the Command key, click the green CC Message button at the left to add a controller event. A new CC7 message will be added to the top of the list.

5. To change the CC7 message to a CC32 message, click "7" in the Number column and select 32 (bank LSB) from the pop-up menu that appears. Change the value to whatever your synthesizer requires to call up the specified bank. If necessary, adjust the Control 0 Bank MSB event's value.

6. If your synthesizer requires that the Control 0 and Control 32 messages be received in a particular order, you may specify the order by changing the letter in parentheses to the right of the bank number. Earlier letters will be sent before later letters.
7. Continue to add and edit events until you have defined the messages needed to call up each bank on your synthesizer.

Final Cut Pro: Avoid creating multiclips that contain both drop frame and non-drop frame clips

This article has been archived and is no longer updated by Apple.

NTSC video is recorded with either **drop frame** or **non-drop frame** timecode. The differences between these two timecode methods are detailed in the Final Cut Pro User Manual (available under the Final Cut Pro Help menu).

You should avoid making multiclips which contain both drop frame timecode clips and non-drop frame timecode clips. You may encounter unexpected results if you use multiclips which contain source clips of both timecode methods.

While shooting, set all cameras and decks to record the same way — all using drop frame or all using non-drop frame. If you need to make multiclips from clips which were recorded using both drop frame and non-drop frame timecode, you should choose **Modify** > **Timecode** to change clips as necessary so that all the clips which constitute any given multiclip all use the same timecode method.

Logic Pro 7.2: "Critical error occurred while registering with Stream Manager"

This article has been archived and is no longer updated by Apple.

When launching Logic Pro 7.2 with TDM and DTDM, you may see this message:

> "Critical error occurred while registering with Stream Manager the ESB will not work properly - please check your stream manager installation."

Followed by this message:

> "Direct TDM: ESB plugin not found (-10800)"

This happens if Logic Pro 7.2 is installed before Pro Tools 7. To avoid this issue, install Pro Tools first (minimum requirement 7.1 cs4), and then Logic Pro 7.2 If you have already installed Logic Pro, remove the Logic Pro application and then reinstall it after installing Pro Tools. It's also a good idea to remove the ESB TDM OSX and EXS24 TDM OSX plug-ins from `/Library/Application Support/Digidesign/Plugins` before reinstalling Logic Pro.

DVD Studio Pro 4: "Formatting failed" and "Muxer Bit Rate too high" error with H.264 for HD DVD

This article has been archived and is no longer updated by Apple.

DVD Studio Pro 4 allows you to author DVDs with high definition (HD) video that conform to the HD DVD standard. There are two H.264 presets in Compressor 2 for encoding video for an HD DVD project.

Symptom

If you customize one of these presets by increasing the bit rate of the H.264 stream, you may get a "Formatting failed" error and the log would list "Muxer Bit Rate Too High" when you build your project in DVD Studio Pro. This can occur when you set the bit rate higher than the preset bit rate.

Solution

Either lower the bit rate in your custom Compressor preset, or turn off frame controls.

You can adjust the bit rate with the Bit Rate slider in the Encoder pane of the Compressor Inspector window.

You can turn off frame controls in the Frame Controls pane of the Compressor Inspector window.

Note: This issue will not occur if you use either of the presets (HD DVD H.264 60 minutes or HD DVD H.264 90 minutes) in the default configuration.

This document will be updated as more information becomes available.

Using AOL dial-up service with an Intel-based Mac

This article has been archived and is no longer updated by Apple.

If you use the Apple USB Modem with your Intel-based iMac or MacBook Pro to connect to America Online, you need to change from the default internal modem setting to an external modem setting. Before you do this, the AOL connection software may not recognize your modem.

1. Quit the AOL software, if it is open.
2. Be sure the Apple USB Modem is connected to a USB port on your computer.
3. From the **Apple** menu, choose **Location > Network Preferences...** .
4. From the **Show** pop-up menu, choose **External Modem**.
5. Click the Modem tab.
6. From the **Modem** pop-up menu, choose **Apple External 56K Modem (v.92)**.
7. Click the **Apply Now** button.
8. Quit System Preferences.

The AOL software should now recognize your modem.

iDVD 6: Undo after previewing can cause iDVD to unexpectedly quit

This article has been archived and is no longer updated by Apple.

You can create an autoplay movie or slideshow, which is one that plays automatically when you insert it into a DVD player (it starts playing before the main menu appears).

If you create an autoplay movie or slideshow in iDVD and then preview the project, iDVD can unexpectedly quit after you close the preview window and return to the project. This occurs when you choose **Undo** from the **Edit** menu.

To resolve this issue, update to iDVD 6.0.4 or later.

Published Date: Feb 20, 2012

Front Row: "Movie trailer server is not responding" alert

This article has been archived and is no longer updated by Apple.

When you try to view movie trailers in Front Row on any Front Row-equipped computer (such as iMac G5 (iSight), iMac (Early 2006), MacBook, MacBook Pro, etc.), you may see the alert "The movie trailer server is not responding" instead of the list of trailers.

If this happens, you need to update Front Row to version 1.2.2 or later. To do this, run Software Update and install any available updates. (If you want to find out what version of Front Row you are using, find Front Row in your computer's Applications folder, highlight it, and choose Get Info from the File menu. This, however, isn't necessary for the update process.)

Published Date: Feb 20, 2012

iDVD 6: Background movie displays as still image

This article has been archived and is no longer updated by Apple.

When you open an iDVD 5 project in iDVD 6.0, background movies may display as a still image in your menu instead of showing full motion video. This happens if you have background movies in any of your menus. The audio from your background movie will still play normally.

To resolve this issue, update to iDVD 6.0.4 or later.

Published Date: Feb 20, 2012

Soundtrack Pro projects play back at incorrect sample rate with Digidesign 002

This article has been archived and is no longer updated by Apple.

Symptom

Soundtrack Pro projects set to sample rates other than 44.1 kHz (including 32, 48, 88.2, and 96 kHz) play back at 44.1 kHz through a Digidesign 002 audio interface.

Solution

This issue occurs if the Digidesign Core Audio Manager application does not automatically launch when Soundtrack Pro is launched. As a workaround, manually launch the Digidesign Core Audio Manager prior to launching Soundtrack Pro. Update to Mac OS X 10.4.4 or later to resolve this.

Mac mini (Early 2006): About the IR Sensor

This article has been archived and is no longer updated by Apple.

The Mac mini (Early 2006) can be used with the Apple Remote to activate features like Front Row.

The IR Sensor is located to the right of the slot-loading optical drive:

1. Slot-loading optical drive
2. Built-in infrared (IR) receiver
3. Power indicator light

For best results when you use the Apple Remote with your Mac mini (Early 2006), make sure of the following:

- You have an unobstructed line-of-sight view to the front of the computer (as shown above).
- You are using the remote within 30 feet of the computer.
- You are pointing the lens end of the Apple Remote directly at the front of the computer.

Published Date: Oct 7, 2016

Mac Mini (Early 2006): Memory Specifications and Upgrades

This article has been archived and is no longer updated by Apple.

This article provides the memory specification and expansion capability for the Mac Mini (Early 2006) computer.

The Mac Mini (Early 2006) has two internal SO-DIMM RAM slots. The computer ships from the factory with at least 512 MB of DDR2 SDRAM; one 256 MB SO-DIMM in each slot. (It may come with more RAM installed, depending on how you ordered the computer from Apple—two 512 MB SO-DIMMs for 1GB total, or two 1GB SO-DIMMs for 2GB total).

The maximum amount of SDRAM supported by the Mac mini (Early 2006) is 2GB (one 1GB SO-DIMM in each slot) with the following specifications:

- PC2-5300
- unbuffered
- nonparity
- 200-pin
- 667 MHz DDR2 SDRAM

DIMMs with the following features are not supported by the Mac mini (Early 2006):

- registers or buffers
- PLLs
- ECC
- parity
- EDO RAM

Additional memory should be installed by an Apple Retail Store or Apple Authorized Service Provider. For optimum performance, it is recommended to use two SO-DIMMs (one in each slot) of the same DIMM size (e.g. two 512 MB SO-DIMMs).

About Security Update 2006-001

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2006-001, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2006-001

- **apache_mod_php**

  CVE-ID: CVE-2005-3319, CVE-2005-3353, CVE-2005-3391, CVE-2005-3392

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Multiple security issues in PHP 4.4

  Description: PHP 4.4.1 fixes several security issues in the Apache module and scripting environment. Details of the fixes are available via the PHP web site (www.php.net). PHP ships with Mac OS X but is disabled by default.

- **automount**

  CVE-ID: CVE-2006-0384

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Malicious network servers may cause a denial of service or arbitrary code execution

  Description: File servers on the local network may be able to cause Mac OS X systems to mount file systems with reserved names. This could cause the systems to become unresponsive, or possibly allow arbitrary code delivered from the file servers to run on the target system.

- **BOM**

  CVE-ID: CVE-2006-0391

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Directory traversal may occur while unpacking archives with BOM

  Description: The BOM framework handles the unpacking of certain types of archives. This framework is vulnerable to a directory traversal attack that can allow archived files to be unpacked into arbitrary locations that are writable by the current user. This update addresses the issue by properly sanitizing those paths. Credit to Stéphane Kardas of CERTA for reporting this issue.

- **Directory Services**

  CVE-ID: CVE-2005-2713, CVE-2005-2714

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Malicious local users may create and manipulate files as root

  Description: The passwd program is vulnerable to temporary file attacks. This could lead to privilege elevation. This update addresses the issue by anticipating a hostile environment and by creating temporary files securely. Credit to Ilja van Sprundel of Suresec LTD, vade79, and iDefense (idefense.com) for reporting this issue.

- **FileVault**

  CVE-ID: CVE-2006-0386

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

Impact: FileVault may permit access to files during when it is first enabled

Description: User directories are mounted in an unsafe fashion when a FileVault image is created. This update secures the method in which a FileVault image is created.

- **IPSec**

  CVE-ID: CVE-2006-0383

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Remote denial of service against VPN connections

  Description: Incorrect handling of error conditions for virtual private networks based on IPSec may allow a remote attacker to cause a service interruption. This update addresses the issues by correctly handling the conditions that may cause crashes. Credit to OUSPG from the University of Oulu, NISCC, and CERT-FI for coordinating and reporting this issue.

- **LibSystem**

  CVE-ID: CVE-2005-3706

  Available for: Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Attackers may cause crashes or arbitrary code execution depending upon the application

  Description: An attacker able to cause an application to make requests for large amounts of memory may also be able to trigger a heap buffer overflow. This could cause the targeted application to crash or execute arbitrary code. This update addresses the issue by correctly handling these memory requests. This issue does not affect systems prior to Mac OS X v10.4. Credit to Neil Archibald of Suresec LTD for reporting this issue.

- **Mail**

  CVE-ID: CVE-2006-0395

  Available for: Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Download Validation fails to warn about unsafe file types

  Description: In Mac OS X v10.4 Tiger, when an email attachment is double-clicked in Mail, Download Validation is used to warn the user if the file type is not "safe". Certain techniques can be used to disguise the file's type so that Download Validation is bypassed. This update addresses the issue by presenting Download Validation with the entire file, providing more information for Download Validation to detect unknown or unsafe file types in attachments.

- **perl**

  CVE-ID: CVE-2005-4217

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: Perl programs may fail to drop privileges

  Description: When a perl program running as root attempts to switch to another user ID, the operation may fail without notification to the program. This may cause a program to continue to run with root privileges, assuming they have been dropped. This can cause security issues in third-party tools. This update addresses the issue by preventing such applications from continuing if the operation fails. This issue does not affect Mac OS X v10.4 or later systems. Credit to Jason Self for reporting this issue.

- **rsync**

  CVE-ID: CVE-2005-3712

  Available for: Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Authenticated users may cause an rsync server to crash or execute arbitrary code

  Description: A heap-based buffer overflow may be triggered when the rsync server is used with the flag that allows extended attributes to be transferred. It may be possible for a malicious user with access to an rsync server to cause denial of service or code execution. This update addresses the problem by ensuring that the destination buffer is large enough to hold the extended attributes. This issue does not affect systems prior to Mac OS X v10.4. Credit to Jan-Derk Bakker for reporting this issue.

- **Safari**

  CVE-ID: CVE-2006-0390/CVE-2005-4504

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Viewing a maliciously-crafted web page may result in arbitrary code execution

  Description: A heap-based buffer overflow in WebKit's handling of certain HTML could allow a malicious web site to cause a crash or execute arbitrary code as the user viewing the site. This update addresses the issue by preventing the condition causing the overflow. Credit to Suresec LTD for reporting this issue.

- **Safari**

  CVE-ID: CVE-2006-0387

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Viewing a malicious web page may cause arbitrary code execution

  Description: By preparing a web page including specially-crafted JavaScript, an attacker may trigger a stack buffer overflow that could lead to arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional bounds checking.

- **Safari**

  CVE-ID: CVE-2006-0388

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Remote web sites can redirect to local resources, allowing JavaScript to execute in the local domain

  Description: Safari's security model prevents remote resources from causing redirection to local resources. An issue involving HTTP redirection can cause the browser to access a local file, bypassing certain restrictions. This update addresses the issue by preventing cross-domain HTTP redirects.

- **Safari, LaunchServices**

  CVE-ID: CVE-2006-0848

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Viewing a malicious web site may result in arbitrary code execution

  Description: It is possible to construct a file which appears to be a safe file type, such as an image or movie, but is actually an application. When the "Open `safe' files after downloading" option is enabled in Safari's General preferences, visiting a malicious web site may result in the automatic download and execution of such a file. A proof-of-concept has been detected on public web sites that demonstrates the automatic execution of shell scripts. This update addresses the issue by performing additional download validation so that the user is warned (in Mac OS X v10.4.5) or the download is not automatically opened (in Mac OS X v10.3.9).

- **Syndication**

  CVE-ID: CVE-2006-0389

  Available for: Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Subscriptions to malicious RSS content can lead to cross-site scripting

  Description: Syndication (Safari RSS) may allow JavaScript code embedded in feeds to run within the context of the RSS reader document, allowing malicious feeds to circumvent Safari's security model. This update addresses the issue by properly removing JavaScript code from feeds. Syndication is only available in Mac OS X v10.4 and later.

The following security enhancements are also included in this update:

- **FileVault.** AES-128 encrypted FileVault disk images are now created with more restrictive operating system permissions. Credit to Eric Hall of DarkArt Consulting Services for reporting this issue.
- **iChat.** A malicious application named Leap.A that attempts to propagate using iChat has been detected. With this update for Mac OS X v10.4.5 and Mac OS X Server v10.4.5, iChat now uses Download Validation to warn of unknown or unsafe file types during file transfers.

You should use caution when opening files that are obtained from the network. See Safety tips for handling email attachments and content downloaded from the Internet.

Front Row: "iTunes cannot play this song" alert message

This article has been archived and is no longer updated by Apple.

If you see an alert message that says "iTunes cannot play this song" when you try to play Shared Music, it usually means that the computer you are trying to use for playback isn't authorized to play the content.

To fix the issue:

1. Exit Front Row.
2. Open iTunes and try to play the same song.
3. iTunes will ask you to enter the Apple ID and password used to purchase the music. Enter the appropriate Apple ID and password to authorize the computer.
4. Verify that the song will play in iTunes.
5. Go back to Front Row and play the content.

Front Row: "There is a problem playing this shared video" alert message

This article has been archived and is no longer updated by Apple.

If you see an alert message that says "There is a problem playing this shared video: The shared video server may be having problems playing this video" when you try to play Shared Video, it usually means that the computer you are trying to use for playback isn't authorized to play the content.

To fix the issue:

1. Exit Front Row by pressing the Menu button on the Apple Remote.
2. Open iTunes and try to play the same video.
3. iTunes will ask you to enter the Apple ID and password used to purchase the video, in order to authorize that computer to play the video.
4. Verify that the video will play in iTunes.
5. Go back to Front Row. Now that the computer has been authorized, you can use Front Row to play the content.

Front Row: Shared photo library does not appear in menu

This article has been archived and is no longer updated by Apple.

If a shared photo library does not appear in a Front Row menu, follow these steps:

1. While still in Front Row, press the Command ( ), Option, and Escape keys simultaneously. This will quit the Front Row application.
2. Open iPhoto and make sure the shared photo library appears in iPhoto. If it doesn't, make sure both computers are running iPhoto 6.0.2 or later and make sure the source computer has sharing enabled in the iPhoto preferences.
3. Start Front Row again.

The shared photo library should now appear in the menus.

Upgrading to Front Row 1.2.1 displays "wrong version" alert messages

This article has been archived and is no longer updated by Apple.

Playing shared music, photos, or videos using Front Row version 1.2.1 requires the latest versions of iTunes and iPhoto. Before you install Front Row 1.2.1, update iPhoto and iTunes. You'll need to open iTunes and iPhoto at least once before you run the Front Row installer.

If you have already started the update and received the "wrong version" message:

1. Close Front Row.
2. Install the iPhoto and iTunes updates, as described above.
3. Open iTunes and iPhoto to complete the installation.
4. Then go back and open Front Row.

Logic Pro/Express 7.2: Ducker is dimmed in Plug-in list

This article has been archived and is no longer updated by Apple.

The Ducker is only available on Bus and Output channels. When you click an insert for any other type of audio channel, it will be dimmed (unavailable) in the list of Logic plug-ins that comes up. See the Logic 7.2 Late Breaking News document for more information.

Published Date: Feb 20, 2012

Final Cut Pro: Dual mono audio channels in HDV clip appear as stereo when sent to Soundtrack Pro

This article has been archived and is no longer updated by Apple.

Symptom

An HDV clip captured as dual mono and sent from Final Cut Pro to Soundtrack Pro may have the wrong audio channel assignments. Rather than two independent mono tracks, the clip appears to have a single stereo track, with the first channel duplicated to both sides of the stereo track.

Solution

Capture the HDV clip as stereo, then both channels will send properly to Soundtrack Pro.

Published Date: Feb 20, 2012

Final Cut Pro 5: Use Quartz Extreme-capable video cards only

This article has been archived and is no longer updated by Apple.

You need a compatible computer with an AGP Quartz Extreme or PCI Express graphics card to install Final Cut Pro 5.

It's possible to add additional graphics cards after installing Final Cut Pro. If you do this with the intention of enabling an additional display for use with Final Cut Pro, be sure that the additional graphics card is one that is capable of supporting Quartz Extreme.

If you add a graphics card which is not capable of supporting Quartz Extreme technology, Final Cut Pro's windows may not function correctly on a display connected to that card. Final Cut Pro is not supported in such a configuration, and may fail to operate as expected.

About the Mac OS X 10.4.6 Update (combo)

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.6 Update (combo) updates Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4 or 10.4.5 to version 10.4.6 on both Intel-based Macs and PowerPC-based Macs. (If you are just updating from Mac OS X 10.4.5 to 10.4.6, see this article instead.)

Important: Please read before installing

- If you use iSync, you should perform a full sync with your devices before installing this update. Mac OS X 10.4.6 Update includes a later version of iSync with several improvements. For more information and before-you-install steps, see iSync 2.2: Read before updating to Mac OS X 10.4.6 or later, or before first sync.

- With the Mac OS X 10.4.6 system software update, PowerPC-based Macs will restart twice, instead of once, after the initial installation.
- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)

- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.

- If issues occur during installation--for example, Software Update quits unexpectedly, please see this article.

Installation

There are two ways to update to Mac OS X 10.4.6: Use Software Update or the standalone installer. You only need to use *one* of these methods to update your computer.

Automatic Software Update
Software Update, located in the **Apple** menu, will automatically download the latest Apple software. (Software Update might have linked you to this article to learn more about the update.) Note that the update's size may vary from computer to computer when installed using Software Update. Some updates must be installed prior to others, soyou may need to run Software Update more than once to get all of the available updates.

Standalone installer
Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. Two versions of the standalone installer are available from Apple Downloads: a delta and combo.

- The delta update installer (detailed in a different article) updates Mac OS X 10.4.5 to 10.4.6.

- The combo update installer for PowerPC and Intel-based Macs (described here) updates Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, and 10.4.5 to 10.4.6.

Improvements

This update offers many improvements. For a list of some of them, see About the Mac OS X 10.4.6 Update (delta).

This update also includes improvements delivered with earlier Mac OS X 10.4 updates, as described in these articles:

- About the Mac OS X 10.4.5 Update (delta)
- About the Mac OS X 10.4.4 Update (delta)
- About the Mac OS X 10.4.3 Update (delta)
- About the Mac OS X 10.4.2 Update (delta)
- About the Mac OS X 10.4.1 Update

Logic Express 7: No audio from songs created in Garageband 3

This article has been archived and is no longer updated by Apple.

When you try to play a song in Logic Express 7 that was created in GarageBand 3, you may get no sound.

That's because songs created in GarageBand 3 will have audio and instrument tracks assigned to output to bus 11 in Logic Express. Logic Express only supports up to 8 busses, so there's no audio.

To resolve this issue, reassign the output for each track to Out 1 to 2 on your audio hardware (or whatever outputs you usually use). The effects from Garageband on bus 1 and bus 2 will also be assigned to output to bus 10. Reassign bus 1 and 2 to output to your audio hardware as well.

Published Date: Feb 20, 2012

Logic Pro/Express 7: Unexpectedly quits during launch while reading Audio Unit cache

This article has been archived and is no longer updated by Apple.

During launch, Logic may quit unexpectedly when the progress message says "Initializing Core Audio (reading Audio Unit cache...)".

This occurs if the first language in the International preference pane is not a language for which the Finder is localized, such as Polish or Icelandic.

The issue is resolved in Logic 7.2.1 and later. To work around the issue in 7.2 or earlier:

1. Open System Preferences.
2. Select the International pane.
3. Drag a Finder-localized language, such as English, Deutsch, or Français to the top of the list.
4. Quit System Preferences.
5. Log out of Mac OS X, then log back in.

Front Row: Shared music or video won‘t play

This article has been archived and is no longer updated by Apple.

If you're trying to play shared music or a video selection from Front Row 1.2.1 but the music or video won't play, it may be because iTunes 6.0.4 has an open dialog box preventing it from playing.

To resolve this, exit Front Row by pressing the Menu button on the Apple Remote. Select iTunes with your mouse or trackpad and dismiss the dialog box.

iSync 2.2: "Connection to the phone failed" alert when syncing via Bluetooth

This article has been archived and is no longer updated by Apple.

After updating to iSync 2.2, included with Mac OS X 10.4.6 Update, you may see this alert message when attempting to sync your phone via Bluetooth:

> "Connection to the phone failed. Please make sure that your phone is turned on. If this error occurs again, please restart your phone"

Solution

Use these tips:

- First, make sure that your phone is on the list of iSync-compatible devices that support Bluetooth syncing.
- Make sure the phone has been paired with your computer.
- Configure your computer as a "Trusted" or "Authorized" device on your phone. The exact steps on how to do this vary from phone to phone--please consult your device's documentation. The goal is to eliminate the need to authorize your computer each time iSync wants to sync with your phone.
- If the phone has a "screen saver" running when you try to sync, this issue can occur. Wake your phone and try the sync again.
- Try turning your phone off and back on again.

If the issue persists, check with your cell phone provider or contact your phone manufacturer to see if any firmware updates are available for the phone, or for further assistance.

Mac OS X: Network Status is blank, or you see "Airport: Not Configured"

This article has been archived and is no longer updated by Apple.

Under certain circumstances, Network Status may appear blank in the Network pane of System Preferences, or you may see the message "Airport: Not Configured" under the Airport menu bar item. This can occur in Mac OS X 10.2 or later.

To resolve the issue, all you need to do is apply an arbitrary change to your network preferences. Follow these steps:

1. From the **Apple** menu, choose **System Preferences**.
2. Select the Network pane.
3. From the **Show** menu, choose **Network Port Configurations**.
4. Select a port which is currently inactive, such as Built-in FireWire; **or**, if all ports are already selected, then deselect a port such as Built-in FireWire.
5. Click the **Apply Now** button.
6. If you selected a port in the last step, deselect it now, or vice versa.
7. Click the **Apply Now** button again.

Applying the change should make your network ports available again. If you still have an issue connecting to the Internet, see the overview of Mac OS X Internet setup and troubleshooting topics.

Aperture can‘t import iPhoto Library from iPhoto 6.0.1 or 6.0.2

This article has been archived and is no longer updated by Apple.

If you choose **File > Import > iPhoto Library** within Aperture, and you have iPhoto 6.0.1 or 6.0.2 installed, then Aperture won't import the iPhoto Library.

However, this feature does work with iPhoto 6.0, so a workaround is to remove iPhoto 6.0.1 or 6.0.2 and reinstall iPhoto 6.0 from the iLife '06 Install DVD. Here's how:

1. From the folder `/Library/Receipts`, delete the files iPhoto.pkg and iPhotoContent.pkg.
2. Move the iPhoto application from the Applications folder to the Trash.
3. Run the iLife '06 Installer. When you get to the Installation Type screen, click the Customize button.
4. In the resulting window, deselect every option except iPhoto.

5. Click the Upgrade button.
6. After iPhoto 6.0 is installed, launch it, and quit it.
7. Import the iPhoto library into Aperture.
8. Use Software Update to re-update to the latest version of iPhoto.

This issue will be resolved in Aperture 1.1.

This document will be updated as more information becomes available.

Mac OS X 10.4 (Japanese): Garbled printout when printing with Morisawa NewCID fonts in Classic

This article has been archived and is no longer updated by Apple.

In the Japanese language version of Mac OS X 10.4 or later, in Classic, if you print a document that uses Morisawa NewCID fonts to a PostScript printer, some or all of the document will be garbled and unreadable. This can happen with Morisawa NewCID fonts originally installed from a floppy disk to the Mac OS 9 System Folder, but not with a Mac OS X version of the fonts.

To avoid this, use the Mac OS X version of the Morisawa NewCID fonts instead of the Classic versions. You might want to use Font Book to turn off the Classic version of the Morisawa fonts.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

AirPort: Which version of firmware is on the base station?

This article has been archived and is no longer updated by Apple.

To see what version of firmware is on your AirPort Express, AirPort Extreme, or AirPort Base Station, follow these steps:

1. If your computer connects to the AirPort network wirelessly, continue to step 2. If your computer connects to the AirPort network via wired Ethernet, skip to step 4.
2. From the Airport menu, choose your network name.

Tip: If the Airport menu does not appear in your menu bar, go to the Network pane of System Preferences, show AirPort, click the AirPort tab, and select "Show AirPort Status in menu bar."

3. If prompted for a network password, enter it.
4. Open AirPort Admin Utility, which is located in the Utilities folder inside your Applications folder.
5. Select a base station, and its firmware version appears as its "Apple Base Station" version.

For the latest firmware, see the AirPort support page.

About Security Update 2006-002

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2006-002, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Note: Security Update 2006-002 v1.1 was released to address an issue in which Safari was not updated by v1.0 if it had been moved from its default location in the Applications folder. This article describes the steps to follow if Safari is not located in the Applications folder.

If Safari is located in the Applications folder, Security Update 2006-002 is sufficient, and there is no need to install Security Update 2006-002 v1.1.

Security Update 2006-002

- **CoreTypes**

  CVE-ID: CVE-2006-0400

  Available for: Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Remote web sites can cause JavaScript to bypass the same-origin policy

  Description: When documents containing Javascript are loaded from a remote site, data access is restricted by the same-origin policy. However, under certain situations, maliciously-crafted archives can cause these restrictions to be bypassed. This update addresses the issue by flagging these documents as unsafe.

- **Mail**

  CVE-ID: CVE-2006-0396

  Available for: Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Double-clicking an attachment in Mail may result in arbitrary code execution

  Description: By preparing a specially-crafted email message with attachments, and enticing a user to double-click on that attachment within Mail, an attacker may trigger a buffer overflow. This could result in the execution of arbitrary code with the privileges of the user running Mail. This update addresses the issue by performing additional bounds checking. This issue does not affect systems prior to Mac OS X v10.4. Credit to Kevin Finisterre of DigitalMunition for reporting this issue.

- **Safari, LaunchServices, CoreTypes**

  CVE-ID: CVE-2006-0397, CVE-2006-0398, CVE-2006-0399

  Available for: Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Viewing a malicious web site may result in arbitrary code execution

  Description: Security Update 2006-001 addressed an issue where Safari could automatically open a file which appears to be a safe file type, such as an image or movie, but is actually an application. This update provides additional checks to identify variations of the malicious file types addressed in Security Update 2006-001 so that they are not automatically opened. This issue does not affect systems prior to Mac OS X v10.4. Credit to Will Dormann of CERT/CC and Andris Baumberger for reporting several of these issues.

The following non-security issues introduced by Security Update 2006-001 are also addressed by this update:

- **Download Validation:** Security Update 2006-001 could cause the user to be warned when provided with certain safe file types, such as Word documents, and folders containing custom icons. These unneeded warnings are removed with this update.
- **apache_mod_php:** A regression in PHP 4.4.1 that could prevent SquirrelMail from functioning is corrected with this update.

- **rsync:** A regression in rsync that prevented the "--delete" command line option from functioning is corrected with this update.

Published Date: Oct 7, 2016

iPhoto: "Display" and "Custom" values for cropping constraint result in ratios, not pixel dimensions

This article has been archived and is no longer updated by Apple.

When using the Crop tool, the Constrain pop-up menu gives you the option to choose common aspect ratios such as 5x7, 8x10, and 16x9. There will also be a choice named Display that lists your current display resolution, such as 1024x768.

Choosing the Display choice will crop the image to the *aspect ratio* of the current display resolution, **not** literally to those pixel dimensions. The same is true for any value you enter as a Custom choice via the Constrain menu.

Logic: You can mix PowerPC and Intel-based systems in Logic Node setups

This article has been archived and is no longer updated by Apple.

When configuring a group of computers as a Logic Node setup, it does not matter whether the master system and nodes use the same processor architecture. A PowerPC-based system running Logic Pro may connect to any combination of nodes running on PowerPC and Intel processors (the nodes must not all be the same). Likewise, an Intel-based system running Logic Pro may connect to nodes running on either processor architecture.

However, you must be sure that all nodes are running the same version Logic as the master, such as 7.2.0.

Logic: How to define a new default setting for a plug-in

This article has been archived and is no longer updated by Apple.

If you want to make a custom setting the default when you load a Logic plug-in, here's how to set it up:

Insert the chosen plug-in on a channel. Set the controls for the plug-in as you wish. Open the plug-in Settings menu by clicking the arrow in the upper left area of the plug-in window.

Select **Save Setting As...**, and name the preset "#default".

The next time you insert the plug-in, the saved setting will be the new default. You can repeat this procedure any time you want to change the default.

iPhoto 6: Photos appear too dark or wrong color

This article has been archived and is no longer updated by Apple.

When viewing a photo in iPhoto 6, an image may appear darker than expected, or to have the wrong hue, tint, or color balance as compared to another application.

This happens because iPhoto now uses ColorSync to ensure accuracy, and ColorSync relies in part on knowing the source profile. If the photo lacks a color profile, iPhoto may substitute a best-guess profile based on predefined criteria.

For best results, set your camera and (if applicable) adjust the other software in your workflow so that profiles are embedded and/or preserved. Additionally, you should calibrate your display using the Displays preference pane or a third-party hardware calibration device, which is the superior method.

Mac OS X 10.4: About Disk Utility‘s secure erase options

This article has been archived and is no longer updated by Apple.

In Disk Utility in Mac OS X 10.4 Tiger, there are four Security Options you can use if you wish to securely erase a volume:

- Don't Erase Data
- Zero Out Data
- 7-Pass Erase
- 35-Pass Erase

"Don't Erase Data" option

Erases directory information so that data is no longer accessible. The data itself is left unchanged on the disk until its disk space is required, at which point it is written over. Data is potentially recoverable until then. This option is the quickest, but least secure.

"Zero Out Data" option

Writes zeros over all data on the disk. This option provides good data security in a minimum amount of time.

"7-Pass Erase" option

Writes data over the entire disk seven times. This provides a highly secure erasure of disk data. A 7-Pass erase takes 7 times longer than a Zero Out Data erase.

Advanced information: The 7-Pass Erase option conforms to the DoD 5220.22-M specification. This specification calls for three passes, but Disk Utility performs seven. Visit here for more details on the specification.

7 pass overwrite data
(DoD 5220.22-M specification)

	Data written	
Pass	Inbinary notation	Inhexadecimal notation
1	11110110	0xF6
2	00000000	0x00
3	11111111	0xFF
4	Random	Random
5	00000000	0x00
6	11111111	0xFF
7	Random	Random

"35-Pass Erase" option

Writes data over the entire disk 35 times. This option provides highly effective security against the recovery of data. It requires 35 times more time to perform than the Zero Out option.

Advanced information: The 35-Pass erase option uses the Gutmann algorithm, which means 35 patterns are written to the disk to overwrite data. You can find out more about the Gutmann method here or here. In the chart below, RLL means Run Length Limited, and MFM means Modified Frequency Modulation.

35 pass overwrite data
(Gutmann)

	Data written			
Pass	In binary notation	In hexadecimal notation	Encoding scheme targeted	
1	Random	Random		
2	Random	Random		
3	Random	Random		
4	Random	Random		
5	01010101 01010101 01010101	55 55 55	(1,7) RLL	MFM

Aperture 1.1: Library not backward compatible with Aperture 1.0.x

This article has been archived and is no longer updated by Apple.

The first time you run Aperture 1.1, you will see an alert message that lets you know that your Aperture Library will be converted to a new format.

Once converted, the Aperture Library will no longer work with Aperture 1.0 or 1.0.1.

Tip: If you want to maintain backward compatibility, make a copy of your Aperture Library before converting it.

By default, the Aperture Library is located in your Pictures folder. If you have selected a different location, it will be noted in Aperture Preferences.

iSight: How to locate the serial number

This article has been archived and is no longer updated by Apple.

Learn how to locate the serial number of an iSight camera. This article applies to standalone iSight cameras, such as in this article, but not iSight cameras built into some iMacs and all MacBook Pro computers.

There are several ways to locate the serial number of a standalone iSight camera. The serial number consists of eleven letters and numerals, such as "W933355KCBL".

Look on the iSight camera's shipping box

Remove the sleeve from the box that the camera came in and look at the back of the box where iSight features are listed.. The serial number ("Serial No.") is printed on a white label.

Look on the bottom of the iSight camera

On the bottom of the camera, near the FireWire connector, the serial number is printed in small, white characters. If you find it difficult to read the serial number this way and you don't have the original shipping box, you can use the next method.

Open iSight Updater

1. Start up in Mac OS X.
2. Connect your iSight camera to your computer.
3. From the Finder's **Go** menu, choose **Utilities**.
4. In the Utilities folder, look for an iSight Updater folder.
    - If you see more than one iSight Updater folder, open the one with the highest version number, such as "iSight Updater 1.0.3".
    - If you don't see an iSight Updater folder, use Software Update to check for available iSight updates.
5. In the iSight Updater folder is an iSight Updater application. Open the application and the serial number will be visible.

    Note: If you've already installed the iSight update, in which case "(up do date)" appears in the iSight Update window, you do not need to click Install.

6. After you've made note of the serial number, press Command-Q to quit iSight Updater.

Logic: Mixing versions of Logic Node and Logic Pro causes unexpected quitting

This article has been archived and is no longer updated by Apple.

Systems running version 7.1.0 or 7.1.1 of Logic Node can connect to Logic Pro 7.2 (Intel), leading Logic Pro to quit unexpectedly.

To avoid this situation, be sure to update any systems running Logic Node to the same version number as the system running Logic Pro. If you are running Logic Pro 7.2, then Logic Node 7.2 should be running on all connected systems. The Installer for Logic Node is located on the same disc as the Logic Pro Installer.

Final Cut Studio is not supported on Mac Mini (Early 2006)

This article has been archived and is no longer updated by Apple.

If you have a Mac Mini (Early 2006), the Final Cut Studio (Universal) crossgrade Installer does not prohibit you from installing the pro applications, but this configuration does not meet the minimum system requirements for Final Cut Studio.

See the Final Cut Studio system requirements for complete requirements.

Note: The integrated graphics processor in the Mac Mini (Early 2006) does not permit float processing in Motion and will result in degraded performance and other issues in Motion and other Final Cut Studio applications.

Safari: Blank icon after installing Security Update 2006-002 v1.0

This article has been archived and is no longer updated by Apple.

After you install Security Update 2006-002 v1.0, Safari might have a blank icon that won't launch Safari. This can happen if you moved Safari out of your Applications folder before installing the update. To fix it, follow these steps:

1. Drag the copy of Safari with the blank icon from your Applications folder to the Trash. **Note:** Don't worry—this will not affect your bookmarks or preferences.
2. Empty the Trash.
3. Download the Security Update 2006-002 v1.1 for PowerPC or Intel.
4. Install the Security Update 2006-002 v1.1
5. When the installation is complete, restart your computer.

Your existing version of Safari will now be up to date.

Troubleshooting photo transfers with iPod Camera Connector and Canon EOS 20D

This article has been archived and is no longer updated by Apple.

You may experience difficulty when attempting to transfer photos using the iPod Camera Connector with a Canon EOS 20D and a supported iPod. You may see one or more of the following error messages on the iPod:

- No card inserted
- Camera not connected
- Device not supported

Solution

Try one or more of the following troubleshooting steps to resolve this issue and allow photos to be transferred a supported iPod:

- Change the camera's transfer mode from Normal (Type 4) to PTP (check you camera's documentation to see how to change the transfer mode)..
- Press the blue playback button on the rear of the Canon EOS 20D before connecting it to the iPod.
- With the camera, iPod Camera Connector, and iPod all connected and turned on, reset the iPod and press the blue playback button on the camera

See "How to use the iPod Camera Connector" for additional troubleshooting information.

Mac OS X 10.4.5 and later support common methods of VPN NAT traversal

This article has been archived and is no longer updated by Apple.

VPN (Virtual Private Network) software allows users to connect to a remote computer network as if they were locally present. For example, VPN allows one to connect to a company network when working from home, telecommuting, or traveling. The remote network must have a VPN server to facilitate the connection.

In case you were wondering, VPN should work just fine with a network address translation (NAT) gateway to the Internet, which is common in many hotel and home router products.

Advanced information

Mac OS X 10.4.5 or later support:

- UDP Encapsulation of IPsec ESP Packets
- Negotiation of NAT-Traversal in the IKE
- draft-ietf-ipsec-nat-t-ike-02
- draft-ietf-ipsec-udp-encaps-02

Note: Multiple users behind the same NAT cannot use the same VPN server.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iLife ‘06: Don‘t move iLife support files from installed locations

This article has been archived and is no longer updated by Apple.

When installing iLife '06, you can specify custom paths for themes, instruments and other related items as part of the custom install options. If you specify custom install locations during installation, but later move these items, the iLife applications may no longer be able to locate or use these items.

After moving themes, loops or instruments, you are no longer able to locate these items in the iLife application.

After renaming the hard disk or another folder in the path to the theme, instrument or loop files, you are no longer able to locate these items in the iLife application.

Solution

If you have renamed the hard disk, or one of the folders in the path to the item you are missing, try changing the name of the disk or folder back to the original name.

Alternatively, check the preferences of the application you are using to see if you can add the new path as a place to check for themes or instruments.

You may also want to try moving the items to one of the default search paths for the associated application:

iDVD Themes
/Library/Application Support/iDVD/Themes/

iMovie Themes
/Library/Application Support/iMovie/Themes/

GarageBand Demo Songs
/Library/Application Support/GarageBand/

GarageBand Instruments
/Library/Application Support/GarageBand/Instrument Library/

GarageBand Loops
/Library/Audio/Apple/Apple Loops/Apple Loops for GarageBand

Apple, Inc.
Software License Agreement for Firmware Restoration CD
Single Use License for use on Apple-labeled Systems

PLEASE READ THIS SOFTWARE LICENSE AGREEMENT ("LICENSE") CAREFULLY BEFORE USING THE APPLE SOFTWARE. BY USING THE APPLE SOFTWARE, YOU ARE AGREEING TO BE BOUND BY THE TERMS OF THIS LICENSE. IF YOU DO NOT AGREE TO THE TERMS OF THIS LICENSE, DO NOT USE THE SOFTWARE. IF YOU DO NOT AGREE TO THE TERMS OF THE LICENSE, YOU MAY RETURN THE APPLE SOFTWARE TO THE PLACE WHERE YOU OBTAINED IT FOR A REFUND. IF THE APPLE SOFTWARE WAS ACCESSED ELECTRONICALLY, CLICK "DISAGREE/DECLINE". FOR APPLE SOFTWARE INCLUDED WITH YOUR PURCHASE OF HARDWARE, YOU MUST RETURN THE ENTIRE HARDWARE/SOFTWARE PACKAGE IN ORDER TO OBTAIN A REFUND.

IMPORTANT NOTE: This software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material, you should contact your legal advisor.

1. General. The software (including Boot ROM code), documentation and any fonts accompanying this License whether on disk, in read only memory, on any other media or in any other form (collectively the "Apple Software") are licensed, not sold, to you by Apple reserves all rights not expressly granted to you. The rights granted herein are limited to Apple's and its licensors' intellectual property rights in the Apple Software and do not include any other patents or intellectual property rights. You own the media on which the Apple Software is recorded but Apple and/or Apple's licensor(s) retain ownership of the Apple Software itself. The terms of this License will govern any software upgrades provided by Apple that replace and/or supplement the original Apple Software product, unless such upgrade is accompanied by a separate license in which case the terms of that license will govern.

Title and intellectual property rights in and to any content displayed by or accessed through the Apple Software belongs to the respective content owner. Such content may be protected by copyright or other intellectual property laws and treaties, and may be subject to terms of use of the third party providing such content. This License does not grant you any rights to use such content.

2. Permitted License Uses and Restrictions.
A. This License allows you to install and use one copy of the Apple Software on a single Apple-labeled computer at a time. You agree not to install, use or run the Apple Software on any non-Apple-labeled computer or to enable others to do so. The Apple Software may be used to reproduce materials so long as such use is limited to reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. This License does not allow the Apple Software to exist on more than one computer at a time, and you may not make the Apple Software available over a network where it could be used by multiple computers at the same time. You may make one copy of the Apple Software in machine-readable form for backup purposes only; provided that the backup copy must include all copyright or other proprietary notices contained on the original. Apple Boot ROM code and firmware is provided only for use on Apple-labeled hardware and you may not copy, modify or redistribute the Apple Boot ROM code or firmware, or any portions thereof.

B. Except as and only to the extent expressly permitted in this License or by applicable law, you may not copy, decompile, reverse engineer, disassemble, modify, or create derivative works of the Apple Software or any part thereof. THE APPLE SOFTWARE IS NOT INTENDED FOR USE IN THE OPERATION OF NUCLEAR FACILITIES, AIRCRAFT NAVIGATION OR COMMUNICATION SYSTEMS, AIR TRAFFIC CONTROL SYSTEMS, LIFE SUPPORT MACHINES OR OTHER EQUIPMENT IN WHICH THE FAILURE OF THE APPLE SOFTWARE COULD LEAD TO DEATH, PERSONAL INJURY, OR SEVERE PHYSICAL OR ENVIRONMENTAL DAMAGE.

3. Transfer. You may not rent, lease, lend or sublicense the Apple Software. Subject to the restrictions set forth below, you may, however, make a one-time permanent transfer of all of your license rights to the Apple Software to another party, provided that: (a) the transfer must include all of the Apple Software, including all its component parts, original media, printed materials and this License; (b) you do not retain any copies of the Apple Software, full or partial, including copies stored on a computer or other storage device; and (c) the party receiving the Apple Software reads and agrees to accept the terms and conditions of this License. All components of the Apple Software are provided as part of a bundle and may not be separated from the bundle and distributed as standalone applications. Apple Software provided with a particular Apple-labeled hardware product may not run on other models of Apple-labeled hardware.

Updates: If an Apple Software update completely replaces (full install) a previously licensed version of the Apple Software, you may not use both versions of the Apple Software at the same time nor may you transfer them separately.

NFR (Not for Resale) Copies: Notwithstanding other sections of this License, Apple Software labeled or otherwise provided to you on a promotional basis may only be used for demonstration, testing and evaluation purposes and may not be resold or transferred.

Restore Copies: Restore CDs or DVDs that may accompany an Apple hardware bundle, or are otherwise provided by Apple in connection with an Apple hardware bundle, contain a copy of the Apple Software that is to be used for diagnostic and restorative purposes only. These CDs and DVDs may be resold or transferred only as part of the Apple hardware bundle.

Academic Copies: If the Apple Software package has an academic label or if you acquired the Apple Software at an academic discount, you must be an Eligible Educational End User to use the Apple Software. "Eligible Educational End Users" means students, faculty, staff and administration attending and/or working at an educational institutional facility (i.e., college campus, public or private K-12 schools).

4. Consent to Use of Data. You agree that Apple and its subsidiaries may collect and use technical and related information, including but not limited to technical information about your computer, system and application software, and peripherals, that is gathered periodically to facilitate the provision of software updates, product support and other services to you (if any) related to the Apple Software. Apple may use this information, as long as it is in a form that does not personally identify you, to improve our products or to provide services or technologies to you.

5. Termination. This License is effective until terminated. Your rights under this License will terminate automatically without notice from Apple if you fail to comply with any term(s) of this License. Upon the termination of this License, you shall cease all use of the Apple Software and destroy all copies, full or partial, of the Apple Software.

6. Limited Warranty on Media. Apple warrants the media on which the Apple Software is recorded and delivered by Apple to be free from defects in materials and workmanship under normal use for a period of ninety (90) days from the date of original retail purchase. Your exclusive remedy under this Section shall be, at Apple's option, a refund of the purchase price of the product containing the Apple Software or replacement of the Apple Software which is returned to Apple or an Apple authorized representative with a copy of the receipt. THIS LIMITED WARRANTY AND ANY IMPLIED WARRANTIES ON THE MEDIA INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, OF SATISFACTORY QUALITY, AND OF FITNESS FOR A PARTICULAR PURPOSE, ARE LIMITED IN DURATION TO NINETY (90) DAYS FROM THE DATE OF ORIGINAL RETAIL PURCHASE. SOME JURISDICTIONS DO NOT ALLOW LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY LASTS, SO THE ABOVE LIMITATION MAY NOT APPLY TO YOU. THE LIMITED WARRANTY SET FORTH HEREIN IS THE ONLY WARRANTY MADE TO YOU AND IS PROVIDED IN LIEU OF ANY OTHER WARRANTIES (IF ANY) CREATED BY ANY DOCUMENTATION OR PACKAGING. THIS LIMITED WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS, AND YOU MAY ALSO HAVE OTHER RIGHTS WHICH VARY BY JURISDICTION.

7. Disclaimer of Warranties. YOU EXPRESSLY ACKNOWLEDGE AND AGREE THAT USE OF THE APPLE SOFTWARE IS AT YOUR SOLE RISK AND THAT THE ENTIRE RISK AS TO SATISFACTORY QUALITY, PERFORMANCE, ACCURACY AND EFFORT IS WITH YOU. EXCEPT FOR THE LIMITED WARRANTY ON MEDIA SET FORTH ABOVE AND TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, THE APPLE SOFTWARE IS PROVIDED "AS IS", WITH ALL FAULTS AND WITHOUT WARRANTY OF ANY KIND, AND APPLE AND APPLE'S LICENSORS (COLLECTIVELY REFERRED TO AS "APPLE" FOR THE PURPOSES OF SECTIONS 7 AND 8) HEREBY DISCLAIM ALL WARRANTIES AND CONDITIONS WITH RESPECT TO THE APPLE SOFTWARE, EITHER EXPRESS, IMPLIED OR STATUTORY, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES AND/OR CONDITIONS OF MERCHANTABILITY, OF SATISFACTORY QUALITY, OF FITNESS FOR A PARTICULAR PURPOSE, OF ACCURACY, OF QUIET ENJOYMENT, AND NON-INFRINGEMENT OF THIRD PARTY RIGHTS. APPLE DOES NOT WARRANT AGAINST INTERFERENCE WITH YOUR ENJOYMENT OF THE APPLE SOFTWARE, THAT THE FUNCTIONS CONTAINED IN THE APPLE SOFTWARE WILL MEET YOUR REQUIREMENTS, THAT THE OPERATION OF THE APPLE SOFTWARE WILL BE UNINTERRUPTED OR ERROR-FREE, OR THAT DEFECTS IN THE APPLE SOFTWARE WILL BE CORRECTED. NO ORAL OR WRITTEN INFORMATION OR ADVICE GIVEN BY APPLE OR AN APPLE AUTHORIZED REPRESENTATIVE SHALL CREATE A WARRANTY. SHOULD THE APPLE SOFTWARE PROVE DEFECTIVE, YOU ASSUME THE ENTIRE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES OR LIMITATIONS ON APPLICABLE STATUTORY RIGHTS OF A CONSUMER, SO THE ABOVE EXCLUSION AND LIMITATIONS MAY NOT APPLY TO YOU.

8. Limitation of Liability. TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT SHALL APPLE BE LIABLE FOR PERSONAL INJURY, OR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES WHATSOEVER, INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF PROFITS, LOSS OF DATA, BUSINESS INTERRUPTION OR ANY OTHER COMMERCIAL DAMAGES OR LOSSES, ARISING OUT OF OR RELATED TO YOUR USE OR INABILITY TO USE THE APPLE SOFTWARE, HOWEVER CAUSED, REGARDLESS OF THE THEORY OF LIABILITY (CONTRACT, TORT OR OTHERWISE) AND EVEN IF APPLE HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME JURISDICTIONS DO NOT ALLOW THE LIMITATION OF LIABILITY FOR PERSONAL INJURY, OR OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THIS LIMITATION MAY NOT APPLY TO YOU. In no event shall Apple's total liability to you for all damages (other than as may be required by applicable law in cases involving personal injury) exceed the amount of fifty dollars ($50.00). The foregoing limitations will apply even if the above stated remedy fails of its essential purpose.

9. Export Control. You may not use or otherwise export or reexport the Apple Software except as authorized by United States law and the laws of the jurisdiction in which the Apple Software was obtained. In particular, but without limitation, the Apple Software may not be exported or re-exported (a) into any U.S. embargoed countries or (b) to anyone on the U.S. Treasury Department's list of Specially Designated Nationals or the U.S. Department of Commerce Denied Person's List or Entity List. By using the Apple Software, you represent and warrant that you are not located in any such country or on any such list. You also agree that you will not use these products for any purposes prohibited by United States

law, including, without limitation, the development, design, manufacture or production of nuclear, missiles, or chemical or biological weapons.

10. Government End Users. The Apple Software and related documentation are "Commercial Items", as that term is defined at 48 C.F.R. §2.101, consisting of "Commercial Computer Software" and "Commercial Computer Software Documentation", as such terms are used in 48 C.F.R. §12.212 or 48 C.F.R. §227.7202, as applicable. Consistent with 48 C.F.R. §12.212 or 48 C.F.R. §227.7202-1 through 227.7202-4, as applicable, the Commercial Computer Software and Commercial Computer Software Documentation are being licensed to U.S. Government end users (a) only as Commercial Items and (b) with only those rights as are granted to all other end users pursuant to the terms and conditions herein. Unpublished-rights reserved under the copyright laws of the United States.

11. Controlling Law and Severability. This License will be governed by and construed in accordance with the laws of the State of California, as applied to agreements entered into and to be performed entirely within California between California residents. This License shall not be governed by the United Nations Convention on Contracts for the International Sale of Goods, the application of which is expressly excluded. If for any reason a court of competent jurisdiction finds any provision, or portion thereof, to be unenforceable, the remainder of this License shall continue in full force and effect.

12. Complete Agreement; Governing Language. This License constitutes the entire agreement between the parties with respect to the use of the Apple Software licensed hereunder and supersedes all prior or contemporaneous understandings regarding such subject matter. No amendment to or modification of this License will be binding unless in writing and signed by Apple. Any translation of this License is done for local requirements and in the event of a dispute between the English and any non-English versions, the English version of this License shall govern.

EA0348

By downloading or using this update, you accept the terms of the software license agreement.

Power Macintosh G3 Mini Tower: How to Use Video Mirroring

This document describes how to set up video mirroring on a Power Macintosh G3 Mini Tower.
This article has been archived and is no longer updated by Apple.
In order to enable video mirroring on a Power Macintosh G3 Mini Tower, use the "TV Mirroring" portion of the Control Strip, which is automatically installed on Power Macintosh G3 Mini Tower computers that have the A/V Personality Card. You can identify this by looking for the Control Strip portion that has a picture of a TV with antennas.

Within this control strip, you have several options:

- turn Video Mirroring on
- use NTSC standard
- use PAL standard
- overscan
- leave monitor on

To start video mirroring, choose "Turn Video Mirroring On".

Troubleshooting

Question: What if the TV Mirroring control strip is not present?
Answer: Make sure you have a Power Macintosh G3 Mini Tower computer with the A/V personality card.
If you have a Power Macintosh G3 Desktop computer, or if you do not have the A/V personality card, then the only way to use video mirroring is through a third-party PCI card. In that case, you should follow the instructions that came with the video card.

If you have a Power Macintosh G3 Mini Tower computer with the A/V personality card, and the control strip is not present, perform a "custom installation" of the "Control Strip" control panel with your Power Macintosh G3 CD.

Question: I have chosen "Turn Video Mirroring On" but I am getting no video on my TV.
Answer: Check your connections and make sure that the RCA or S-video cable is going from the "video out" ports of your computer, and the "video in" ports of your TV or VCR. Make sure that "Use NTSC Standard is selected within the TV mirroring control strip. Check the video input ports of your TV or VCR with another device.

Question: When I turn video mirroring on, my monitor turns off. Why won't it display to both monitor and my TV simultaneously?
Answer: Check the TV Mirroring portion of the Control Strip and make sure that the option "Leave Monitor On" is selected. If "Leave Monitor On" is disabled, then make sure your monitor is capable of displaying video at one of the following resolutions:

512 by 384 at 60 Hz
640 by 480 at 60 Hz
800 by 600 at 60 Hz
832 by 624 at 60 Hz

If your monitor does not work with one of those resolutions, it will not be able to display video simultaneously with your TV.

Finally, make sure that both your monitor and TV were connected to the computer before it started up (if you connected your monitor after the computer started up, you will need to restart).

Mac OS X Server 10.4.6 or later: changeip now requires fully qualified domain names

This article has been archived and is no longer updated by Apple.

Mac OS X Server 10.4.6 and later include changes to the command line utility "changeip" such that you must now use a fully qualified domain name (FQDN) with the command.

Previously, changeip could be invoked with the server's short name, like this:

```
changeip /LDAPv3/127.0.0.1 10.0.1.1 10.0.1.2 testserver testserver2
```

Using the FQDN in Mac OS X Server 10.4.6 or later, your command would look like this:

```
changeip /LDAPv3/127.0.0.1 10.0.1.1 10.0.1.2 testserver.example.com testserver2.example.com
```

Before running changeip, be sure you have updated the server's hostname in DNS to match the hostname provided to changeip; otherwise errors will be logged in system.log, and services may not function properly.

Xsan: Clients have kernel panic when modifying Xsan volume settings

This article has been archived and is no longer updated by Apple.

An Xsan client or metadata controller (MDC) will experience a kernel panic if you do not unmount a volume from it before performing an action on that volume in Xsan Admin that will change the volume. Though you can change some settings for an existing volume, other changes require the volume to be re-initialized (you'll see a warning in these cases).

In order to avoid this behavior, unmount and stop Xsan Volumes before changing their configuration in any way that requires the volume to be rebuilt.

Logic Pro/Express 7.2: Using compressed audio will not increase track counts

This article has been archived and is no longer updated by Apple.

Logic Pro/Express 7.2 now allows you to play compressed audio formats such as AAC, Apple Lossless, and MP3 directly in the Arrange window. Because these files are smaller in terms of disk space, you might think that they would also require less CPU and disk drive bandwidth to play back. However, this is not the case.

In fact, directly playing compressed audio in your song may actually require more system resources than playing back an equivalent number of uncompressed audio tracks. In situations where the added overhead becomes a problem, you may get better performance by converting your compressed audio tracks to AIFF or WAVE files.

Select the relevant regions in the Arrange window and choose **Arrange > Audio > Convert Regions to New Audio Files**. A file selector will appear, allowing you to choose a destination file format for the copied files.

iMovie HD: About limiting clip length when importing

This article has been archived and is no longer updated by Apple.

iMovie HD 6 allows you to limit the length of video clips when you are importing from a DV or HDV camera.

To configure these settings:

1. Open iMovie HD.
2. From the **iMovie HD** menu, choose **Preferences**.
3. Click the Import tab.

You can select the following settings:

- Start a new clip at each scene break
- Limit scene length

With the "Start a new clip at each scene break" option, iMovie HD automatically creates a new clip wherever there's a scene break (places where the camcorder was switched from pause to record during shooting).

With the "Limit scene length" option, iMovie HD automatically creates a new clip when importing reaches the time limit you've specified.

Notes

- These settings are only effective when importing from DV and HDV sources. Capturing from an iSight camera does not allow you to limit scene length with these settings.
- iMovie HD does not break up scenes shorter than 30 frames (about one second), so some short scenes may be merged with longer ones when imported.
- If automatic scene detection is turned on and your imported footage isn't being broken at scene breaks, make sure the date and time on your camera are set correctly.

Logic Pro/Express: Unexpected insert bypassed by automation on instrument tracks

This article has been archived and is no longer updated by Apple.

When automating the bypass state of an insert on an Instrument track, the insert bypassed is offset by one in comparison with an Audio track. For example, setting Insert 2 to bypass on an Instrument track seems to bypass the first insert.

This is actually the expected behavior, because the Insert for the Instrument itself is treated as Insert 1 by the track automation. The DSP inserts at the top of the channel strip are numbered from Insert 2 and up.

On Audio tracks, the top DSP insert is considered Insert 1.

Updating from Aperture 1.0.x to 1.1

This article has been archived and is no longer updated by Apple.

Below are some suggestions for updating from Aperture version 1.0.x to version 1.1 in several different, yet common, scenarios.

Updating from Aperture 1.0.1 to 1.1 on a PowerPC-based Mac

1. Update to Mac OS X 10.4.6 or later.
2. Use Software Update again to install the Aperture 1.1 Update.

Updating from Aperture 1.0 to 1.1 on a PowerPC-based Mac

1. Run Software Update to install Aperture 1.0.1 and Mac OS X 10.4.6 or later.
2. Open Aperture 1.0.1 at least once.
3. Run Software Update again to install Aperture 1.1.

Using an Aperture 1.1 Installation Disc on an Intel-based Mac

1. Update the system to Mac OS X 10.4.6 or later.
2. Install Aperture from the disc.

Using an Aperture 1.0 Installation Disc on an Intel-based Mac

1. Update the system to Mac OS X 10.4.6 or later.
2. Install Aperture 1.0 from the disc.
3. Run Software Update to install the Aperture 1.0.1 Update.
4. Run Software Update again to install the Aperture 1.1 Update.

Moving your Aperture library from a PowerPC Mac to an Intel Mac

1. If you have not already updated to Aperture 1.0.1 on the PowerPC-based Mac, do so now, and open Aperture 1.0.1 at least once after the update.
2. Follow the steps (above) for installing Aperture on an Intel-based Mac.
3. Copy your existing Aperture Library to the Pictures folder (`~/Pictures`) on the Intel-based Mac.

After Power Mac G5 wakes from sleep, optical media appears to be blank

This article has been archived and is no longer updated by Apple.

If your optical disc drive tray is open when your Power Mac G5 goes to sleep, it will retract the tray as it goes to sleep. Then when the computer wakes up, the disc may appear in the Finder as blank media.

This can occur with blank CDs or DVDs as well as commercially-produced CDs or DVDs.

If this occurs, eject the disc icon on your desktop by dragging it to the Trash in the dock. Reinsert the disc and close the drive tray. The optical drive will recognize the media correctly.

Front Row: Videos only play on primary display

This article has been archived and is no longer updated by Apple.

If you have multiple displays connected to your Mac, you may notice that Front Row will play videos on the "primary" display only. If you want the videos to play on a different display, you can change the "primary display" assignment:

1. From the Apple menu, open System Preferences.
2. Choose the Displays pane of System Preferences.
3. Select the **Arrangement** tab.
   (If you don't see one, you may not have the other display connected at the moment—reconnect the display and try again.)
4. Drag the menu bar (the white line on top of the display icon) to the display you want the to use as the primary display. The system will switch to the new primary assignment immediately.
5. Close the Display preference pane and watch your Front Row videos!

Mac OS X: Adjusting Date & Time for Australian Daylight Saving Time‘s extra week in 2006

This article has been archived and is no longer updated by Apple.

In Australian states that observe Daylight Saving Time, Summer Time extends for an extra week in 2006. This means that clocks will be set back to standard time on 02-April-2006 instead of 26-March-2006. Learn how to make sure your Mac OS X clock displays the correct time during the intervening week if you live in one of the affected states.

This document applies to all versions of Mac OS X in Australian states that observe Daylight Saving Time.

Mac OS X 10.4

Download and install the Mac OS X 10.4.5 Update or later. This contains updated Daylight Saving Time rules that maintain the proper time automatically.

Mac OS X 10.3.9 or earlier

You have two options: Select a different time zone, or set the time manually.

Select a different time zone

Note: Use this option if it is necessary to maintain the correct offset from Universal Time—for example, in an environment where Kerberos authentication is used.

1. Select a time zone in Date & Time preferences that is one hour to the east of your location—for example, by clicking on an area of northeastern Russia or the South Pacific.
2. On 02-April-2006, reverse this change by reselecting the original time zone.

Note: This option is not available for users in South Australia.

Set the time manually

1. Deselect the "Set Date & Time automatically" option in Date & Time preferences if it's enabled.
2. Manually set the correct time.
3. Click Save.
4. On 02-April-2006, reverse this change by checking "Set Date & Time automatically" or by manually setting the correct time again.

Mac OS X: Adjusting Date & Time for Indiana Daylight Saving Time changes in 2006

This article has been archived and is no longer updated by Apple.

In the United States, the state of Indiana observes Daylight Saving Time (DST) for the first time in many counties on April 2, 2006 (02-April-2006). Some counties in Indiana also change from the Eastern to Central time zone. This article explains how to adjust your Mac for these changes.

Note: If you live in an Indiana county that observed Daylight Saving Time before 2006, no changes are necessary.

If you live in an Indiana county that changes from Eastern to Central time as of April 2, 2006

Use Date & Time preferences to choose a Central time zone city, such as Chicago, on or after 02-April-2006.

If you live in an Indiana county that is not changing to Central time and has not observed DST before

Your steps depend on which version of Mac OS X you are using.

Mac OS X 10.4 or later

Download and install the Mac OS X 10.4.5 Update, or later. This contains updated Daylight Saving Time rules to automatically maintain the proper time.

Mac OS X 10.3.9 or earlier

Use Date & Time preferences to choose an Eastern time zone city, such as Detroit, on or after 02-April-2006.

Bonjour for Windows: Error -995 when repairing software in Spanish

This article has been archived and is no longer updated by Apple.

If your primary language is Spanish and you attempt to Repair a Bonjour for Windows installation, you may see these alert messages:

> "Error -995. I/O operation has been cancelled due to a subprocess output or an application request."
>
> "Installation was interrupted. The system hasn't been modified"
>
> "Re-run the installer"

These are caused by using a Windows installer that is earlier than version 3. To resolve the issue, install the latest version of the Windows installer, and and rerun the Repair.

Mac OS X 10.4.5 or later: Java issues after installing J2SE 5.0 Release 4 update

This article has been archived and is no longer updated by Apple.

When you install the software update for Java 2 Platform Standard Edition (J2SE) 5.0 Release 4 for Mac OS X v10.4.5 or later, it will change the default version of Java virtual machine from Java 1.4.2 to Java 5.0.

If the Java applications or Java-enabled websites that you use most often do not behave as expected after applying the Java 5.0 Release 4 update, you can consider changing the Java default back to 1.4.2.

To do that, follow these steps:

1. From the **Go** menu, choose **Utilities**.
2. Open the Java folder, then open the J2SE 5.0 folder inside of it.
3. Open the Java Preferences application.
4. At the top of the Java Preferences window, next to **Use version**, is a pop-up menu where you can set the version used for applets.
5. In the middle of the Java Preferences window, you should see **Java Application Runtime Settings**, and below that a while field in which you can drag the most preferred version to the top of the list. Drag 1.4.2 to the top. This controls the order in which Java versions are used for applications that use the Java Network Launching Protocol.
6. Click the Save button, and quit Java Preferences.

iMovie: Distortion at edges of analog content

This article has been archived and is no longer updated by Apple.

When importing video from an analog source (such as a VCR) using a DV converter, you may see distortion at the edges of the image.

Some analog sources may produce distortion or noise outside of the "TV safe" area of the image. Most television screens "overscan" so that the outer edges of the image are not normally visible. When importing footage from a VCR or other analog source using a DV converter, you may see these parts of the image because iMovie shows the full frame of information.

If you want to mask or remove the distortion from the edges of your final project, consider using iMovie's Letterbox effect (available in iMovie HD 5 or later) to cover the distortion at the top or bottom of frame. Alternatively, apply a third-party effect, if you have one, to pillarbox or windowbox the footage, or an effect which can zoom or crop the image.

iMovie: How to move clips from one project to another

This article has been archived and is no longer updated by Apple.

Learn how to move clips from one iMovie project to another.

iMovie HD 6 and later

In iMovie HD 6, you can open more than one project at a time. Simply open both projects, and drag the items from one iMovie project window to the other.

Tip: Only drag from one track at a time and drag any audio tracks separately.

Alternatively, you can select the item and cut (Command-X) or copy (Command-C) it, then paste (Command-V) it into the other project window. Be aware that copying and pasting audio could result in overlapping audio (or even a longer piece of audio obscuring or covering up a shorter piece of audio).

iMovie HD 5

In iMovie HD 5 you can copy and paste items between projects. Select the item you want to move, and cut (Command-X) or copy (Command-C) the item. Close the originating project, and open the project where you want to place this item. Paste the item (Command-V) to import the clip.

All versions of iMovie, including iMovie 4 and earlier

In iMovie, you can export or share the desired clip as Full Quality. Then, import the resulting file into the other project. **Tip**: iMovie 4 and later will allow you to share just selected clips. Consider selecting just the clip you wish to move to the other project, and use this option.

Alternatively, locate the resulting file in the project's Media folder in the Finder, and import this file into the other project (in iMovie, **File** > **Import**).

Soundtrack Pro: How to use AJA Io to monitor audio

This article has been archived and is no longer updated by Apple.

You can use the AJA Io, an external output device, to monitor audio with Soundtrack Pro. However, setting up the Io is different that setting up a typical Core Audio interface. Here's how to do it:

1. Import a video into a Soundtrack Pro project to monitor audio through the AJA Io.
2. Open the Soundtrack Pro preferences (**Soundtrack Pro** > **Preferences**).
3. Click the Video Out button.
4. Select the appropriate AJA output option from the Video Out pop-up menu.

5. Make sure video out is enabled. You can toggle Video Output on and off by pressing Command-F12. (Soundtrack Pro playback must be stopped while toggling the setting).

Mac OS X Server 10.4: Some print jobs do not update page log or user quotas

This article has been archived and is no longer updated by Apple.

Some print jobs sent to a Mac OS X Server 10.4 Print Server queue are not being recorded in the page log (`/var/log/cups/page_log`). If a job is not recorded in the page log, it will not count against the user's print quota.

For many printer models, you can resolve this issue by the installing the Mac OS X Server 10.4.6 update. If it does not resolve the issue with your printer, contact the printer manufacturer to see if an updated PPD is available. If not, set up the print queue using the Generic PPD instead of the printer-specific PPD.

For new queues, Server Admin will use the Generic PPD by default.

For existing queues with a printer-specific PPD, do the following:

1. Open Printer Setup Utility.
2. Select the appropriate printer.
3. Click the Show Info button.
4. From the **Name and Location** pop-up menu, choose **Printer Model**.
5. Click on the pop-up menu that lists the printer model, and choose **Generic**.
6. Click the Apply Changes button.

Note: Clients should continue to use the printer-specific PPD in order to take advantage of the specific features of the printer not available through the Generic PPD. Using the Generic PPD on the server does not affect the client's use of printer-specific features.

Power Macintosh G3 Computers: Reinstalling System Software

Reinstalling system software on a Power Macintosh G3 with any of the following options may require a separate drag install.

- Ultra Wide SCSI internal hard disk drive
- 10/100Base-T Ethernet card
- 128-bit 2D/3D professional graphics card with 8 MB of its own video memory (VRAM)

This article has been archived and is no longer updated by Apple.
The system software components necessary to support your computer's new options are installed in the System Folder on your computer*s hard disk. If you reinstall system software, you may have to reinstall some of these software components separately. They may not be included in the system software Installer.

To reinstall the software components, follow these steps:

1. Insert your Power Macintosh G3 CD.

2. Open the folder titled Important Extra System Software.

3. Drag the items from the folder onto the System Folder on your hard disk.

Note: If the folder is empty, then all of the necessary software components are included in the system software Installer.

4. When you see a message asking if you want to put these items in the Extensions folder, click OK.

5. Restart your computer.

Power Mac G5 (Late 2005): Power consumption and thermal output (BTU) information

This article has been archived and is no longer updated by Apple.

Learn about the power consumption and thermal output of Power Mac G5 (Late 2005) computers.

Dual 2.0 GHz Power Mac G5 (Late 2005)
Dual-core 2GHz PowerPC G5,1 GHz frontside bus/processor, 1MB L2 cache/core, 512MB of 533MHz DDR2 SDRAM (PC2-4200), 160GB Serial ATA drive, 16x SuperDrive with double-layer support (DVD+R DL/DVDRW/CD-RW), 3 PCI Express slots, NVIDIA GeForce 6600 LE with 128MB of GDDR SDRAM

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
165 W	450 W	563 BTU/h	1535 BTU/h

Dual 2.3 GHz Power Mac G5 (Late 2005)
Dual-core 2.3GHz PowerPC G5,1.15 GHz frontside bus/processor, 1MB L2 cache/core, 512MB of 533MHz DDR2 SDRAM (PC2-4200), 250GB Serial ATA drive, 16x SuperDrive with double-layer support (DVD+R DL/DVDRW/CD-RW), 3 PCI Express slots, NVIDIA GeForce 6600 LE with 256MB of GDDR SDRAM

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
165 W	450 W	563 BTU/h	1535 BTU/h

Quad 2.5 GHz Power Mac G5 (Late 2005)
Two dual-core 2.5GHz PowerPC G5,1.25 GHz frontside bus/processor, 1MB L2 cache/core, 512MB of 533MHz DDR2 SDRAM (PC2-4200), 250GB Serial ATA drive, 16x SuperDrive with double-layer support (DVD+R DL/DVDRW/CD-RW), 3 PCI Express slots, NVIDIA GeForce 6600 LE with 256MB of GDDR SDRAM

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
185 W	550 W	631 BTU/h	1877 BTU/h

Notes

- Power consumption data (Watts) is measured from the wall power source and includes all power supply and system losses. Additional correction is not needed.
- "CPU Max" is defined as running a compute-intensive test application that maximizes processor usage and therefore power consumption.
- These numbers reflect a 23° C (73.4° F) ambient running environment. Increased ambient temperatures will require faster fan speeds which will increase power consumption. At 35° C (95° F), 50 W should be added to reflect increased power consumption.

Shake 4.0: Handling interlace-like artifacts

This article has been archived and is no longer updated by Apple.

Some node configurations in Shake 4 may result in imagery that appears to have horizontal lines on some edges, resembling interlace artifacts, as seen in the following illustration:

One way around this is to apply an **Other-Bytes** node to promote affected nodes to 16 bits. This should remove the artifacts. You don't need to apply it to the entire script, just to the areas you find the behavior occurring.

The script in the following illustration shows a scenario where you might notice the artifacts. The **RotoShape** fills half the screen, and the **Primatte** is set to a primary scrub of blue.

In the next illustration, an **Other-Bytes** node is introduced before the **QuickPaint** node, and the artifacts do not occur:

Note: A side-effect of this using workaround results from Shake's internal tree optimization: You cannot demote the script to 8 bits with a second **Other-Bytes** node until after the **Max1** node (in the example script above). Placing it above **Invert1**, **Inside2**, or **Max1** will not remove the artifacts.

Fifth Generation iPod has a blank backlit display and beeps 3 times

This article has been archived and is no longer updated by Apple.

Symptom

- Unit may make a series of short beeps on startup
- Unit may boot to a blank white (backlit) display
- Unit may boot to a blank dark display

Resolution

1. Download and install iTunes 7.0 or later.
2. Open iTunes.
3. Connect your iPod to the computer via the iPod USB cable.
4. The iPod will make a series of beeps and the display will light up with no image. If the iPod only beeps but the display does **not** light up, leave the iPod connected until the display lights up. This may take up to 15 minutes while the iPod charges.
5. Reset the iPod by pressing the **Menu** and **Center** buttons for up to 10 seconds and release the buttons when you hear the beeps.
6. **Immediately** after releasing the **Menu** and **Center** buttons, press and hold the **Center** and **Play/Pause** buttons for 5 seconds the release the buttons.
7. The iPod should be visible in the iTunes Source pane. Select the iPod and **Restore** it from the **Summary** tab.
8. If the iPod is not recognized in iTunes, retry steps 1-7.
9. If you are still unsuccessful you can visit the Genius Bar at a local Apple Retail Store. Reference this knowledge base document number (303545) during your visit.
10. Alternately, eligible iPods can be sent to Apple for recovery by visiting http://depot.info.apple.com/ipod/

Mac OS X 10.4.6 or later: Scheduled shut down occurs at Login window even if users are logged in

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4.6 or later, if you have scheduled a shut down time in Energy Saver preferences, your Mac will shut down automatically at the scheduled time while at the login window, even if other users are logged in via fast user switching. This happens without any warning, which means if the logged-in accounts have files open that have unsaved changes, the unsaved data will be lost.

Note: If the computer is not at the Login window, scheduled shut down will still occur, but an alert will appear if any users have unsaved changes.

To avoid the possibility of losing unsaved changes when automatically shutting down from the Login window, do not leave the computer idle at the Login window if user accounts are logged in with unsaved work.

Tip: If you want to "lock the screen" while you're away from the computer, use the Security preferences option "Require password to wake this computer from sleep or screen saver," then start the screen saver or put the computer to sleep before leaving the computer idle.

Xsan: Issues after installing Xsan 1.1 or earlier on Mac OS X 10.4.6 or later

This article has been archived and is no longer updated by Apple.

If you install Xsan 1.1 or earlier on a computer that has already been updated to Mac OS X 10.4.6 or later, you may see these issues:

- Xsan volumes will not unmount properly (which may subsequently cause the system to become unresponsive or applications/processes to unexpectedly quit).
- Xsan volumes will not appear in the Sharing section of Workgroup Manager.

To prevent this behavior, follow these steps on each Xsan client and metadata controller (MDC).

1. Download this disk image.
2. Copy the file "acfsfs-Info.plist" from the disk image to the root of your home directory.
3. In the Terminal, run the following commands to install acfsfs-Info.plist into the appropriate location:

```
$ sudo cp acfsfs-Info.plist /System/Library/Filesystems/acfs.fs/Contents/Info.plist
$ sudo chmod 0644 /System/Library/Filesystems/acfs.fs/Contents/Info.plist
$ sudo chown root:wheel /System/Library/Filesystems/acfs.fs/Contents/Info.plist
```

4. Restart the system.

iDVD 6: No audio on finished DVD

This article has been archived and is no longer updated by Apple.

When previewing your project in iDVD, sound is audible. However, after burning the disc, there is no audio on the DVD when played back in the DVD Player application or on a set-top DVD player.

Solution

1. Update to iDVD 6.0.1.
2. Delete encoded assets from the project.
3. Burn another disc or Save as Disc Image, mount the image and test in DVD Player and then burn your DVD with Disk Utility.

This issue can also occur if third-party (non-Apple) QuickTime plug-ins are installed. If the issue still occurs after trying the steps above, check for third-party plug-ins in ~/Library/QuickTime/ and /Library/QuickTime. Move these to the desktop, and then log out and log back in to the computer.

If the issue continues after updating and removing any added plug-ins, create a new project in iDVD 6.0.1.

Note: Importing multiplexed (muxed) MPEG-1 and MPEG-2 footage in your iDVD project can also introduce this symptom. See the following articles for more information:

- 42996 "iMovie does not work with muxed MPEG-1 and MPEG-2 clips"
- 304158 "iMovie: Using footage from DV and non-DV sources"

Final Cut Pro 5: Color artifacts with the QuickTime > Sharpen filter

This article has been archived and is no longer updated by Apple.

In Final Cut Pro 5.1, the QuickTime variant of the Sharpen filter may produce undesired coloring artifacts when used with images or video clips that contain an alpha channel. This only happens on Intel-based Macs.

The effect where this is noticed is:
Effects > Video Filters > QuickTime > Sharpen

To workaround this issue, use an alternative filter, such as:
Effects > Video Filters > Sharpen > Sharpen

This document will be updated when more information becomes available.

About the security content of the Mac OS X 10.4.6 Update

This article has been archived and is no longer updated by Apple.

This document describes the security content of the Mac OS X 10.4.6 Update, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Mac OS X v10.4.6 Update

- **Firmware**

  CVE-ID: CVE-2006-0401

  Available for: Mac OS X 10.4.5

  Impact: Firmware password can be bypassed on Intel-based Macintosh computers

  Description: Intel-based Macintosh computers support the firmware password feature. Prior to this update, a person with physical access to the computer could bypass the firmware password and access Single User Mode. This update addresses the issue by enhancing the security provided by the firmware password. Credit to David Pugh of the University of Michigan for reporting this issue.

AirPort: Slow network connection in Mac OS X 10.4 Tiger

This article has been archived and is no longer updated by Apple.

Under certain circumstances, you might have a slow AirPort connection in Mac OS X 10.4.5 or earlier on an Intel-based Mac. (If you're into advanced network troubleshooting, you would see high packet loss associated with this issue.)

You should update to Mac OS X 10.4.6, which addresses this issue.

If that does not help, you should also consider whether you have sources of interference in the affected area.

Adding LUNs to Xsan Volumes fails

This article has been archived and is no longer updated by Apple.

Under certain conditions, Xsan volumes may not expand when you introduce new LUNs to an existing storage pool. Here's some background information and how to deal with the issue.

Bandwidth Expansion versus Storage Expansion

Adding LUNs to an existing storage pool will increase both the capacity of a volume as well as the amount of data you can write to a volume per unit of time, so adding LUNs to an existing storage pool known as "bandwidth expansion." (Note that this is true within reasonable limits. If you attempt to make a volume arbitrarily large, you will at some point encounter a diminishing return, and ultimately performance issues as you approach the limits of your equipment.)

Alternately, adding LUNs to a new storage pool will increase the capacity of a volume, but it will not increase bandwidth. Therefore, adding LUNs to an new storage pool is referred to as "storage expansion."

This article pertains to bandwidth expansion.

Issue description

Xsan 1.1 and earlier: After adding LUNs to an existing storage pool, Xsan volumes will no longer mount at Xsan clients.

Xsan 1.2 and later: After adding LUNs to an existing storage pool, changes made to the volume configuration will revert.

Solution

In each of the following steps, replace the phrase `<VolumeName>` with the name of your Xsan Volume, and replace the phrase `<PoolName>` with the name of the storage pool you want to expand. Also, after using the command sudo, authenticate if prompted.

Preparation:

If using multiple Metadata Controllers:

1. Determine which metadata controller (MDC) is controlling the volume by visiting the <VolumeName> Overview in Xsan Admin. Note which MDC is hosting the volume by referencing the "Hosted By" value. Perform the following steps on the computer that is hosting the volume.
2. If the MDC is running Xsan 1.1 or earlier, ensure that the Xsan volume will start up and mount. If the volume will not start or mount, then stop here and contact AppleCare for support. If the volume will start and mount, make a backup of the config file by issuing the following command in the Terminal:

   ```
   $ sudo cp /Library/Filesystems/Xsan/config/<VolumeName>.cfg /Library/Filesystems/Xsan/config/<VolumeName>.cfg.bak
   ```

3. Assess your site's needs. If you only wish to increase the volume's capacity, just add the LUNs to a new storage pool. If your site requires an increase in a volume's bandwidth, you will need to take the following steps:
   a. Unmount and stop the volume.
   b. Verify that there are no inconsistencies in the filesystem by following the steps described here.
   c. In Xsan Admin > Setup > LUNs, label the new LUNs.
   d. In Xsan Admin > Setup > Storage, drag the new LUNs from the "Available LUNs" drawer to the preexisting storage pool.
   e. Click Save.
   f. If the expansion failed, proceed to step 4.
4. Verify that the issue is occurring by reading the cvupdatefs log located in /var/run. To do so, type the following in the Terminal application located in /Applications/Utilities:

   ```
   $ sudo cat /var/run/xsan_cvupdatefs_<VolumeName>.log
   ```

   (Note that rebooting your MDC will result in this file being deleted.)

   If an Xsan volume is affected by this issue, you will see the following entry at the end of the file:

   ```
   <snip>

   Bitmap fragmentation threshold exceeded. Aborting. Invalid argument

   *Fatal*: Failed to expand stripe group

   Check configuration and try again

   <snip>
   ```

   What this means:

The addition of the LUNs to a pre-existing storage pool would have fragmented the storage pool so that performance would have been unacceptably slow.

Preparation for Workaround

1. If your MDC is running Xsan 1.2 and you're affected by the issue, skip to step 3.
2. If the MDC is running Xsan 1.1 of earlier, restore the backup of the volume config file by issuing the following commands in the Terminal:

```
$ sudo rm /Library/Filesystems/Xsan/config/<VolumeName>.cfg
$ sudo cp /Library/Filesystems/Xsan/config/<VolumeName>.cfg.bak /Library/Filesystems/Xsan/config/<VolumeName>.cfg
```

   Verify that the volume will start and mount. If it will not, stop here and contact AppleCare Support. If it will start and mount, continue to step 3.
3. Run cvfsck again to verify that there are no inconsistencies in the filesystem by following the steps described here.

Workaround

1. All data that resides on the storage pool will need to be temporarily backed-up to another volume in order to correct this issue.
   a. Start and mount the Xsan volume only on the Metadata controller.
   b. In the Terminal, type:

```
sudo cvfsck -x <VolumeName> | awk -F, '{print $5","$6}' | egrep -v "^none,"
```

   This command should produce a list of all folders at the root of the Xsan volume which have one or more files located on the Storage Pool that is listed before the folder name. For instance, in the following example the folder Affinity1 has one of more of it's files on the Storage Pool called "MyPool."

```
MyPool,Affinity1
```

   A Note about "cvfsck -x": This command only returns the first eight characters of a Storage Pool's name. For example, a storage pool with the name "VideoPool" would be changed to "VideoPoo."

   If you have two or more pools with names containing the same first 8 characters, cvfsck will change the name of the first of these Storage Pools listed in Xsan Admin > Setup > Storage to eight characters. For example, a pool named DataPoolMoe would be converted to "DataPool."

   Next, cvfsck will convert each subsequent pool encountered in the config settings located in Xsan Admin with the same first 8 characters to have a trailing numeric character. For instance, if there were two other storage Pools named DataPoolLarry and DataPoolCurly, cvfsck would convert these to DataPoo1 and DataPoo2. To determine which converted name corresponds to which pool, visit Xsan Admin > Setup > Storage and note in which order these storage pools are listed from top to bottom and correspond these to the numeric values.

2. After you have determined where you will temporarily back up the data, mount the temporary backup volume on the MDC.
3. Run the following command to back up each folder that resides on the storage pool you wish to expand:

```
$ sudo tar -czpf /Volumes/<TempVol>/<FolderName>.tgz -C/Volumes/<VolumeName>/ <FolderName>
```

   ...replacing <TempVol> with the name of the volume to which the data will be temporarily backed up, <FolderName> with the name of the folder which is to be backed up, and <VolumeName> with the name of the Xsan volume.
4. Verify that all files that reside on the storage pool have been backed up.
5. Verify that all backed up folders can be extracted and that the contents are identical to the originals.
6. Delete the folders that have been backed up from the Xsan volume.
7. Add the new LUN(s) to the existing storage pool as directed above.
8. Verify that the LUNs have successfully been incorporated into the storage pool.
9. Run cvfsck again to verify that there are no inconsistencies in the filesystem by following the steps described here.
10. Start and mount the Xsan volume.
11. Restore the backed-up files from the temporary backup location to the newly expanded filesystem:

```
$ sudo tar -xzf /Volumes/<TempVol>/<FolderName>.tgz-C /Volumes/<VolumeName>/
```

12. Verify that all restored folders and their contents are identical to the originals.
13. Delete the tar files from the temporary location.

Mac OS X 10.4, 10.5: Computer shuts down during Safe Boot

This article has been archived and is no longer updated by Apple.

When starting up with Safe Boot, a disk verification and repair happens automatically. In Mac OS X 10.4 or later, if the disk repair cannot repair issues on the disk, the computer will automatically shut down while a gray screen and Apple logo appear on the screen. This protects existing data on the drive. Even if you can start up without Safe Boot, you should address the disk issue as soon as possible.

You have three options if this happens:

- Start from your Mac OS X Tiger Install DVD and use Disk Utility to try to repair the drive. If repair is successful, you should be able to start up normally. If repair is not successful, consider the next two options.
- Back up your important data and files (as much as possible), then try using a third-party disk utility to repair the drive. Be sure that you use one that works with your version of Mac OS X. If this doesn't work, consider the next option.
- Back up your important data and files (as much as possible), then perform an Erase and Install installation of Mac OS X on the affected volume. **Important**: This option completely erases the destination volume and then installs a new copy of Mac OS X. You should always backup important files on the target volume before performing an Erase and Install installation. You can then restore your backed up files afterwards.

Aperture: Photoshop files do not appear in the Import window

This article has been archived and is no longer updated by Apple.

Sometimes, Photoshop files (PSD) do not show up in the Import window in Aperture.

This happens if there is a TIFF file with the same name at the same location; only the TIFF file will appear. One way to work around this issue is to simply drag the PSD file directly onto a project icon in the Project pane. Alternatively, you could rename one of the files before importing.

This document will be updated as more information becomes available.

Safari (Japanese): Add Bookmark command may not work

This article has been archived and is no longer updated by Apple.

Under certain circumstances, the Add Bookmark command may not work in Safari. This issue occurs when your primary system language is Japanese.

To resolve the issue, follow these steps:

1. From the **Bookmarks** menu in Safari, choose **Show All Bookmarks**.
2. Select the Bookmarks Bar collection.
3. Locate the folder with no name (just after Yahoo! Japan), and select this folder.
4. Press Delete to remove this empty folder.

Final Cut Pro: Unexpected timecode breaks encountered with Batch Capture

This article has been archived and is no longer updated by Apple.

In some instances, while batch capturing sequence clips, this alert message may appear:

> Batch capture encountered timecode breaks in sequence items. To protect your edits, these clips were left offline and not divided into separate clips.

This dialog usually indicates that Final Cut Pro encountered non-sequential timecode when attempting to capture a clip. The timecode break might have been in the clip itself, in the requested media handle sections, or in the pre-roll segment of the tape leading up to the clip.

If this dialogue appears, try to determine what actual segment of tape Final Cut Pro is trying to capture. Final Cut Pro must be able to detect continuously present and sequential timecode values, starting from the pre-roll section, through incoming handle, the clip itself from In to Out, and through to the end of the outgoing handle.

If the timecode break occurs in the handle or pre-roll areas, try making the pre-roll or the handle values smaller (if possible) while capturing that particular clip. If you discover that there is a timecode break in the clip itself, simply re-log the single clip as two clips that do not include the problem timecode segment (remembering to allow for handles and pre-roll).

In rare cases, you may find that the timecode on tape *seems* to be valid and sequential for the section of media being captured. In most of these instances, a slightly erratic timecode signal may have caused Final Cut Pro to detect a break where none appears to exist. If this happens, the batch capture for that clip can simply be attempted again. If a timecode break is reported repeatedly, there may be a marginal problem with the tape itself. In these cases, a good solution is to dub or clone the tape to a new tape with timecode intact.

If none of the suggestions above help you to capture successfully, then choose **Final Cut Pro > User Preferences**. Click the General tab. In the **On timecode break** pop-up menu, choose **Warn After Capture**. This will allow you to complete the capture without the dialog appearing, but the resulting captured media may contain problems that could propagate further into the project as editing progresses. For this reason, this last suggestion should be taken only if all else fails. Remember to reset the preference to either **Abort Capture** or **Make New Clip** before capturing any additional media.

For more detail on the terms and concepts discussed in this document, refer to the Final Cut Pro User Manual, available within Final Cut Pro, under the Help menu.

Aperture 1.0.1: Auto Level Adjustment does not work in Mac OS X 10.4.6

This article has been archived and is no longer updated by Apple.

When using Mac OS X 10.4.6 and Aperture 1.0.1, the Auto Level Adjustment buttons stop working properly for some images. For some affected images the button has no effect, while for others it adjusts the image improperly.

If this happens, you can still adjust manually.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Aperture: Some images render incorrectly when using Mac OS X 10.4.6

This article has been archived and is no longer updated by Apple.

When using Aperture 1.0.1 with Mac OS X 10.4.6, some images may exhibit noise, color banding, or posterization that did not appear when using Mac OS X 10.4.5.

This is a cosmetic issue, because it only affects images which are scaled to fit your screen or the Viewer. These artifacts will not appear when zoomed in to 100 percent, when using the loupe, exporting, or printing.

This issue is resolved in Aperture 1.1 or later.

iSync: Editing contact name on Motorola phone may create a duplicate Address Book entry

This article has been archived and is no longer updated by Apple.

Issue or symptom

Editing an existing contact on a Motorola phone may create duplicate Address Book entries. After creating a contact on your Motorola phone, then syncing, you later edit the contact name on the phone. On the next sync, the old contact name and new contact name may be displayed as separate contacts in Address Book (in Mac OS X).

Solution

To avoid this situation, edit existing contact names on the computer, not the phone.

To resolve duplicate entries, you can use the Merge Selected Cards feature in Address Book in Mac OS X before syncing again.

iSync 2.2 or later: Some phones may require a firmware update

This article has been archived and is no longer updated by Apple.

Issue or symptom

Attempting to add a supported phone to iSync using the **Add Device** choice in the **Devices** menu may cause this alert message to appear:

"Your phone (phonename) does not work with this version of iSync. To enable this phone to work with iSync, contact the phone's manufacturer or your service provider to update the firmware on your phone. For more information, visit the iSync Support website."

Solution

Update to the latest versions of Mac OS X and iSync via Software Update.

If the issue persists, check with your cell phone provider or manufacturer to see if a later firmware version is available for your phone.

Apple Remote Desktop 3: Repeated serial number requests, or "Your task server could not be contacted" message

This article has been archived and is no longer updated by Apple.

The first time you open the Remote Desktop 3.0 admin application, you should be logged in as an admin user. If not, you will see one of these two symptoms every time you launch the application:

- a request to enter your product serial number
- this message: "Your task server, ' ', could not be contacted."

To resolve the issue, log in as an admin user, open Remote Desktop, complete the setup steps, and quit.

Published Date: Feb 20, 2012

Apple Remote Desktop 3: First launch dialog causes a "Copy and Open" or Open Items task to fail

This article has been archived and is no longer updated by Apple.

If the first launch dialog is present on an ARD client, a "Copy and Open" or Open Items task may fail.

The reason this happens is that when an application is launched for the first time, Mac OS X asks the user to confirm opening it for the first time as a security measure.

After the confirmation dialog appears, opening a file that uses this application will succeed when the user confirms by clicking the Open button within a specified amount of time.

If that doesn't happen soon enough, the task will eventually time out with this message:

> "A communication failure occurred with this computer."

Mac OS X: FileVault-protected Home shows less capacity than what‘s available on the hard disk

This article has been archived and is no longer updated by Apple.

If you move (or migrate) a FileVault-protected account (home directory) to a Mac that has more hard disk capacity, the space available within the protected account will be less than the actual space available on the hard disk. FileVault is a feature of Mac OS X 10.3 or later.

To make more space available for the protected account, follow these steps:

Tip: Back up the contents of your Home before starting the process—if security is a concern, create an encrypted disk image on your destination volume and copy files to it. You can choose **Home** from the Finder's **Go** menu to see all the stuff in your Home.

1. Log in as the account user.
2. Use Security preferences to turn off File Vault (you will be logged out during the process).
3. Log in with the account again.
4. Use Security preferences to turn FileVault back on (you will be logged out during the process).

As Security preferences states, turning FileVault off and back on may take a while, depending on the size of your Home.

Tip: If you do not have sufficient free space on your hard disk, you will need to temporarily reduce the size of your home directory, for example by copying a large amount of data in your home directory to an external hard disk, then deleting the stuff that you moved from your Home. After copying, log out or restart so that FileVault can reclaim the unused space.

Why does this happen?

When FileVault is enabled, the stuff in your Home, such as desktop contents, documents, and account preferences, are transferred to an AES-128 bit encrypted sparse disk image. A sparse disk image is one that grows in size as you copy more data to it. "Traditional" disk images (non-sparse images) are a set size no matter how much stuff is or isn't on them. In other words, a traditional disk image of 2 GB will always be 2 GB in size even with no data in it—a sparse image will be only as large as the data contained in it.

However, the *maximum* size of a sparse image is established when the image is created. Of course, the maximum image size can't exceed your available hard disk space, so if you migrate the account from a Mac with a smaller-sized hard disk, the FileVault sparse disk image's size will always be limited by the size of your former Mac's available space, unless you follow the above steps to create a new FileVault image.

iChat: Audio or video connection does not end when you go offline or log out of AIM, Jabber, or Bonjour

This article has been archived and is no longer updated by Apple.

After an audio or video conference in iChat, your audio or video continues to be sent to the person you were chatting with if you log out of iChat or set your iChat status to Offline. This can happen when chatting via voice or video with a buddy from your AIM, Bonjour, or Jabber buddy lists.

Solution: Close the chat window, or quit iChat, to stop transmitting audio or video to your buddy.

Additional information

This happens because iChat establishes a direct peer-to-peer (or peers) network connection for audio or video chats. Once the direct connection is established, audio and/or video sessions continue even if you log off of your AIM, Bonjour or Jabber services.

Aperture 1.1: "Configuration warning" alert when using with Mac OS X 10.4.5 or earlier

This article has been archived and is no longer updated by Apple.

Aperture 1.1 works with Mac OS X 10.4.6 or later. If you try to run Aperture 1.1 with Mac OS X 10.4.5 or earlier, this alert message appears:

> "**Configuration warning**
> This software requires certain hardware or software which is missing.
> • Mac OS X 10.4.6 or higher."

Solution

1. On Intel-based Macs, two buttons appear in the alert, "OK" and "Quit". Click Quit. Do not click OK.

   On PowerPC-based Macs, a Quit button appears in the alert. Click Quit.

2. Update to Mac OS X 10.4.6 or later
3. Open Aperture 1.1.

Xsan volume may not mount after using Xsan 1.3 uninstaller

This article has been archived and is no longer updated by Apple.

If you use the Xsan 1.3 uninstaller and then reinstall an older version, such as Xsan 1.1 or 1.2, on the same computer, the Xsan volumes may not mount on startup. Xsan Admin will show that the volume is mounted, but it will not appear in the Finder. Relaunching the Finder via the Force Quit dialog may allow the volume to mount until the computer is restarted.

To resolve the issue, follow these steps:

1. Use the Xsan uninstaller to remove Xsan from the system.
2. Delete this file from the startup disk:

   ```
   /System/Library/Extensions/AppleXsanFilter.kext
   ```

3. Install Xsan 1.1, then update to the desired version.

What is the wattage specification for iPod Hi-Fi?

This article has been archived and is no longer updated by Apple.

What is the wattage specification for iPod Hi-Fi?

Apple does not specifying the wattage rating of the output volume on the iPod Hi-Fi. A wattage rating only specifies how much potential power is available to the amplifier and speakers. Amplifiers and speaker drivers are never (and sometimes not even close to) 100% efficient. Instead of reporting the starting or potential power, Apple states the maximum peak sound pressure level (SPL) which is the final output, or end result of that power. A wattage specification is not a reliable means to determine sound volume. A very efficient 20-watt system is theoretically capable of playing just as loudly as a very inefficient 80-watt system.

The iPod Hi-Fi performance specifications are:

- Frequency response: 53Hz to 16kHz plus or minus 3 dB
- Maximum peak sound pressure level: 108 dB at 1 m (AC); 102 dB at 1 m (DC)

Mac OS X: Low battery alert does not appear over full-screen application, keyboard becomes unresponsive

This article has been archived and is no longer updated by Apple.

If your battery gets low when using an application that fills the entire display on a portable Mac (that is, the Mac OS X menu bar is not visible), you will not see the low battery alert warning. This article applies to Mac OS X 10.2 or later on an iBook, PowerBook, or MacBook Pro computer.

When this happens, your built-in keyboard and trackpad may become unresponsive.

Solution

Simply connect your computer to an AC outlet to recharge the battery. If your AC adapter is not handy, connect an external keyboard and mouse to your computer to see and dismiss the low battery alert (after which your built-in keyboard will work).

About the security content of J2SE 5.0 Release 4

This article has been archived and is no longer updated by Apple.

This document describes the security content of J2SE 5.0 Release 4, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, visit the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to Use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerability for further information.

To learn about other Security Updates, see "Apple Security Updates."

J2SE 5.0 Release 4

- **Java**

  CVE-ID: CVE-2006-0613

  Available for: Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Untrusted Java applications may obtain elevated privileges.

  Description: A security vulnerability in Java Web Start may allow an untrusted application to elevate its privileges. This update addresses the issue by providing J2SE version 1.5.0_06, which is not susceptible to this vulnerability. For additional information on this issue see Sun Alert 102170 (http://sunsolve.sun.com/search/document.do?assetkey=1-26-102170-1)

- **Java**

  CVE-ID: CVE-2006-0614, CVE-2006-0615, CVE-2006-0616, CVE-2006-0617

  Available for: Mac OS X v10.4.5, Mac OS X Server v10.4.5

  Impact: Untrusted Java applets may obtain elevated privileges.

  Description: Security vulnerabilities related to the use of "reflection" APIs in the Java Runtime Environment may allow an untrusted applet to elevate its privileges. This update addresses these issues by providing J2SE version 1.5.0_06, which is not susceptible to these vulnerabilities. For additional information on these issues see Sun Alert 102171 (http://sunsolve.sun.com/search/document.do?assetkey=1-26-102171-1)

Additionally, a minor security-related fix is included in this update for Java InputMethods. Due to an issue handling input method events, it is possible that key events intended for a secure field such as a password field may be sent to a normal text field in the same window. This could result in accidental password disclosure to others present when the password is entered. This update addresses the problem by properly handling input method events. Credit to Misako Ishida from SAP AG for reporting this issue.

Intel-based Macs: Compatibility with Gigabit Ethernet switches

This article has been archived and is no longer updated by Apple.

Some Gigabit Ethernet switches, using early versions of Broadcom 1000BASE-T PHY (Broadcom 5400), were manufactured and shipped before the IEEE 802.3ab specification was finalized and they do not comply with the final specification. These switches are not compatible with Intel-based Macintosh computers using the 1000BaseT setting.

Intel-based Macintosh computers will detect a link with some non-compliant switches, but can't interoperate with the switches at the 1000BaseT speed setting. You can change the settings on the Intel-based Mac to operate with these switches at the 100BaseTX setting instead.

To change the speed setting:

1. From the **Apple** menu, select **System Preferences...**
2. Select the Network pane.
3. Highlight the Built-in Ethernet line and click the Configure... button.
4. Select the Ethernet tab.
5. Change the Configure: drop-down menu to **Manually (Advanced)**.
6. Change the Speed: drop-down menu to **100baseTX**.
7. Click the Apply Now button.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iWeb: Hit counter must be positioned completely within the canvas

This article has been archived and is no longer updated by Apple.

In your iWeb project, make certain that the entire hit counter is positioned within the canvas page prior to publishing.

If the hit counter isn't positioned completely within the canvas (1), then it may appear split in half or only partially visible when viewed with a browser (2).

Note: The hit counter works only if you publish your site to .Mac.

Published Date: Feb 20, 2012

iWeb: Publishing your site to servers other than .Mac may cause text anomalies

This article has been archived and is no longer updated by Apple.

If you publish your iWeb site via FTP to a web host other than .Mac, some characters may appear incorrectly when viewed in a browser. For example, some characters may show up as question marks.

This can happen when an FTP program misinterprets characters on your webpage. Because FTP programs and host servers don't always adhere to the same standards, changing your FTP and/or host server preferences to use UTF-8 text encoding may resolve this issue (iWeb uses UTF-8 text encoding).

If that does not help, check the support documentation provided by your Internet service provider or web host to learn how to change applicable settings on the host server.

iWeb: Deleting lists on the About Me page provides different results with different templates

This article has been archived and is no longer updated by Apple.

In iWeb, when you add an About Me page to some of the templates and delete one or more lists on the page, the complete list is not always deleted. This table illustrates the results of deleting lists in an About Me page:

Template	Example	Description
Pavement		
Formal		Numbers are left behind, but the next column section won't start with a number 1.
Black		
Portfolio		All bullets are removed.
Journal		Bullets and numbers are removed.
White		All numbers are removed.

As a workaround, use the Inspector to modify the list.

1. Select the list.
2. If the Text Inspector isn't open, click Inspector in the toolbar (or choose **View > Show Inspector**), and then click the Text Inspector button.
3. If the List pane isn't showing, click List
4. Configure the list using the options as needed in the List inspector.

This document will be updated as more information becomes available.

Aperture 1.1 Update: What to do when it won‘t install over version 1.0.1

This article has been archived and is no longer updated by Apple.

Under certain circumstances, the Aperture 1.1 Update won't install on Aperture 1.0.1 as intended. When this happens, Software Update won't offer you Aperture 1.1, and/or the standalone Aperture 1.1 updater says that no eligible previous version was found.

To resolve this issue, simply reapply the Aperture 1.0.1 update before using 1.1 again. You can get Aperture 1.0.1 using Software Update or Apple Downloads.

iWeb: Clear web browser cache when testing changes to your site

This article has been archived and is no longer updated by Apple.

If you republish a page and it looks different in the browser than it did in iWeb, try clearing your browser cache. Otherwise, you may notice things like missing media, or objects (such as text) from your old page that still appear on the new version of the page.

To clear the cache in Safari:

1. Open Safari.
2. From the **Safari** menu, choose **Empty Cache** (Safari > Empty Cache).
3. In the warning dialog that appears, click on Empty.
4. Visit your site again (by clicking the Visit button in iWeb) or reload the page in Safari.

If you use a different browser, check the browser's Help or other documentation to see how to clear the cache.

This document will be updated as more information becomes available.

Xsan 1.3: Do not use Disk Utility in Mac OS X 10.4.5 to edit Xsan volumes

This article has been archived and is no longer updated by Apple.

If you are running Xsan 1.3 on Mac OS X 10.4.5, Disk Utility will display Xsan volumes as unknown GPT partitions and will let you edit them.

Warning: Despite the fact that Disk Utility will allow it, you must not use Disk Utility to edit these volumes in Mac OS X 10.4.5, because doing so may cause data loss.

To avoid this risk, update your Xsan clients to Mac OS X 10.4.6 or later.

Using Disk Utility in Mac OS X 10.4.6 and later to edit Xsan volumes will not put data at risk, but in general you should use Xsan tools instead. Use Xsan Admin to label Xsan volumes, cvfsck to repair Xsan volumes, and Raid Admin to rebuild arrays.

Published Date: Oct 7, 2016

iWeb: Publish all after changing names of linked pages in the Inspector

This article has been archived and is no longer updated by Apple.

If you change the name of a site or page in the Inspector, any links to that site or page on your other iWeb sites will no longer work. Links to a site can also break if you publish the site to .Mac and then republish it to a .Mac group.

To change site or page names without breaking links, do one of the following:

- Use the site organizer to rename a site or webpage.
- Hold down the Option key and choose **Publish All to .Mac** from the **File** menu (**File** > **Publish All to .Mac**) after making your changes.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Mac OS: What is a .smi File

This article describes a Self Mounting Image file. These files have filenames ending with the .smi suffix.
This article has been archived and is no longer updated by Apple.
.smi is a self-mounting image. It is a Disk Copy image for which you do not need the Disk Copy program.

When you double-click a .smi file, the image mounts on the desktop and an icon will appear. At this time, there is no public software for making .smi files.

Mobile Users sync every 20 minutes after disabling sync settings

This article has been archived and is no longer updated by Apple.

Mobile users sync every 20 minutes after choosing to manage the background sync settings as Never.

When you stop managing the background sync settings for mobile users in Workgroup Manager by choosing Never, it's important to understand that this does not mean syncing will stop altogether. Rather, it means that clients will no longer use the settings specified in Workgroup Manager.

Instead, they will revert to the user's settings, which are to sync every 20 minutes in the background by default. If you want to stop the mobile users from syncing their portable home directories in the background, manage the Background Sync settings as Always, and remove everything from the Include list.

This document describes Mac OS X Server 10.4 or later when used with Mac OS X 10.4 or later clients.

Published Date: Feb 20, 2012

Xsan 1.3 and Later: LUNs with capacity larger than 2.0TB may appear as being 2.0TB in size.

This article has been archived and is no longer updated by Apple.

Prior to Xsan 1.3, LUNs with actual capacity greater than 2.0TB that have been incorporated into ACFS volumes appear as 2.0TB and are limited to that amount of use, an automatically imposed limit known as "truncation." Xsan 1.3 supports LUNs larger than 2.0TB, but LUNs truncated under previous versions of Xsan will remain truncated.

After updating to Xsan 1.3, you can reclaim the drive space on truncated LUNs by erasing the LUN.

Warning: Erasing a LUN will destroy the data on the LUN which will, in turn, destroy the data on an Xsan volume that incorporates the LUN. Therefore, you must back up all data on the Xsan volume and then delete the Xsan volume before erasing the LUN.

Follow these steps:

Note: If you have a LUN that has been truncated to 2TB and is not part of a volume, you can skip straight to step 8.

1. Back up all data on the Xsan volume.
2. Unmount the volume from all machines.
3. Stop the volume.
4. In Xsan Admin 1.3, choose **Setup > Storage**.
5. Select the Xsan volume, and click the "-" button to delete the volume.
6. Click Save, and then choose the option to Delete.
7. In Xsan Admin 1.3, choose **Setup > LUNs**.
8. Select the LUN that needs to be erased, and click the Edit button.
9. Delete the text in the Label field, then click OK.
10. In Xsan Admin 1.3, choose **Setup > LUNs**. The LUN which was unlabeled will now appear as "Unlabeled."
11. Select the LUN, and click edit.
12. Enter a LUN name, check the box "Allow LUN to exceed 2 TB capacity," and save it.

The LUN will now use the full capacity of its storage.

Mac OS X 10.4.6: Applications silently fail to open, or you see "error: can‘t fragload"

This article has been archived and is no longer updated by Apple.

After installing the smaller-sized delta (or "patch") version of the Mac OS X 10.4.6 Update on a PowerPC-based Mac, a few applications may:

- Fail to open, without an alert message, **or**
- Display the alert message "error: can't fragload", **or**
- "err -2804" messages appear in the Console log.

Note: If you want to see if you installed the smaller-sized delta version of the Mac OS X 10.4.6 Update, see this article and look for a MacOSXUpd10.4.6PPCPatch.pkg file in your Receipts folder. If you don't have this "PPCPatch" file, this article does not apply to you. Note that not all delta updates are smaller-sized deltas.

Solution

Do either of the following:

- Download and install "Mac OS X 10.4.6 Combo for PPC," which is about 140 MB in size. If you are updating more than one PowerPC-based Mac, you'll probably want to use this download.

- Or, if you want a smaller download, download and install "Mac OS X 10.4.6 for PPC," which is about 65 MB is size.

Note: These updates do not appear via Software Update preferences once you've already installed the smaller-sized Mac OS X 10.4.6 Update. You must manually download and install them from Apple Downloads as linked above.

Soundtrack Pro sometimes doesn‘t open on MacBook Pro (17-inch)

This article has been archived and is no longer updated by Apple.

Symptom

Soundtrack Pro may not open on your MacBook Pro (17-inch).

Solution

Use Software Update to update to Mac OS X 10.4.7 or later to resolve this issue.

Published Date: Oct 7, 2016

iMovie HD 6 and iMovie ‘08 require Quartz Extreme-compatible graphics cards

This article has been archived and is no longer updated by Apple.

iMovie HD 6 and iMovie '08 include features which require Quartz Extreme. Quartz Extreme is a technology included with Mac OS X that utilizes advanced visual capabilities offered by modern graphics cards.

If you install an additional graphics card that is not compatible with Quartz Extreme in your computer (so that you can attach another display), the features listed above may not function correctly in iMovie. This is true even if your original built-in graphics card is Quartz-Extreme compatible. The additional card must be compatible with Quartz Extreme, even if you will not be displaying your iMovie project windows on the display connected to it.

iMovie requires that **all** graphics cards in the computer be compatible with Quartz Extreme. Note that Quartz Extreme requires millions of colors.

See Mac OS X 10.4: Requirements for Quartz Extreme and Core Image graphics for information on how to tell if you have Quartz Extreme functionality.

Note: With iMovie 6.0.2 and later, when you open iMovie with non-Quartz Extreme compatible graphics hardware, you'll get an alert message that says:

> "Your computer contains a graphics card which may not support iMovie. iMovie requires a 'Quartz Extreme Compatible' graphics card. Certain iMovie features such as Themes, Ken Burns Photos, and Video FX may not work properly with your graphics card."

About the Mac OS X Server 10.4.7 Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server 10.4.6 to version 10.4.7.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.7. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.7: Use Software Update or install from a standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Note: Do not use the "Download Only" or "Install and Keep Package" options in Software Update. The resulting download will not install on your server. If you need a standalone installer, follow the instructions in the next section.

Standalone Installer

A standalone installer is also available from Apple Downloads. The Mac OS X Server 10.4.7 Update specifically updates version 10.4.6 to version 10.4.7. There is also a "Combo Update" installer available, which will update any version of Mac OS X Server 10.4 to 10.4.7.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Improvements

Apple File Services (Server)

- Addresses an issue that could cause the AppleFileServer process to stop responding and disconnect users.
- The Apple File Service will now start if sharepoints are locked.
- Permissions are now correctly handled for Active Directory users on third-party NFS exports which are reshared via AFP.

Apple File Services (Client)

- Prevents issues in which certain Adobe and Quark applications unexpectedly quit when saving a file to a non-Apple AFP server.
- Addresses an issue that could cause files to be deleted when duplicating them in the Finder on a mounted AFP volume.
- Addresses an issue that could cause the error "Bad file descriptor" when using the cp command to copy a file to an AFP volume.

Command-Line Tools

- The changeip command now updates Kerberos credentials when run on a server bound to a Kerberos realm.
- Improves reliability of the lsof command on systems with large amounts of RAM installed.
- Fixes a rare problem that could prevent incoming ssh connections.

Disk Utility

- Improves reliability of rebuilding a degraded RAID 1 (mirror) set in Disk Utility.

Mail Server

- Updates ClamAV to version 0.88.2 for virus filtering and security.

MySQL

- Updates the default MySQL configuration file (/etc/my.cnf) to improve MySQL performance.

Netboot/Netinstall

- Added model properties for MacBook and 17-inch MacBook Pro.

Networking

- Mac OS X 10.4 computers will now respond to Layer 2 Multicast ARPs.

NFS Server

- Increases the maximum number of NFS server daemons configurable in Server Admin from 20 to 64.
- Fixes an issue that would prevent clients from mounting NFS shares if the root volume (/) was exported with the "-alldirs" option.
- Improves reliability of exporting directories that may not mount early in the startup process, such as volumes on an Xserve RAID.

Password Server

- Addresses an issue that prevented ApplePasswordServer.Server.log from rolling.

SMB Server

- Resolves an issue that prevented Windows 95, 98, and ME clients from connecting to the SMB Server in Mac OS Server X 10.4.6.

Xsan-related Improvements

- Resolves an issue which could cause Xsan clients to stop responding when accessing the SAN if an Xsan peer was rebooted.
- Increases the maximum number of vnodes on systems with 2GB or more RAM, to avoid a problem that could cause Xsan clients to become unresponsive when the vnode table became full.
- Resolves a problem using "Save As..." from certain Adobe applications to an Xsan volume reshared via AFP.
- The cp, mv and tar commands now pre-allocate space on Xsan volumes to avoid file fragmentation.

About the Mac OS X Server 10.4.7 Update (Combo)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server versions 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, and 10.4.6 to Mac OS X Server 10.4.7. It is a "combo" update that combines enhancements delivered with versions 10.4.1 through 10.4.7. If you already have Mac OS X Server 10.4.6, you can download a smaller update to update to version 10.4.7.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.7. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.7: Use Software Update or install from the standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Note: This version of Mac OS X Server is built as a multi-package and should not be used with Software Update's "Download Only" and "Install and Keep Package" options. If you need to save these packages for later use, try the manual update instead.

Standalone Installer

A standalone installer is also available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Enhancements delivered with this update

This update delivers many enhancements. Because this is a combo update, it includes enhancements that are delivered with the prior 10.4.x updates. You can see the individual enhancement lists for 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, and 10.4.7 updates.

Unable to drag and drop in Disk Utility while started from install DVD

This article has been archived and is no longer updated by Apple.

When you use the restore option in Disk Utility in Mac OS X 10.3 through 10.4.11, you have to drag the destination device into the destination field. If your Mac is started up from the install DVD that was included in the box with the computer, this drag-and-drop function may not be available, and you may not be able to use the restore process.

There are two possible workarounds to this issue:

- Start up from an external Firewire drive running Mac OS X and use Disk Utility while running off the Firewire drive.
- Start the Intel-based Mac up in Target Disk mode and connect the Mac to another computer running Mac OS X (version 10.4 or later). Then use Disk Utility on the host computer to backup and restore the drives.

Published Date: Oct 7, 2016

Mac OS X Server 10.4: Third-party clients cannot see contents of NFS export

This article has been archived and is no longer updated by Apple.

HFS Plus file systems exported by Mac OS 10.4 and later use 64-bit values in the NFSv3 READDIR cookies. Some clients running non-Apple operating systems may only be able to handle 32-bit values in the NFSv3 64-bit READDIR cookies. These clients will not see the full contents of NFS shares exported by a Mac OS X 10.4 Server.

To resolve the issue, use one of these two solutions:

- Export the NFS directory using the "-32bitclients" option. **Note:** This requires Mac OS X Server 10.4.3 or later.

  – Or –

- Have the client OS access the share using NFSv2 (which only has 32-bit READDIR cookies) instead of NFSv3.

Published Date: Oct 7, 2016

Mac OS X Server 10.4.6: Changes in server hostname discovery

This article has been archived and is no longer updated by Apple.

Mac OS X Server 10.4.6 improves server hostname discovery and error reporting. This article summarizes the changes.

Automatic hostname storage

The hostname will automatically be stored to System Configuration the first time it is detected via a DNS lookup.

- servermgrd will attempt to look up the hostname of the server in DNS based on its primary IP address, when the hostname has not been set. If it finds a name, it will store that name in System Configuration.
- This prevents the host booting with a ".local" name when the network is not up in time or there is boot timing issue due to switch latencies, and so forth.
- `/var/log/system.log` will have entries that servermgrd has set the hostname and what it has set it to the first time it is detected.
- `/var/log/system.log` will denote that the names of the host and DNS are "synchronized," meaning, everything is ok.

Leave hostconfig alone

You should **not** modify the configuration file `/etc/hostconfig`, meaning you should leave hostname set as "-AUTOMATIC-".

Getting in the zone

If you configure a server as a DNS server for the first time, and it does not have a valid DNS name, the hostname will also be automatically set when the DNS zone is created.

Tastier logs

Various error messages now get logged to `/var/log/system.log` when the configured hostname and DNS do not match, warning you that things will not work correctly until fixed. Hostname checks occur periodically, you'll be reminded. Here's some sample system.log messages for reference:

DNS/configured name mismatch:

```
===== Apr 5 15:30:50 server3 servermgrd: servermgr_dns: configured name and reverse DNS name do not match (server3.testzone.com != nameserver.testzone.com), various services may not function properly - use changeip to repair and/or correct DNS
```

Synchronized message:

```
===== Apr 5 15:37:58 nameserver servermgrd: servermgr_dns: hostname and DNS entries for this server are synchronized
```

First boot, hostname set:

```
==== Apr 5 15:40:23 server2 servermgrd: servermgr_dns: hostname has been set to nameserver.testzone.com in SystemConfiguration - use changeip to change Apr 5 15:40:24 server2 servermgrd: servermgr_dns: hostname and DNS entries for this server are synchronized
```

For general information about using the changeip tool to change your server hostname or IP address see the Mac OS X Server Command-Line Administration Guide on the server documentation page, or type `man changeip` in Terminal.

For more information about changes to the the changeip tool in Mac OS X Server 10.4.6, see "changeip now requires fully qualified domain names."

Remote Desktop stops responding at the Task Server pane of the Setup Assistant

This article has been archived and is no longer updated by Apple.

If you have previously configured a Remote Desktop 2.2 computer as a remote task server for data collection, then Remote Desktop 3 may stop responding ("hang") at the Task Server pane of the Setup Assistant, or it may display the status of "--" for all client computers.

To resolve the issue, you can update the remote task server to Remote Desktop 3 as well, or select a task server that already has Remote Desktop 3 installed, or use the local system as the task server. To use the local system as the task server:

1. Quit or, if necessary, Force Quit the Remote Desktop application.
2. While holding Option key, open Remote Desktop. This will force the first-run assistant to appear.
3. Click through the first two screens to reach the screen where you specify the Task Server.
4. Specify a Task Server with Remote Desktop 3 installed, or choose to use the local computer as the task server.

If that does not resolve your issue, do this:

1. Quit the Remote Desktop application.
2. In the Sharing pane of System Preferences, turn off Apple Remote Desktop in the list of sharing services.
3. Move this file to the desktop:

   ```
   /Library/Preferences/com.apple.RemoteDesktop.plist
   ```

4. Turn on Apple Remote Desktop in the Sharing pane of System Preferences.
5. Open the Remote Desktop application, and specify a Task Server with Remote Desktop 3 installed, or choose to use the local computer as the task server.

iDVD: Keyboard Shortcuts fail to open from Help menu in Mac OS X 10.3.9

This article has been archived and is no longer updated by Apple.

In iDVD you can access a list of keyboard shortcuts by choosing iDVD Shortcuts from the Help menu. If you are using iDVD 5 or 6 with Mac OS X 10.3.9, choosing this menu item will open a blank page.

To access the keyboard shortcuts, try one of the following workarounds:

Search for keyboard shortcuts

1. Open iDVD.
2. From the Help menu, choose **iDVD Help**.
3. Type `keyboard shortcuts` into the search field (ask a question).
4. Double-click the Keyboard shortcuts item (or select it and click the Show button).

Go through Contents

1. Open iDVD.
2. From the **Help** menu, choose **iDVD** Help.
3. Click on the Contents link.
4. Click on the Shortcuts and tips link
5. Click on Keyboard shortcuts

Note: This issue does not occur with Mac OS X 10.4.x.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Final Cut Pro: Capture fails if more than one Ensemble audio device is connected

This article has been archived and is no longer updated by Apple.

If multiple Apogee Ensemble FireWire audio devices are connected to your computer (aggregated or not), capturing in Final Cut Pro may fail with this message:

> **This operation could not be completed as there is no video.**

When this happens, you may also notice the tape in the camera running and playing back to an external monitor as usual, but the playback doesn't show up in the Preview window.

As a workaround, you can turn off or disconnect one of the Ensemble devices while capturing. This will allow Final Cut Pro to allocate enough isochronous bandwidth to capture via FireWire.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Final Cut Pro: Set the time and date on your camera before shooting video

This article has been archived and is no longer updated by Apple.

Setting the time and date on your camera is important. Some of Final Cut Pro's features require time and date information on the tape in order to function reliably. For instance, if you're capturing DV or HDV using scene break detection, it's important to set the camera's clock before shooting video.

For best results, shoot your video after setting a date and time on your camera's clock. If you've already shot your video, you might find that automatic scene break detection doesn't behave reliably. If this occurs, simply log your clips before capturing, or use the controls in Capture Now to place scene breaks as desired.

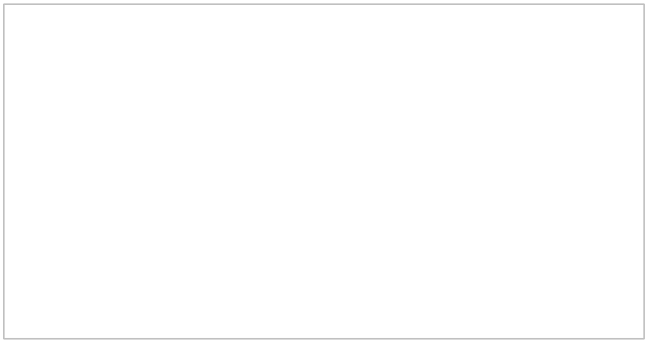
Update to iOS 12

Enjoy a faster and more responsive experience as well as fun new features, like Memoji and Camera Effects.

Get iOS 12



Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

Pro Applications Update 2006-01

This article has been archived and is no longer updated by Apple.

Pro Applications Update 2006-01 address several issues with underlying frameworks and shared components for the following professional applications, and is strongly recommended for all users of Final Cut Studio 5.1, Final Cut Pro 5.1, Motion 2.1, Soundtrack Pro 1.1, Apple Qmaster 2.1, Compressor 2.1, DVD Studio Pro 4.1, LiveType 2.1, Shake 4.1, and Final Cut Express HD 3.5.

Pro Application Update 2006-01 updates the following components

HDVCodec

HDVCodec addresses compatibility issues with Sony's XDCAM-HD 1080p24 25 Mbps CBR format and playback for the XDCAM-HD 540-line VFR formats.

This update is required for customers using Final Cut Pro 5.1.1 and the "Cine Alta" filmmaker features of Sony's XDCAM-HD cameras.

Uncompressed 422

Uncompressed 422 delivers a fix for changes in color-space and/or gamma when moving clips between Final Cut Pro and Adobe After Effects and addresses a codec issue leading to drawing errors in 16bpc After Effects projects. It also fixes discrepancies found between former AltiVec and the current Intel (scalar) code and delivers some performance improvements on Intel-based Macs.

This update is required for customers using Final Cut Pro 5.1 and recommended for customers using any of the Final Cut Studio 5.1 applications and Shake 4.1.

IMXCodec

IMXCodec delivers a fix for ARGB encoding on Intel-based Macs.

This update is required for customers using Shake 4.1 and recommended for Final Cut Studio 5.1 customers.

LiveType Support

This fix improves application stability when doing round-trip edits between Final Cut Pro and LiveType or Final Cut Express and LiveType. This also addresses an issue where LiveType could cause OverTheEdge's Unity to stop responding.

This update is required for customers using Final Cut Pro 5.1 and Final Cut Express HD 3.5.

FxPlug

FxPlug delivers a single image-processing plug-in architecture for pro applications.

This update is required for customers using Motion 2.1

Requirements for the Pro Applications Update 2006-01

- Mac OS X 10.4.4 or later
- QuickTime 7.0.4 or later

iDVD 6: Slideshow from iPhoto album only plays first slide

This article has been archived and is no longer updated by Apple.

If you add a slideshow to iDVD by selecting an album in iPhoto, by choosing **Send to iDVD** from the **Share** menu, then you may experience an issue where the slideshow appears to be "stuck" on the first slide when you preview your project.

If this happens, try the following steps:

1. In the iDVD window, double click on the slideshow to open the slideshow editor.
2. From the **Slide Duration** pop-up menu, choose a different option.
3. From the **Slide Duration** pop-up menu, choose the original setting (or the setting of your choice).
4. Preview the slideshow.

This document will be updated as more information becomes available.

Mac OS X 10.4: Network Time clients lose synchronization

This article has been archived and is no longer updated by Apple.

Some Mac OS X computers will lose time synchronization even when the "Set date & time automatically" option is selected in the Date & Time preference pane. To temporarily resolve the issue, simply deselect and then reselect that checkbox.

To permanently resolve the issue, you can modify the default values in the time synchronization configuration file. The defaults require several hours of constant access to the time server in order to establish synchronization. If the initial sync gets interrupted (by the computer going to sleep, for example), the subsequent synchronization will not take place, causing the computer to eventually drift from the correct time.

Note: Modification of the configuration file is an advanced technique. If you are not experienced in the type of steps you see below, consider using the temporary method mentioned above. The advanced steps will use the pico text editor as an example; advanced users may choose a different editor.

To modify the configuration file, follow these steps:

1. Be sure you are logged into Mac OS X with an administrator account.
2. Open the Terminal (located at /Applications/Utilities/).
3. Execute this command:

   ```
   sudo cp /etc/ntp.conf /etc/newntp.conf
   ```

4. When prompted, enter your administrator password.
5. Execute this command:

   ```
   sudo pico /etc/newntp.conf
   ```

6. Use the cursor keys lot locate the minpoll and maxpoll values, and then delete them.
7. Add "iburst" after the server address(es). Your edited file should contain an entry that looks like this:

   ```
   server time.apple.com iburst
   ```

8. Press Control-O followed by Return to save the file, then Control-X to exit pico.
9. Execute this command:

   ```
   sudo pico /System/Library/StartupItems/NetworkTime/NetworkTime
   ```

10. Change the line near the end of this file, which starts with "ntpd -f", so that it reads:

    ```
    ntpd -f /var/run/ntp.drift -p /var/run/ntpd.pid -c /etc/newntp.conf
    ```

11. Press Control-O followed by Return to save the file, then Control-X to exit pico.
12. To restart the Network Time service, execute this command:

    ```
    sudo SystemStarter -d restart "Network Time"
    ```

Note: These changes will help Mac OS X establish time synchronization quickly. Time drift may still occur if the computer's network configuration changes. To re-establish synchronization, restart the Network Time service as described in the last step above.

Mac OS X 10.4: Can‘t bind to a Directory Service with hyphen in computer name

This article has been archived and is no longer updated by Apple.

You may not be able to join, or bind to, a Directory Domain such as LDAP or Active Directory if your computer name contains a hyphen.

To allow binding, use a computer name that does not contain a hyphen.

Logic: Some languages appear twice in Finder Info window

This article has been archived and is no longer updated by Apple.

After updating Logic Pro/Express, one or more languages are duplicated in the Info window for Logic (the window that appears if you select Logic in the Finder then choose **File > Get Info**).

Solution

This happens if you have disabled one or more languages in the Info window before updating Logic. To prevent the issue, make sure all languages are enabled before updating. If you have already updated and have the issue, use these steps to resolve it:

1. Go to your Applications folder.
2. Drag the Logic Pro or Logic Express application to the Trash.
3. Still in the Finder, choose **Go > Home**.
4. Open the Library folder, then the Receipts folder inside it.
5. Drag any Logic Pro or Logic Express receipts to the Trash.
6. Reinstall Logic Pro (or Logic Express) from the installation DVD. It is sufficient to do a custom install and simply install the Logic application.
7. Update to the latest version of Logic.

If you wish to disable languages, that's OK, but be sure to re-enable them before future updates.

Aperture: CPU usage higher after switch to version 1.1 RAW decoding

This article has been archived and is no longer updated by Apple.

A system can become slow or unresponsive after migrating images from version 1.0 to 1.1 RAW decoding in Aperture. If you look at Activity Monitor, it shows Aperture using a large amount of CPU resources.

Solution

After you update images from 1.0 to 1.1 decoding, Aperture must regenerate each image thumbnail. If you update a large number of images at once, this can cause a noticeable slowdown. To avoid this issue, migrate images in relatively small batches (only those needed for a particular session), or migrate a large batch when you plan to be away from the computer for a while.

Soundtrack Pro running in Mac OS X 10.4.6 quits unexpectedly while fixing pops and clicks

This article has been archived and is no longer updated by Apple.

In Soundtrack Pro, if you analyze an audio file in the Waveform Editor by selecting Clicks and Pops, then try to fix the file, Soundtrack Pro may unexpectedly quit if you are running Mac OS X 10.4.6 on a PowerPC-based computer.

Update to Mac OS X 10.4.7 or later to address this issue.

If you're not able to update to Mac OS X 10.4.7 and you need to analyze an audio file for clicks and pops with Soundtrack Pro, then use Mac OS X 10.4.5. If you have already updated to Mac OS X 10.4.6 and are not running any other applications that require 10.4.6, revert to Mac OS X 10.4.5 using the following steps:

1. Perform an archive and install of Mac OS X Tiger from your install media.
2. Update to Mac OS X 10.4.5 using the Mac OS X 10.4.5 Combo Updater.

Mac OS X Server: How to export LDAP contents in LDIF format

This article has been archived and is no longer updated by Apple.

This article explains how to export LDAP entries in LDIF format.

Note: Exporting user accounts to LDIF format includes only user passwords with type "Crypt" and not those with type "Password Server" or "Open Directory.

You can use the Terminal Application to export LDAP contents in LDIF format by following these steps:

1. In the Terminal, type the following:

   ```
   $ sudo ldapsearch -LLL -H ldap://<IP Address> -b "<distinguished name>" > <target>
   ```

   Where `<IP Address>` is the IP Address or the Fully Qualified Domain Name of the server hosting the LDAP database, `<distinguished name>` specifies the path to the users container which is being backed up, and where `<target>` is the target file to which the LDIF information will be written.

2. Press the Enter key.

Example

The following example will export User account information to a file "userexport.ldif":

```
sudo ldapsearch -LLL -H ldap://myserver.foo.com -b "cn=users,dc=foo,dc=com" > userexport.ldif
```

Where "ldap://myserver.foo.com" is the Fully Qualified Domain Name of the server hosting the LDAP database, "cn=users,dc=foo,dc=com" specifies the path to the users container which is being backed up ("cn=users" is the root-level container which contains user records, and "dc=example,dc=com" is the Search Base.), and "userexport.ldif" is the target file to which the LDIF information will be written.

The ldapsearch command requires one to specify a distinguished name, which is the method of describing a path to an object. A distinguished name is composed of a container name (cn=users, cn=groups, or cn=computer_lists) followed by the search base. To determine the search base, connect to the LDAP server with Server Admin and select **Open Directory > Settings > Protocols > LDAP > Search Base**.

To export all users from a server with search base "dc=example,dc=com":

```
cn=users,dc=example,dc=com
```

To export all groups from a server with search base "dc=example,dc=com":

```
cn=groups,dc=example,dc=com
```

To export all computer lists from a server with search base "dc=example,dc=com":

```
cn=computer_lists,dc=example,dc=com
```

iMovie HD 6: Clips in Trash after closing project with Mac OS X 10.3.9

This article has been archived and is no longer updated by Apple.

You may find that your changes were not saved after reopening a project you were working on earlier. Some of the clips you were working on may be found in the iMovie Trash.

This happens if you closed the document and then clicked Save when iMovie HD prompted you to save changes.

To avoid this issue, save your iMovie project (**File > Save Project** or Command-S) before closing the iMovie window.

This issue does not affect Mac OS X 10.4 or later.

Aperture: Import panel shows current time for all images

This article has been archived and is no longer updated by Apple.

When importing images directly from a camera, all images in the Import panel appear to be time stamped with the current time, rather than the original capture time. (Note that after import, the images will display the correct capture time.)

This issue can occur if a camera is directly connected to the computer, and the camera is set to PTP file transfer mode. There are several ways to avoid the issue:

- Use a card reader instead of directly connecting the camera to the computer.
- Set the camera to "normal" or "PC connection" mode, rather than "PTP".
- After opening Aperture's Import panel, close and re-open it before importing images.

Any of the above will resolve the issue.

This issue is resolved in Aperture 3.

About the security content of the QuickTime 7.1 Update

This article has been archived and is no longer updated by Apple.

This document describes the security content of the QuickTime 7.1 Update, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

QuickTime 7.1 Update

- **QuickTime**

  CVE-ID: CVE-2006-1458

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted JPEG image may result in an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt JPEG image, an attacker can trigger an integer overflow which may result in an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of JPEG images.

- **QuickTime**

  CVE-ID: CVE-2006-1459, CVE-2006-1460

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted QuickTime movie may result in an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt QuickTime movie, an attacker can trigger an integer overflow or buffer overflow which may result in an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of QuickTime movies. Credit to Mike Price of McAfee AVERT Labs for reporting these issues.

- **QuickTime**

  CVE-ID: CVE-2006-1461

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted Flash movie may result in an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt Flash movie, an attacker can trigger a buffer overflow which may result in an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of QuickTime movies. Credit to Mike Price of McAfee AVERT Labs for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2006-1462, CVE-2006-1463

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted H.264 movie may result in an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt H.264 movie, an attacker can trigger an integer overflow or buffer overflow which may result in an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of H.264 movies. Credit to Mike Price of McAfee AVERT Labs and ATmaCA working through TippingPoint and the Zero Day Initiative for reporting these issues.

- **QuickTime**

CVE-ID: CVE-2006-1464

Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

Impact: Viewing a maliciously-crafted MPEG4 movie may result in an application crash or arbitrary code execution

Description: By carefully crafting a corrupt MPEG4 movie, an attacker can trigger a buffer overflow which may result in an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of MPEG4 movies. Credit to Mike Price of McAfee AVERT Labs for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2006-1249

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted FlashPix image may result in an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt FlashPix image, an attacker can trigger an integer overflow which may result in an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of FlashPix images. Credit to eEye Digital Security and Mike Price of McAfee AVERT Labs for reporting these issues.

- **QuickTime**

  CVE-ID: CVE-2006-1465

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted AVI movie may result in an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt AVI movie, an attacker can trigger a buffer overflow which may result in an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of AVI movies. Credit to Mike Price of McAfee AVERT Labs for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2006-1453, CVE-2006-1454

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted PICT image may result in an application crash or arbitrary code execution

  Description: Two issues affect QuickDraw when processing PICT images. Malformed font information may cause a stack buffer overflow, and malformed image data may cause a heap buffer overflow. By carefully crafting a malicious PICT image, an attacker may be able to cause arbitrary code execution when the image is viewed. This update addresses the issue by performing additional validation of PICT images. Credit to Mike Price of McAfee AVERT Labs for reporting these issues.

- **QuickTime**

  CVE-ID: CVE-2006-2238

  Available for: Mac OS X v10.3.9 and later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Viewing a maliciously-crafted BMP image may result in an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt BMP image, an attacker can trigger a buffer overflow which may result in an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of BMP images.

  This issue was originally identified in CVE-2006-1983, but a new CVE name was assigned.

Logic appears to stop responding ("hang") while scanning Audio Units

This article has been archived and is no longer updated by Apple.

Logic can appear to be unresponsive or stuck while scanning Audio Units.

This happens because a plug-in will sometimes generate a dialog box that must be dismissed before scanning can continue. In some cases, this dialog may be hidden behind the Logic splash screen. Click the AU Manager icon in the Dock to reveal the dialog, then dismiss it.

Aperture Resources

This article has been archived and is no longer updated by Apple.

Support

In the United States and Canada, all newly registered users of Aperture receive 90 days of complimentary software support via telephone from the date of purchase. In addition, Apple offers a range of professional support options.

Aperture Discussion Boards

The Aperture Discussion forum is filled with experienced users. Ask a question, answer a question, or simply read what other Aperture users have to say.

Aperture Support Site

Apple's Support website is filled with the best information for Aperture users. On this site, you can:

- search for helpful Knowledge Base articles
- troubleshoot an issue
- download software updates for Aperture

Go to the Aperture Support website

Aperture Help

The built-in Help menu in Aperture gives you direct access to a searchable user manual that contains all sorts of information, such as how to set up and configure Aperture, how to perform image adjustments, or how to order books and prints.

Choose the Help menu in Aperture to access the user manual and other helpful resources.

Aperture manuals are also available online. Visit the Apple Manuals website.

Apple Pro Training

The Apple Pro Training Series is Apple's official curriculum. Offered as a self-paced learning tool and used in all instructor-led courses, Apple chooses the authors because of their industry expertise.

The instructor-led courses are offered at Apple Authorized Training Centers across North America, Europe, Japan, Australia and Asia. Taught by Apple Certified Trainers, the courses balance concepts and lectures with hands-on labs and step-by-step real-world exercises.

Upon completion of the course material, a student can become an Apple Certified Pro by taking the certification exam offered only at Apple Authorized Training Centers. Successful certification as an Apple Certified Pro gives you official recognition of your knowledge of Apple's professional applications.

Aperture does not launch because Library is locked

This article has been archived and is no longer updated by Apple.

In a certain rare situation, you may see this message when you try to launch Aperture:

> "The database for the library ' /Aperture Library.aplibrary' is locked and cannot be used at this time."

If you Get Info on the Aperture Library package, it shows normal read-write permissions, and the Locked box is not selected.

Solution

Follow these steps:

1. Open the Terminal (located at /Applications/Utilities).
2. At the prompt, type "`cd `" (note the space).
3. Drag the folder that contains your Aperture Library into the Terminal window. After that, the command line will look something like this (but will vary depending on the path to your library):

   ```
   cd /yourusername/Pictures/
   ```

4. Press Return.
5. Type: `cd Aperture\\ Library.aplibrary/Aperture.aplib`
6. Press Return.

   Warning: The next step uses the "rm" command. Misuse of the rm command can result in unintended data loss, up to and including the entire contents of your hard disk. So be sure to type the command as shown.
7. Type: `rm Library.apdb.lock`
8. Press Return.

Mac OS X Server 10.4: "Bad address syntax error" message when sending e-mail using WebMail

This article has been archived and is no longer updated by Apple.

Users who connect to a 10.4 server via its IP address instead of its fully qualified domain name (FQDN) may get this error when trying to send email via WebMail:

> "501 Bad address syntax error".

Solution

Set the server's domain name in the SquirrelMail configuration file. You can do this by using the Terminal application to run an interactive configuration script with root privileges.

1. In the Terminal, type the following command, and then press Return:

   ```
   sudo /etc/squirrelmail/config/conf.pl
   ```

2. At the "Command >> " prompt, type the number 2 for Server Settings, and press Return.
3. At the "Command >> " prompt, type the number 1 to edit Domain, and press Return.
4. At the "[getenv(SERVER_NAME)]: " prompt, type your server's domain name, such as example.com, and press Return.
5. At the "Command >> " prompt, type the letter S to save your settings, and press Return twice.
6. At the "Command >> " prompt, type the letter Q to quit, and press Return.

Further information about configuring SquirrelMail is available in the Web Technologies Administration guide and in Mac OS X Server Help.

Logic Pro 7.2.1 converts some compressed files to AIFF

This article has been archived and is no longer updated by Apple.

Logic Pro 7.2.1 is now able to play compressed audio files directly. In some cases, when an MP3 or AAC file is added to a song, the file is rendered as AIFF instead.

Solution

An MP3 or AAC file must meet these technical requirements for Logic Pro to play it directly:

- 44.1 kHz
- Bit rate of at least 32kbps (mono) or 48kb/sec (stereo)
- Created by iTunes 5 or later, or by Logic 7.0 or later

You can still use compressed files that do not meet all of these conditions, but they have to be rendered as AIFF first.

Mac OS X Server 10.4.2: Internal Server Error when connecting to Mac OS X Server Weblog

This article has been archived and is no longer updated by Apple.

After enabling the web and weblog services in Mac OS X Server, users connecting to the weblog in a web browser may encounter an Internal Server Error message.

This issue affects Xserve G5 and Mac OS X Server 10.4.2.

Solution

This issue is due to incorrect permissions for the Tomcat service that provides weblog function. To resolve the issue:

1. Disable Weblogs in Server Admin.
2. Execute these commands in the Terminal:

```
$ sudo chown -R appserver:appserveradm /Library/Tomcat/blojsom_root
$ sudo chmod -R 770 /Library/Tomcat/blojsom_root
```

3. Update the Mac OS X Server software to 10.4.6 or later.
4. Re-enable Weblogs in Server Admin.

iSync: Palm OS-based device only syncs some information

This article has been archived and is no longer updated by Apple.

Issue or symptom

When a Palm OS-based device (including handhelds and phones) syncs calendars, it may not sync contacts, or not all information is transferred from the computer to the device during a sync. The iSync log may state that the Palm device unexpectedly disconnected during sync.

Solution

This can occur if the Palm OS-based device runs out of memory during the sync.

Important: If you are using a Palm OS-based Treo provided by Verizon, read iSync: Can't sync Verizon Treo with iSync before performing the following steps.

To resolve this issue, narrow the range of events you've selected to sync with this device. For example, select "Ignore Palm events older than: One Week" if you don't need to synchronize all of your Address Book contacts with your device.

You can also synchronize only a specific group of contacts from your Address Book to save device memory. Create a group in Address Book which contains the contacts you want to sync with your device. Then, select this group from the iSync Synchronize pop-up menu within the Contacts section of the device's setup pane.

If the issue persists, check to see how much available memory is available on your Palm device. If you are low on device memory, you can remove unused applications, photos, sounds or other unused items from the device to free up memory. Consult your device documentation for more information.

On some Palm-based devices, restarting the device (performing a "soft reset") may also free up additional memory or resolve this issue. Consult your device documentation for more information.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About the Mac OS X 10.4.7 Update (delta)

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.7 Update (delta) updates Mac OS X 10.4.6 to version 10.4.7 on both Intel-based Macs and PowerPC-based Macs. (If you are updating from *Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, or 10.4.5* to 10.4.7, see this article instead.)

Important: Please read before installing.

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- If issues occur during installation--for example, Software Update quits unexpectedly, please see this article.

Installation

There are two ways to update to Mac OS X 10.4.7: Use Software Update or the standalone installer. You only need to use *one* of these methods to update your computer.

Automatic Software Update
Software Update, located in the **Apple** menu, will automatically download the latest Apple software. (Software Update might have linked you to this article to learn more about the update.) Note that the update's size may vary from computer to computer when installed using Software Update. Some updates must be installed prior to others, so you may need to run Software Update more than once to get all of the available updates.

Standalone installer
Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. Two versions of the standalone installer are available from Apple Downloads: a delta and combo.

- The delta update for PowerPC and Intel-based Macs installer (described here) updates Mac OS X 10.4.6 to 10.4.7.
- The combo update installer (described in this article) updates Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, and 10.4.6 to 10.4.7.

Improvements

This update offers many improvements, including:

Mail

- Updates Help links within Mail alert messages so you are linked to useful content instead of a "No pages with your search words were found" page.
- Resolves a sync alert issue that could appear if Mail accounts were in different order on the different Macs that you were syncing.
- The Mail POP account option to "Remove copy from server after retrieving a message..." is no longer turned off after performing a sync with .Mac.
- POP accounts you create will no longer begin with the "Remove copy from server after retrieving a message..." preference setting turned off.
- Redirecting message to only a BCC: address no longer redirects the message to the original To: recipients as well.
- Improves results when retrieving IMAP messages with attachments over unreliable connections.
- Mail now supports connecting to mail servers through a SOCKS proxy.

iChat

- Improves compatibility for iChat when using a video input source that's connected to a third-party video card.
- Improves reliability when transferring files to or from AIM account users via iChat.
- Addresses an issue on PowerPC-based Macs that prevented video conferencing when not enough shared memory was available.
- Addresses potential causes of "insufficient bandwidth" alerts in iChat.
- If a conference doesn't start as expected, iChat will now offer to send a report to Apple for investigation.

Syncing

- Improves support for Motorola cell phones that sync via iSync and Bluetooth
- Addresses issues that could cause iDisk syncing to fail without alerting you or with a "Last sync failed" alert.
- iDisk syncs in progress are now more responsive to cancel requests.

- Shortens the time for cancellation of an iPod contact-and-calendar sync, if cancellation requested shortly after sync.
- Improves certain .Mac connection failure alerts that included misleading error messages.
- Resolves an issue in which the initial .Mac sync would fail if all data classes were selected to be synced (but future syncs would succeed).
- Addresses a number of issues related to .Mac syncing of tasks, bookmarks, and contacts.
- Addresses an issue for Mac OS X 10.4.6 in which you might not be able to sync via iSync 2.2 with Sony Ericsson k700i or S700i phones.

Finder and Apple applications

- Manually removing unwanted fonts from /System/Library/Fonts/ will no longer potentially cause Finder to unexpectedly quit.
- TextEdit will no longer unexpectedly quit if Helvetica fonts have been disabled in Font Book.
- You can now create compressed disk images larger than 60 GB.
- In iCal, a "Print Error while printing" alert message will no longer appear when creating a PDF with one of these options: Compress PDF, Encrypt PDF, Mail PDF, Save As PDF-X, Save PDF to iPhoto, or Save PDF to Web Receipts.
- Addresses issues that might prevent Sudden Motion Sensor information from appearing in System Profiler or other utilities.
- Addresses an issue in which some PDF files could be shifted to the right when printed from Safari.
- Resolves an issue in which, under certain circumstances in the Japanese language version of Mac OS X 10.4, the Add Bookmark command may not work in Safari.
- Addresses an issue in which Aperture 1.1 could unexpectedly quit while using full-screen mode.
- Improves reliability when rebuilding a problematic RAID 1 (mirror) set in Disk Utility.
- Disk Utility will no longer report unexpected messages after Adobe Illustrator CS2 or Photoshop CS2 are installed.
- Resolves an issue in which an error message might appear when attempting to print a document using the "Save PDF to iPhoto" option.
- Automator supports more file types, including JPEG, TIFF, and HTML, in the Filter Finder Items action.
- Automator supports more websites that require cookies and sessions, specifically those where the authentication is passed along with the URLs, in the Get Image URLs for Webpage, and Get Link URLs from Webpages actions.
- Improves responsiveness when dragging Automator actions in the workflow.
- Resolves an issue in which Soundtrack Pro may unexpectedly quit on PowerPC-based Macs after you analyze an audio file in the Waveform Editor by selecting Clicks and Pops.
- If you press the Kana key twice in a row while using the Kotoeri input method, the Finder and applications will no longer unexpectedly quit on Intel-based Macs.
- Addresses an issue in which iTunes, the Finder, or other applications could unexpectedly quit under certain circumstances while using Kotoeri input.

Third-party

- Adds support for Sierra wireless cards AirCard 580 (AC580), PC5220, and for the Novatel V620, S620, and U730 wireless cards for PowerBook computers.
- Improves compatibility for Adobe Photoshop CS2 by preventing menu items being highlighted if the cursor was in an image's zoom field.
- Improves compatibility for Microsoft Virtual PC—the installer application will no longer unexpectedly quit when performing an uninstallation.
- Prevents certain Adobe and Quark applications from unexpectedly quitting when saving a file to a non-Apple AFP server.
- Resolves an issue in which printing certain documents on some HP LaserJet printers caused an error "79.01FE" to be displayed.

Networking and Xsan

- Addresses an issue that could cause files to be deleted when duplicating them in the Finder on a mounted AFP volume.
- Addresses an issue that could cause the error "Bad file descriptor" when using the `cp` command to copy a file to an AFP volume.
- Mac OS X 10.4 computers now respond to Layer 2 Multicast ARPs.
- Addresses an issue in which the configd process could take excessive CPU resources when a DHCP server sent a malformed DHCP response.
- The included Apple VPN client now supports group membership on Cisco VPN servers.
- Improves reliability of the `lsof` command on systems with a large amount of RAM installed.
- Resolves an issue that could cause Xsan clients to stop responding when accessing the SAN if an Xsan peer was rebooted.
- Increases the maximum number of vnodes on systems with 2 GB or more RAM to avoid an issue that could cause Xsan clients to become unresponsive when the vnode table became full.
- Resolves an issue using "Save As..." from certain Adobe applications to an Xsan volume reshared via AFP.
- The `cp`, `mv` and `tar` commands now pre-allocate space on Xsan volumes to avoid file fragmentation.
- Safari will no longer intermittently, unexpectedly quit if you use PAC (Proxy Auto Configuration) files.
- Addresses an issue in which Apple Remote Desktop clients could stop updating the admin's control screen.

Other

- Resolves an issue for Mac OS X 10.4.6 and PowerPC-based Macs in which some applications may silently fail to open, or you could see "error: can't fragload" when trying to open an application.
- Addresses an issue in which HTML files on a downloaded disk image might not be readable, and a "Safari cant find the file. No file exists at the address /private/tmp/..." alert appears, after Safari mounts the downloaded image.

- Resolves an issue that prevented users with Active Directory accounts from logging in if "Use UNC path from Active Directory" was enabled.
- Resolves an issue in which Intel-based Macs could not bind to Active Directory when multiple domain controllers are available.
- Adds RAW image support for these cameras: Olympus C7070, Olympus E330, Olympus E500, Minolta Dynax 5D, Minolta Maxxum 5D, and Pentax *ist DL.
- Addresses an issue that prevented the Apple USB Modem from receiving faxes on some computers.
- You can now verify whether or not a Dashboard widget you downloaded is the same version as a widget featured on (www.apple.com) before installing it.
- Includes recent Apple security updates.

About the Mac OS X 10.4.7 Update (combo)

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.7 Update (combo) updates Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, or 10.4.6 to version 10.4.7 on both Intel-based Macs and PowerPC-based Macs. (If you are just updating from Mac OS X 10.4.6 to 10.4.7, see this article instead.)

Important: Please read before installing

- If you use iSync, you should perform a full sync with your devices before installing this update. Mac OS X 10.4.7 Update includes a later version of iSync with several improvements. For more information and before-you-install steps, see this article.
- With this update, PowerPC-based Macs will restart twice, instead of once, after the initial installation.
- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- If issues occur during installation--for example, Software Update quits unexpectedly, please see this article.

Installation

There are two ways to update to Mac OS X 10.4.7: Use Software Update or the standalone installer. You only need to use *one* of these methods to update your computer.

Automatic Software Update
Software Update, located in the **Apple** menu, will automatically download the latest Apple software. (Software Update might have linked you to this article to learn more about the update.) Note that the update's size may vary from computer to computer when installed using Software Update. Some updates must be installed prior to others, soyou may need to run Software Update more than once to get all of the available updates.

Standalone installer
Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. Two versions of the standalone installer are available from Apple Downloads: a delta and combo.

- The delta update installer (detailed in a different article) updates Mac OS X 10.4.6 to 10.4.7.
- The combo update installer for PowerPC and Intel-based Macs (described here) updates Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, or 10.4.6 to 10.4.7.

Improvements

This update offers many improvements. For a list of some of them, see About the Mac OS X 10.4.7 Update (delta).

This update also includes improvements delivered with earlier Mac OS X 10.4 updates, as described in these articles:

- About the Mac OS X 10.4.6 Update (delta)
- About the Mac OS X 10.4.5 Update (delta)
- About the Mac OS X 10.4.4 Update (delta)
- About the Mac OS X 10.4.3 Update (delta)
- About the Mac OS X 10.4.2 Update (delta)
- About the Mac OS X 10.4.1 Update

iWeb 1.1: Slideshow doesn‘t launch if an apostrophe is in the title

This article has been archived and is no longer updated by Apple.

After updating to iWeb 1.1 and publishing a photo page, your slideshow may not launch when viewing the site.

Update to iWeb 1.1.1 or later to address this.

If you're not able to update right away, you can prevent this by avoiding apostrophes (single quotation mark) in your photo page names (for example, Carrie's Photos).

You can change a page name by double clicking it in the Site Organizer and typing a new name.

Note: You must republish your photos page after changing the page name in order to regain the Slideshow functionality in your published page.

Mac OS X Managed Client: Managed proxy settings do not appear in Network preferences

This article has been archived and is no longer updated by Apple.

When managing the proxy settings in Workgroup Manager, these settings are not reflected in the Network pane of System Preferences. However, the settings do still apply. You can use this command on Mac OS X 10.4 to view the current proxy settings:

```
sudo <currentUser> scutil --proxy
```

Power Macintosh G3: US Robotics Sportster 33.6 Modem Not Connecting to ISP

Unless a new modem script is used, the US Robotics Sportster 33.6 modem attempts to connect, but fails with "No Carrier".
This article has been archived and is no longer updated by Apple.

Symptom

The US Robotics Sportster 33.6 modem dials, but will not connect to the your Internet service provider (ISP). A "No Carrier" error occurs.

Solution

Replace the modem script.

US Robotics, part of 3Com, has an updated modem script that resolves this issue. The name of this script is "US Robotics High Speed". It is available from the following Web site: http://www.usr.com/support/downloads-template.asp?prod=s-mac

Once at this location, download **USR Universal Script**, the file is named "usrara.hqx".

This file should be placed into the Modem Scripts folder inside the Extensions folder. Once installed you can select this modem script in the Modem control panel.

iWeb: Comment count may not appear on Blog Summary pages after turning on comments

This article has been archived and is no longer updated by Apple.

Symptom

Blog comment counts won't appear on the summary page if the number of excerpts shown is equal to ten.

Existing entries should also indicate "No comments" after each entry, but they do not.

This can happen in iWeb 1.1 if you enable comments on a blog that was originally created using iWeb 1.0 or 1.0.1.

Update to iWeb 1.1.1 or later to resolve this.

Mac OS X Server: How to reset a mailing list password

This article has been archived and is no longer updated by Apple.

If you lose the password to a mailing list, you can use the Terminal to set a new one. This requires System Administrator (root) privileges. Use this command in Terminal:

```
$sudo /usr/share/mailman/bin/change_pw --listname=mailman --password=newpassword
```

Note: Replace "newpassword"with the password you want to set for this list.

To see other password modification options for mailman, use this command:

```
/usr/share/mailman/bin/change_pw --help
```

Final Cut Studio is not supported on MacBook

This article has been archived and is no longer updated by Apple.

If you have a MacBook, the Final Cut Studio (Universal) crossgrade Installer does not prohibit you from installing the pro applications, but this configuration does not meet the minimum system requirements for Final Cut Studio.

See the Final Cut Studio system requirements for complete requirements.

Note: The integrated graphics processor in the MacBook does not permit float processing in Motion and will result in degraded performance and other issues in Motion and other Final Cut Studio applications.

Mac OS X 10.4: Intel-based Mac startup issue after installing QuickTime 7.1

This article has been archived and is no longer updated by Apple.

After installing QuickTime 7.1 on an Intel-based Mac, the computer might not completely start up if third-party startup items are installed. Startup stalls before the desktop appears. If your computer uses a **wireless** connection, please skip to the section named "For computers using wireless connections."

Solution

1. Start in Safe Mode by holding the Shift key during start up.

   Tip: If the startup process is stalled, you can hold the computer's power button a few seconds to shut down your computer.

2. Download and install QuickTime 7.1.1 or later.

The computer should now start up normally.

For computers using wireless connections

This second set of steps works for computers that use a **wireless** connection, such as a built-in AirPort Extreme card, to connect to a wireless access point. If you live in an area where the Internet reaches your home wirelessly but then connects to your computer via a wire, please use the section above.

1. Start in Safe Mode by holding the Shift key during start up.

   Tip: If the startup process is stalled, you can hold the computer's power button a few seconds to shut down your computer.

2. Click the Finder icon in the Dock.
3. Choose **Go > Go to Folder...** .
4. Type: `/Library/StartupItems/`
5. Click Go.
6. Drag the contents of the StartupItems folder to your desktop.
7. Restart.
8. Download and install QuickTime 7.1.1 or later.
9. Repeat steps 2 through 5.
10. Drag the items you moved to your desktop in step 6 back into the StartupItems folder.

The computer should now start up normally.

This document will be updated as more information becomes available.

Mac OS X Server: How to use Mail service with Active Directory users

This article has been archived and is no longer updated by Apple.

Active Directory users who try to use mail services hosted on a Mac OS X Server v10.4 or later will be unable to send or receive mail using the default mail service configuration. To allow them to access mail service, An administrator must set Service ACLs (access control lists) for selected users or groups.

To configure Service ACLs for mail service, follow these steps:

1. In Server Admin, select the hostname of your server, and click the Access tab.
2. Deselect the "Use same access for all services" checkbox.
3. Select Mail.
4. Set the radio button above the user list to "Allow only users and groups listed below."
5. Click the "+" button, and drag the users and/or groups for which you want to enable mail service into the list.
6. Click the Save button.
7. Restart the Mail service.

Mac OS X 10.4: Issues authenticating after changing keyboard layout

This article has been archived and is no longer updated by Apple.

If you change your keyboard layout after logging in, you may have issues entering a name and password when Mac OS X displays an authentication window—for example, when you try to make certain changes in locked System Preferences or install software.

Log out and back in after changing your keyboard layout to resolve the issue.

Additional information

This happens because authentication windows use the keyboard layout that was active at login.

About the security content of Xcode Tools 2.3

This article has been archived and is no longer updated by Apple.

This document describes the security content of Xcode Tools 2.3, which can be downloaded and installed from the Apple Developer Connection.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Xcode Tools 2.3

- **WebObjects**

  CVE-ID: CVE-2006-1466

  Available for: Mac OS X v10.4 and later

  Impact: If you install WebObjects developer tools, remote attackers may be able to obtain or modify WebObjects projects while Xcode is running

  Description: The WebObjects Xcode plug-in provides the ability to manipulate projects through a network service. This service is accessible to remote systems while Xcode is running. This update addresses the issue by limiting this service to the local system. This issue does not affect default installations of Xcode Tools. Only systems with the WebObjects plug-in installed are affected. Credit to Mike Schrag of mDimension Technology for reporting this issue.

Mac OS X Server 10.4: No user warning when print server quota exceeded

This article has been archived and is no longer updated by Apple.

When quotas are enforced on a print queue hosted on Mac OS X 10.4 Server, users don't receive any notification when they exceed their print quota. The job, or part of the job, will fail to print without reporting any error to the user. The reason for the failure will appear in the server's logs.

To verify that a print failure occurred because the user exceeded his or her quota, check the `/var/log/cups/error_log` on the server. You can view this log in Server Admin:

1. Select the Print Service.
2. Click the Logs tab.
3. Choose **Error Log** from the **Show** pop-up menu.
4. Look for a line that contains a message like this:

```
Job 55 cancelled: pages exceeded user quota limit on printer
```

You can reset this user's print quota in Workgroup Manager:

1. Select the Accounts pane.
2. Select the user.
3. Click on the Printer Quota tab.
4. Click the Reset Print Quota button (for all queues) or the Restart Print Quota button (for an individual queue).
5. Click Save.

iWeb: Avoid using apostrophes in your iWeb site/page names

This article has been archived and is no longer updated by Apple.

If you create a site or page name in iWeb 1.0.1 with an apostrophe as part of the name, and subsequently update to iWeb 1.1, then the web addresses (URLs) to your site/page will no longer be valid. This will break any existing bookmarks to the page. This occurs because iWeb 1.1 handles apostrophes differently than iWeb 1.0.1.

People who bookmarked your iWeb 1.0.1 site need to bookmark your new site published with iWeb 1.1.

Final Cut Pro: Apply the Broadcast Safe filter last

This article has been archived and is no longer updated by Apple.

Using the Broadcast Safe filter is a good way to ensure that the levels in your project will conform to the specifications required for television. In order for the Broadcast Safe filter to be effective and accurate when used, it should be the last filter applied to a clip or nested sequence.

Background

Final Cut Pro allows you to create imagery using any of the millions of colors your computer can produce. A mistake beginners often make when creating graphics for video is to use colors that are vivid on the computer display, but have chroma and luma levels that are out of specification for the "legal" range of color for television. Also, many modern cameras are capable of recording video levels which are beyond the broadcast-legal range for the NTSC and PAL specifications. Broadcasters adhere strictly to these specifications and will reject tapes that are not "broadcast safe," because those levels can cause problems in the television signal.

In order to achieve accurate and predictable results with the Broadcast Safe filter, it's important to understand that filters are applied in series in Final Cut Pro. In other words, the order in which a given set of filters are applied will affect the end result.

The next two images illustrate an example of how the order in which filters are applied can affect the resulting image.

Gaussian Blur, then **Diffuse**

Diffuse, then **Gaussian Blur**

As seen above, the order of the filters makes a difference, even when the same filters are used. This is why it's important to add Broadcast Safe last. If you add a filter like Proc Amp after Broadcast Safe, the result might include levels that are no longer within the safe range.

Tip: The following steps outline a simple method for adding the Broadcast Safe filter at the end of the editing workflow:

1. Wait until your project is completely edited before adding the Broadcast Safe filter.
2. Select all items in the Timeline of your main sequence.
3. Choose **Sequence > Nest Item(s)** to group everything into a consolidated, nested item.
4. Control-click on the nested item in the Timeline and choose **Open in Viewer** from the shortcut menu.
5. Choose **Effects > Video Filters > Color Correction > Broadcast Safe**
6. Choose appropriate settings in the Viewer's Filters tab.

Adding the Broadcast Safe filter as a last stage (as in the steps above) can serve to ensure that video levels remain within the safe range.

For more information about using filters in Final Cut Pro, and to learn about using video scopes to monitor video levels, see the Final Cut Pro User Manual, available from the Help menu in Final Cut Pro.

Macs with LSI 22320 Ultra SCSI Card may stop responding ("hang") on restart or shutdown

This article has been archived and is no longer updated by Apple.

When certain Seagate SCSI hard drives are connected to the LSI 22320 Ultra SCSI Card that shipped as a configure-to-order option in certain PowerPC-based Macintosh computers, the computer will stop responding ("hang") during shutdown or restart.

Apple included LSI 22320 Ultra SCSI cards on some PowerPC-based Macintosh computers as a configure to order option to support the addition of tape drives, but did not ship any SCSI hard drives with the card. If you have added a Seagate hard drive to the card's bus, you should check the Seagate website to see if the drive you have is compatible with the card.

If you determine that a hard drive is incompatible with the card, you should remove the hard drive.

Final Cut Pro: Read Prefetch settings for Xserve RAID

This article has been archived and is no longer updated by Apple.

If you are using an Apple Xserve RAID for video in high data rate formats (such as Uncompressed SD formats or HDTV formats), a Read Prefetch setting of 128 stripes (8 MB) is recommended. When using a Read Prefetch setting of 128 stripes, you may be able to further increase the Xserve RAID's performance by storing audio-only files on a separate drive system (such as a second internal ATA or SATA drive or second Xserve RAID).

If your project uses only compressed SD formats (DV or Offline RT) or stores a significant number of audio-only files to the Xserve RAID, a Read Prefetch setting of 8 stripes (512 KB) is recommended.

For additional information on tuning Xserve RAID settings, see "Xserve RAID 1.5 and Later: Optimizing performance."

Published Date: Feb 20, 2012

Final Cut Pro 5: "Unable to read the movie just captured"

This article has been archived and is no longer updated by Apple.

If you're using a non-controllable device for audio-only capture in Final Cut Pro 5, the capture may fail in some cases, and the following alert message may appear:

> "Unable to read the movie just captured"

This can happen if you're performing an audio-only capture from a non-controllable device (like a dedicated FireWire or USB audio interface), while there is also a video camera or deck connected to the computer via FireWire.

You can avoid this issue by simply disconnecting the camera or deck from FireWire while you are capturing audio-only. After your audio is successfully captured, you can connect the camera or deck to FireWire again without worry.

This document will be updated when more information becomes available.

Some QuickTime components may display white instead of video on Intel-based Macintosh computers

This article has been archived and is no longer updated by Apple.

Third-party developers can create components, or plug-ins, for the use in the open architecture of QuickTime. These third-party components expand the functionality of QuickTime, allowing QuickTime to play additional media types.

If you are using an Intel-based Mac, be sure to visit the component developer's website to download a Universal binary component that is compatible with Intel-based Macintosh computers. PowerPC-based QuickTime components will not work natively in QuickTime on an Intel-based Mac.

Please see the QuickTime third-party component page for a list of QuickTime components with links to their respective manufacturers.

If the required component is not available from the third party in a Universal version that will run on an Intel-based Mac, you can work around the issue by forcing QuickTime Player to run under Rosetta. Components that were developed for PowerPC-based Macs will be able to run while QuickTime is running under Rosetta. See "Intel-based Macs: Forcing a Universal application to run with Rosetta" for steps.

In addition to third-party components, there is also a QuickTime component that's made by Apple: the QuickTime MPEG-2 Playback Component. Apple has created a Universal version of this component for users of Intel-based Macs. If you purchased the PowerPC version of the MPEG-2 Playback Component from the Apple Store online, you are eligible to receive the Universal version for free. Follow the directions below to receive the updated MPEG-2 Playback Component.

1. Connect to the Apple Store. If you are not in the United States, choose your country's Apple Store from the menu at the bottom of the page.
2. Click "Your Account" in the store menu bar at the top right of the page.
3. Enter your Apple ID and password.
4. Click "Software Download Purchases". You will see a link to the QuickTime MPEG-2 Playback Component.
5. Click the link to download and install the updated version.

Final Cut Pro: Edit To Tape via a PCI Express I/O card may drop frames with HD

This article has been archived and is no longer updated by Apple.

In some cases, Final Cut Pro will drop frames when performing an Edit To Tape operation, when the video is in an HD format, and the Edit To Tape operation is performed via a PCI Express I/O card.

If your scenario matches these details, you can avoid the issue by disabling Mirror on Desktop while performing the Edit To Tape operation.

To change the setting for Mirror on Desktop, follow these steps:

1. Choose **Final Cut Pro > Audio/Video Settings**.
2. On the **Audio/Video Settings** window, click on the **A/V Devices** tab.
3. Deselect the **Mirror on Desktop** checkbox to disable Mirror on Desktop.

This document will be updated as more information becomes available.

Drive Setup 1.4: How to Format with Macintosh Extended Format

I tried using the instructions found in the Read Me file for Mac OS 8.1, to use Drive Setup 1.4 to format my hard drive as a Macintosh Extended Format drive but am not having any success.

Are there additional steps, other than the ones in the Read Me file, that I need to take to complete this process?
This article has been archived and is no longer updated by Apple.
Follow these instructions to use drive setup to format your drive as a Macintosh Extended format volume.

(1) Boot from the OS 8.1 CD or the Disk Tools Diskette for Mac OS 8.1
(2) Open Drive Setup
(3) Select the hard drive you would like to format
(4) Click the initialize button
(5) Click the customize button
(6) Select the number of partitions you would like to create (if you do not want to partition the drive, select 1 partition)
(7) Select the type of format (Macintosh Standard or Macintosh Extended Format (HFS+))
(8) Click OK
(9) Click Initialize

Logic Pro/Express 7.2 Enhancements

This article has been archived and is no longer updated by Apple.

Logic Pro and Logic Express 7.2 are the first Universal Binary releases for these two applications and also provide numerous functional improvements and fixes. This document lists the most significant enhancements which were incorporated between version 7.1.1 and 7.2 and not documented in New Features in Logic Pro 7.2, Late Breaking News About Logic Pro or Late Breaking News About Logic Express.

Arrange Window

- You can now change the name of a Frozen track without having to first un-freeze it.
- Packing multiple frozen tracks into a folder will no longer incorrectly invoke the dialog which stated "Current track is frozen, do you want to unfreeze it?".
- It is now possible to export "Region as Audio File" within a folder track without having to first make a track selection.
- Linked Edit windows now update properly when selecting Regions using the arrow keys.
- Editing Region based automation curves via the Control-Option keyboard shortcut now works as expected.
- In the Arrange window, Logic now correctly displays the Magnifying Glass when the Control key is held, regardless of which primary tool is selected.
- Logic now correctly creates tracks within folder tracks when using the "Create Multiple" Tracks command.
- Performing a Snip operation in the Arrange window no longer deletes Scene Cut Markers.
- Regions on protected tracks are no longer shifted when using the "Insert Time and move by Locators" command.
- Regions now consistently delete correctly in Shuffle L and Shuffle R edit modes.
- MIDI Regions will no longer change length when using Beat Mapping with Protect MIDI disabled in a song that starts at something other than bar 1.
- Logic will no longer quit unexpectedly if you drag an audio file into the Arrange window when there is no audio driver enabled in the Audio Hardware and Drivers Preference pane.
- Regions that belong to grouped tracks that have the "Arrange Select" option enabled are now properly selected when rubber-band selected in the Arrange window.
- The "Create New track with next Instrument" command will no longer bring up the "Current Track is Frozen" alert message when the selected track is frozen.
- Zooming speed now behaves normally at extreme zoom levels when dashed Automation edit lines are visible.
- Protected tracks now behave correctly and cannot be added to a folder track.
- Scrolling now behaves correctly when accessing the X/Y tool in the Arrange window with the Control-Shift modifier keys while pressing the mouse button.
- The locators now behave correctly when using the command: Splice > Insert Snipped Part at Song Position.
- A marker"s left border can now be moved or resized in the Global tracks while the Scissor tool is selected.

Track Based Automation

- Redundant Frequency band On/Off nodes are no longer written when recording touch automation for the Channel EQ.
- Automation Quick Access now works as expected with the following plug-ins not made by Apple: Arturia Minimoog and Native Instrument’s Absynth, Reaktor, and FM7.

Global Tracks

- Logic now correctly ignores muted notes when performing chord analysis in the Global Chord track.
- Clicking a Chord in the Global Track with the Pencil tool no longer causes Logic to quit unexpectedly.
- Logic now behaves as expected when dragging the Global tracks Transpose line above values of -1.
- The breakpoint editing line in the Global Transposition track will no longer intermittently jump back to its original position when being dragged upward.
- Beat Map analysis transient detection has been improved and corrects a condition that caused transients near the beginning of certain audio regions to be undetected.
- Using the "Hide Signature" setting will no longer also hide the signature from the Global track.

Effects Plug-ins

- Settings for the the AUMatrixReverb Audio Unit plug-in are now properly retained with a song.
- GoldVerb now retains its Wet/Dry settings correctly when saving and reopening a song it is used within.
- Dragging an Impulse Response file from the Finder into the Space Designer window now behaves as expected.
- Guitar Amp is now labeled correctly in Logic Express.
- Noise artifacts that occurred when EVOC20, Stereo Delay, and Compressor were processed by a Logic Node have been eliminated.
- Space Designer now correctly resolves Impulse Response file locations when Logic 7 is installed as an upgrade to Logic 6.4.2.

Software Instrument Plug-ins

- Plug-in settings will no longer be copied between songs in certain cases when two songs are open that have similar plug-ins in similar insert locations.
- The ES2 should no longer display missing parameters and artifacts when used on a Logic Node enabled track.
- EVB3 will no longer produce an audible artifact when the instrument is not being played and the Swell parameter is set to 0.

EXS24mkII

- EXS24 now loads the correct sample files even when there is a file with the same name in a different directory.
- It is now possible to simultaneously adjust the borders of multiple selected Zones within the EXS24 Instrument Editor.
- The Instrument > Move Audio Files command in the EXS24 Instrument Editor has been removed in order to correct a condition which caused the Sample Instrument file to be incorrectly moved.
- Using the key command for shifting Instrument Zones in the EXS Instrument Editor will no longer cause Logic to quit unexpectedly.

Ultrabeat

- Ultrabeat samples will no longer reload under special circumstances when saving a song.
- Ultrabeat will no longer erroneously display level meters even though samples are missing and audio is not actually playing. The condition occurred with certain songs that were saved as a project with all options set to Copy.
- One-shot-Trigger mode in Ultrabeat now behaves correctly when the UltraBeat step sequencer is turned off and back on again.

Apple Loops

- MIDI Regions for Software Instrument Apple Loops are now correctly placed when imported to a track within a folder.
- The Loop Browser now includes an "ALL" filter button for displaying all loops regardless of how they are Meta tagged.
- Newly indexed Apple Loops folders now show up immediately in the Loop browser, without having to quit and re-open Logic.
- In the Loop Browser, Logic now correctly displays the search history when clicking the magnifying glass to the left of the text entry field.

Matrix Editor

- In the Matrix Editor, clicking with the Velocity tool on a note no longer triggers the sound a second time on mouse release.
- When using Hyper Draw in the Matrix Editor, the help tag window no longer obscures the cursor when editing the automation.
- In the Matrix Editor, muted notes now correctly retain their mute state after drawing velocity ramps in the Hyper Draw.

Sample Editor

- Using the "Percussive" algorithm in the Time and Pitch Machine should no longer cause audio clipping under some circumstances.
- Canceling a destructive edit of a stereo file in the Sample Editor no longer results in silence on the left side of the file.

Score Editor

- Independent Notes can now be assigned a color using the Note Attributes menu.
- Moving the SPL in the Arrange window now updates the Score Window correctly when Catch mode is enabled.
- Moving bars with the Layout tool in the Score Editor should no longer create unexpected graphic glitches.

Event Editor

- It is now possible to modify the SMPTE value in the Event List using the plus or minus keys.
- It is now possible to double-click a note value in the Event List and enter a new value.
- Logic behaves as expected when opening the Val or Num Pop-up-menu in the Event List to change program or bank select commands.
- A rubber-band selection in the Event List now behaves correctly when auto scrolling is activated.
- Using the Mute Folder/Region key command in an Event Editor now works as expected.
- Rubber-banded selections of Audio Regions in the Arrange window will now be consistently displayed in the Event Editor.
- Rubber-banded selections of multiple notes in the Matrix Editor are now consistently displayed in the Event Editor.

File Management

- When two Broadcast Wave files are merged in the Arrange window, the start time now correctly updates to the start time of the newly merged file.
- Logic now correctly handles renaming of files and extensions when converting interleaved files to split stereo files using the Audio window's Copy/Convert operation, or when converting split stereo SDII files to AIFF or WAV.
- Audio files exported as AAC files will now play properly via iTunes when being shared over a network.
- The Project Manager now consistently displays the complete Sampler Instrument library folder after the scan or expanded scan process is complete.
- ReCycle files can no longer be dragged from the Finder onto audio tracks. This prevents a condition where undesirable artifacts were

introduced into ReCycle files when REX files were dragged onto Audio Instrument tracks.
- When bouncing a file to a split Stereo SDII format, the file extensions are now correctly recognized as an SDII file, rather than a Quicktime or graphics file.
- Audio files that are imported, dragged in from the Loop Browser, or created using the "Convert Regions to New Audio Files" command, now default to taking on the color of the track.
- Disc space requirements for surround bounce are now correctly calculated and displayed.
- Audio files bounced or exported as AAC mono files now play at the correct speed.
- Several issues regarding import of AAF files with a Japanese character in their name now behave correctly within Logic.
- The Audio window now correctly imports MP3 files without displaying an error message.
- A 96 khz 24 bit audio file in the Audio window can now be converted to an MP3.
- Logic should no longer quit unexpectedly under certain circumstances when exporting a song as an OpenTL file.
- Switching the sample rate in a session that contains frozen tracks now renders those tracks at the correct sample rate.
- Logic no longer displays an "Out of Memory" or "Missing Overview" alert dialog when importing audio files from the Project Manager.

General

- 96 kHz WAV files bounced from Logic and burned onto CD will no longer contain white noise artifacts.
- When the progress window hint: "Press Cmd-Period to abort" appears, the key command now works as expected.
- Logic Express can now use the 17 PowerBook line-in as an input for audio recording.
- When Autodrop is enabled during recording, the Record button now correctly flashes while the song position is outside the locators to indicate that no recording is taking place.
- The error message, "Specified volume doesn´t exist. Error Code = -35" no longer appears when a forward slash is used in the filename.
- The Undo History now correctly reflects dragging a file from the Project Manager to the Audio window.
- Dragging MIDI files with the file type MooV onto the Logic application icon will no longer cause Logic to quit unexpectedly.
- Logic"s Transport bar now displays the Preference Display tempo as BPM without decimals properly.
- The SMPTE Offset setting (Song Settings > Synchronization > General > Bar Position X plays at SMPTE Y) now correctly retains its value when changing tempo values.
- Logic no longer transposes MIDI notes down by one semitone when being used with SoundDiver and WaveBurner.

Control Surface Support

- Pressing the "Assign:Track" button on a Mackie Control surface with no song open no longer causes Logic to quit unexpectedly.
- Logic now correctly updates the Mackie Control surface display when Bass Amp parameters have been changed using the mouse.
- Punch in and out now functions correctly when using the Frontier Designs TranzPort control surface.
- Logic now correctly handles envelope recording in Sculpture when using an external controller.

QuickTime Movie Support

- Non-floating movies no longer disable the use of the "Enter" or " 0" keys on the numeric keypad.
- Logic now manages the selection of Digital Cinema Desktop better by disallowing the selection of DCD on the main window, thereby preventing the selector from becoming hidden, making it difficult to subsequently disable DCD playback.
- Exporting Audio To Movie no longer creates an extraneous 4KB File containing no audio.
- Movies with the DV format are now recognized by the Project Manager.
- A warning alert dialog will no longer incorrectly appear when selecting Digital Cinema Desktop as the output with a movie using a codec other than HD 1080i/p uncompressed.
- Logic can now recognize and playback MPEG4 and H.264 movie files that have the associated .m4v file extension.

ReWire

- ReWire streams will no longer drop out temporarily at the beginning of Cycle playback when an Audio Instrument with a tempo synced LFO is assigned to the selected track.
- Logic will no longer quit unexpectedly when inadvertently quitting Ableton Live 5 without first confirming Logic"s dialog which states "Quit ReWire Slave Application first".

Environment

- Patch names are now correctly pasted into the currently selected Bank when using the Paste All Names command to paste patch names into a Multi Instrument.
- Object icons changed in the Environment window now correctly update in the Arrange window.
- New Audio Objects now default to a channel strip view within the Environment.

Tempo List Editor

- The position marker in the Tempo List no longer disappears when resizing the window.

- New tempo events in the Tempo List editor no longer disappear when double-clicking on the bar position text field.

Key Commands

- The Escape Key, which functions as Cancel in many windows, now cancels the Strip Silence window.
- The key command for "Set Locators by Marker" now behaves correctly when the Global Marker track is visible and a Marker is selected.

Published Date: Oct 7, 2016

Logic Pro/Express 7.2.1 Enhancements

This article has been archived and is no longer updated by Apple.

Logic Pro and Logic Express 7.2.1 are maintenance releases that address isolated reliability and compatibility issues. This document lists the enhancements and fixes that have been incorporated between version 7.2 and 7.2.1 and which are not documented in the 7.2.1 versions of software update text, Late Breaking News About Logic Pro, or the Late Breaking News About Logic Express.

Arrange Window

- Using the "Snip/Cut time and move by locators" command on a single MIDI track no longer moves unselected audio files in Logic.
- When editing MIDI Regions in any editor, the Region content now updates in the Arrange as expected.
- The "Analyze," (transient mapping) function in the Beat Mapping Global track has been further improved to reduce the potential detection of extraneous transients.
- With Global Tracks enabled, Logic no longer exhibits Song Position Line redraw errors when using the Zoom tool.
- When importing a file from within a Folder track, in cases where the Song Position Line is positioned before the start of a Folder's boundaries, the imported file is now placed at the start of the Folder on the selected track.
- When lowering the tempo in a sequence with SMPTE locked regions, the locked regions now redraw correctly.

Intel-based Macintosh specific:

- Selecting the "Utilize Notes" option in the Chord Track options pane will no longer cause Logic to stop responding when running on an Intel-based Macintosh.

Track Based Automation

- An incorrect first node is no longer written when automating Channel Strip Mutes.
- Sample accurate automation in the Arrange has been improved with a 10 ms smoothing curve.
- Track Automation data will no longer be inadvertently entered under certain circumstances.
- Touch Automation mode will now continue to function properly on an Intel-based Mac even after overwriting existing automation data.
- The "Move all track automation to Region" command now works correctly on Audio Regions when Hyper Draw is not visible.

Software Instrument Plug-ins

- Audio instruments in Logic have been modified to prevent an unexplained loss of audio, even while channel strip meters indicate that MIDI is being received and signal should be present.
- Double-clicking the Import button in Ultrabeat has been corrected to bring up only one file selector window.
- When dragging a sample onto the Osc 2 sample window on the Ultrabeat, the GUI now correctly updates the name.
- Ultrabeat now changes the search path for finding missing sample files to the last directory manually selected by the user to locate a missing file.
- The Morph step mode on the EVB3 now always toggles between the different presets as expected.

Intel-based Macintosh specific:

- Logic will no longer quit unexpectedly on Intel-based Macs when loading certain EXS instruments from the Vienna Symphonic Library.
- On Intel-based Macs, Ultrabeat now correctly imports and loads the the samples of a .pst Ultrabeat Kit, when using the Import button.
- All samples loaded at once into EXS editor will play as expected when using an Intel-based Mac.

Effects Plug-Ins

- Logic now copies Tape Delay feedback automation correctly when Option-dragging the Region and selecting "Copy" in the dialog.
- The Enhanced Timing plug-in no longer resets its intensity level to 0 when changing the note grid resolution in the Arrange window.
- The tempo of the Tape Delay, when Sync is set to off, now remains unchanged regardless of changes to the song tempo.
- The margin reset feature of the Level Meter Plug-in now resets the display with mono signals correctly.
- Logic now correctly implements the "Look Ahead" feature in the Ducker plug-in.
- Inserting the stereo Rotor Cabinet plug-in on a mono Instrument track will no longer cause feedback or distortion under certain circumstances.
- Waves AU plug-ins settings are now correctly retained when closing and re-opening a song.
- Parameter values for certain plug-ins, Silver Compressor and Expander for example, will now load correctly when moving from a 7.1.1 to 7.2.1 session.
- SoundToys TDM plug-ins now appear in the Sample Editor Audio Suite menu as expected.
- Logic Pro 7.2.1 now has improved latency compensation for processor hungry Audio Unit plug-ins, allowing timing related plug-in modulations to happen in sync with timeline events.

Intel-based Macintosh specific:

- On Intel-based Macs, the Match EQ "Load template spectrum from setting..." now works as expected.
- Logic will no longer stop responding when assigning Stylus RMX output 13-14 as the input for an Aux while running on an Intel-based Mac.

Apple Loops

- Apple Loops are no longer removed from the installed directory when saving a Song as a Project with "Audio files : Move" selected.
- Logic no longer quits unexpectedly when "Add To Apple Loops Library" is selected, and everything in the field "Instrument Descriptors" is de-selected by clicking on the empty space below "Woodwind".
- Apple Loops that are added via the "Add Region to Apple Loops Library" command now have "Type" and "Scale" attributes as a selection.

Matrix Editor

- In the Multiple Region View of Matrix Editor, the following commands, "Select Overlapped", "Select Muted", "Select Similar", "Select Equal" and "Select Equal Subposition" now execute their functions correctly.

Score Editor

- In the Score Editor, when the display grid is set to 1/8 notes or finer, note beams are drawn with greater resolution.
- In the Score Editor, after entering lyrics, the TAB key now correctly moves the cursor to the next note, rather than defaulting to the cursor.

Track Mixer

- Logic Express 7.2.1 now has 12 busses, allowing GarageBand 3 songs to be imported and played without output reassignment.
- The Solo button on channel strips is now available for automation in Preferences > Control Surfaces > Learn Assignment.
- The Track Mixer global mode can now be toggled with the key command "Toggle Global Switch"
- Setting the track output to a bus now works as expected in Logic Express when using multiple I/O sound cards that provide more than eight outputs.

File Management

- A condition on certain systems that caused Logic to quit unexpectedly when performing a bounce has now been corrected.
- Importing an OMF file exported from Final Cut Pro has been improved and now works as expected.
- When converting files to Apple Lossless via menu command Audio File -> Copy/Convert Files, the resulting files are now the proper length instead of approximately 500 samples short.
- Logic now supports dragging songs directly from iTunes to the Arrange window.
- Converting a Region of a split stereo file to a "new audio file" no longer leads to unwanted replacement of other Regions.
- Stereo-interleaved MP3 and AAC files can now be successfully imported into Split-Stereo based songs.
- In the Bounce window, selecting Burn now behaves as expected, even when the original file source is 24 bit/44k, 24 Bit/48K or 16 Bit/48K.
- Logic now correctly handles MP3 files bounced from sessions with a 48Khz sample rate, correcting an earlier condition that converted MP3s to 44.1 Khz with a longer running time.
- It is now possible to choose "Add All" for Audio import in the "Add Audiofile" window or the EXS Instrument Editor, even when that selection contains .wav files that have the less common capitalized suffix (i.e. .WAV).
- Logic Pro now supports filename lengths of 21 characters and up to 10 characters for the extension suffix.
- Logic now executes the "'Move File" command from the Audio Window on a .mp4 file without changing the bit-rate or increasing its file size.
- Exporting and re-importing OMF files from Logic now no longer contain unwanted noise artifacts.
- Logic 7.2.1 should no longer sometimes create duplicate, oddly numbered, files when performing bounces.

Intel-based Macintosh specific:

- Improved compatibility when importing Logic 4 based song files on Intel-based Macs.
- ReCycle file support is now available on Intel-based Macs.
- ReCycle files Copy/Pasted from ReCycle into the Arrange window on an Intel-based Mac will now properly convert the file to an Apple Loop if that option is selected after the Paste command.
- Due to optimized handling of fade files, Intel-based Mac no longer receive the following error: "File is busy; one or more files are open. Result code = -47", followed by an Error Message "Fade Update failed. (Error -47)."

General

- Logic now prevents the computer from going to sleep during recording when Automatic Sleep is enabled as an Energy Saver Preference pane.
- The Audio MIDI Setup utility now properly retains the Emagic A2|6 or A6|2 audio interface bit depth settings when opening Logic Pro.
- Re-enabling the Core Audio Driver during playback will no longer cause Logic to quit unexpectedly.

- When the XSkey is removed on certain systems, Logic now displays an alert as expected, rather than quitting unexpectedly.
- The version number now correctly updates in the Finder after Installing Logic Pro 7.1.1 or Logic Express 7.1.1 in localized languages.
- Networked computers using Logic Express no longer experience Read/Write Permission errors when accessing the local home folders.
- Numerical input in the Transform Editor has been improved to eliminate an unexpected digit shift to the right.
- In the localized Japanese version of Logic, Click-holding a Marker in the Global Tracks view correctly updates the Help Tag.
- The Sample Edit window no longer opens with an empty screen, because of improvements made with the way Logic manages virtual memory.
- Logic no longer quits unexpectedly on launch when the International Preference Pane has been set to a language that the Finder is not localized for (such as Icelandic, Russian, Polish, etc).

Intel-based Macintosh specific:

- Exporting and re-importing MIDI-Regions now works as expected on Intel-based Mac.
- Changing the sample rate in Logic from 44.1 Khz to 88.2 Khz/96 Khz and back to 44.1 Khz no longer adversely affects the Core Audio driver when running on an Intel-based Mac.

Control Surface Support

- Mute LEDs are now consistently displayed correctly on the Mackie Control.
- The Mackie C4 now displays the correct characters when changing format parameters.
- Mackie Control and Mackie C4 now update as expected when shifting to Channel Strip view.
- Mackie C4 assignments for Next/Previous Setting now execute the function as expected.
- Mackie/Logic Control or XT Fader for Audio Track 1 will now consistently stay at its set position, even if the Arrange window contains less than 8 audio tracks.
- Track Left and Right buttons on a Mackie C4 Control surface now function properly when in Multi-Channel view.
- Changing the Control Surface Group parameter in the Controller Assignment window will no longer cause Logic to stop responding.
- Activating a MIDI controller on a G5/Quad or other Dual Core machines, using the "Learn Assignment" command now works correctly in Logic.

Intel-based Macintosh specific:

- The control surface preference file (~/Library/Preferences/Logic/com.apple.logic.pro.cs) is now compatible between PPC and Intel-based Macs.

QuickTime Movie Support

- Logic no longer creates a an empty .aif file artifact in the Finder when extracting audio from a muxxed movie file (audio and video mixed on the same channel) and clicking OK to the resulting "No Extractable Audio tracks found" dialog.
- The "Detect Cuts" command for Intel-based Macs has been improved so that it no longer potentially causes the system to unexpectedly quit when used with .mp4 files.

Logic Node

- Logic Nodes now retain their status when using multiple ethernet cards in one machine.

Intel-based Macintosh specific:

- Node operations initiated between Intel-based and PPC Macs no longer emit a short burst of white noise on playback.
- Audio no longer drops out under certain conditions when enabling Node tracks on an Intel-based Mac.
- Improved Logic Node compatibility with Intel-based Mac mini computers.
- A short noise burst will no longer be emitted in some cases when using a Mac mini Core Solo as a Logic Node.

Environment Window

- Logic now correctly deletes Environment layers, rather than leaving an unnamed layer in the Layer list.
- The Transformer Object window in the Environment now correctly displays "-1-" and "-2-" for the processing columns as opposed to showing two columns of "-1-".
- The Environment Vector object no longer creates graphic glitches when values are changed.

Intel-based Macintosh specific:

- Touchtrack region assignments made in a song on a PPC based machine are no longer lost when opening the song on an Intel-based Mac.

Key Commands

- Assigning Transport controls to notes on a MIDI keyboard in the Key Commands window now works correctly.

- In the Key Command window, a safety alert now appears when the user attempts to overwrite a global key Command.

Aperture: Cannot select root level of disk when importing images

This article has been archived and is no longer updated by Apple.

If you're importing images from an external disk and you select a folder on that disk, it may seem like you aren't able to subsequently navigate back up to the root level of that disk. However, you can, using different navigation path within the Import window.

The reason it seems this way is that Aperture remembers the last used path for an external disk when you select it by clicking its icon. In this picture, for example, Aperture remembers that the user imported from the folder "Stuff" the last time she imported from the disk "Aperture":

In this situation, clicking the icon for the disk Aperture in the Import panel simply toggles the Import dialog.

To get the desired effect, navigate to the external disk via the Local Files icon in the Import panel, like this:

Using this method, you can quickly navigate back to the root of the disk.

Server Admin may display incorrect Time Zone Information

This article has been archived and is no longer updated by Apple.

Under certain circumstances, the Time Zone panel of Server Admin may show a different time zone than what appears in System Preferences.

This issue occurs in Mac OS X Server 10.3 and later.

Solution

In Server Admin, under Settings, set the time zone to match what is displayed in System Preferences.

Mac OS X Server 10.4: How to publish a podcast using the server‘s weblog feature

This article has been archived and is no longer updated by Apple.

You can publish a podcast using Mac OS X Server's built-in weblog feature. Just follow these steps:

1. Connect to your weblog server at:

   ```
   http://serveraddress:port/weblog/
   ```

2. Log in with your account's short name and password.
3. Click New Entry.
4. Type in a title and description.
5. Click Advanced.
6. Click the podcast Choose File button.
7. Select the podcast, and click the Choose button.
8. Click Save.

To subscribe to the podcast, follow these steps:

1. In iTunes, choose **Advanced > Subscribe to Podcast...** .
2. Enter the URL to your weblog in this format:

   ```
   http://serveraddress:port/weblog/usershostname/?flavor=rss2
   ```

   For example, if your server address is www.demo.edu, running on port 80, and your user account's short name is "joe," you would enter this URL:

   ```
   http://www.demo.edu/weblog/joe/?flavor=rss2
   ```

Mac OS X Server 10.4 or later: How to store Software Update packages on another hard disk or partition

This article has been archived and is no longer updated by Apple.

The Software Update service stores its package files in a static location at:

```
/usr/share/swupd/html
```

These files can take up gigabytes of hard disk space. If you want to save space on the system volume by storing the updates on a different volume, it's possible to use a symbolic link to point a location where packages reside on another volume.

Note: If you have previously enabled the software update service, you need to delete the existing `/usr/share/swupd/html` folder before creating the symbolic link. For more information on creating symbolic links, see the ln man page.

For example, if you had a volume named "ScratchDisk" where you want to store the updates, you could create a symbolic link to it with this Terminal command:

```
sudo ln -s /Volumes/ScratchDisk /usr/share/swupd/html
```

Mac OS X: Dial-up connection (PPP) fails to automatically disconnect

This article has been archived and is no longer updated by Apple.

Sometimes Mac OS X may not seem to respect the automatic disconnect setting that is defined in System Preferences (which is 10 minutes of inactivity by default).

The reason is that unsolicited, inbound traffic from the Internet, usually caused by others' attempts to attack to your computer, can "tickle" the 10 minute timer, causing it to reset.

You can have your Mac ignore this unsolicited traffic by using Stealth mode. Follow these steps:

1. From the **Apple** menu, choose **System Preferences**.
2. Select the Sharing preference.
3. Click the Firewall tab.
4. Click the Advanced button.
5. Select the checkbox for Enable Stealth Mode.
6. Click OK.

Mac OS X: Resolving login issues with Active Directory plug-in

This article has been archived and is no longer updated by Apple.

You can resolve some Active Directory Plug-in login issues, in which the computer becomes unresponsive ("hangs") at the blue progress bar, by changing the startup parameters for automount.

Warning: If you are unfamiliar with command-line interface and manual configuration in general, you should be cautious or seek assistance. Due to the advanced nature of this procedure, the complimentary support included with new Apple products does not cover this procedure. However, fee-based support is available through Apple Professional Services (http://www.apple.com/services/). If you do not follow these steps precisely, the script may not work, which could prevent the computer from starting up normally.

1. Make sure you are logged in with an administrator account.
2. Open Terminal (/Applications/Utilities).
3. Create a backup of the current NFS Startup script with this command on a single line:

   ```
   sudo cp /System/Library/StartupItems/NFS/NFS /System/Library/StartupItems/NFS/NFS.bak
   ```

4. Open the NFS Startup Item script for editing with pico by using this command:

   ```
   sudo pico /System/Library/StartupItems/NFS/NFS
   ```

5. To locate the section of the script that starts automount, press Control-W, type "automounter", and press Return.
6. Under the section "Start the automounter," change the line that reads:

   ```
   automount -m /Network -nsl -mnt ${AUTOMOUNTDIR}
   ```

   to read:

   ```
   automount -1 -m /Network -nsl -mnt ${AUTOMOUNTDIR}
   ```

7. Change the line that reads:

   ```
   automount -m /automount/Servers -fstab -mnt /private/Network/Servers \\
   ```

   to read:

   ```
   automount -1 -m /automount/Servers -fstab -mnt /private/Network/Servers \\
   ```

8. Save the file (Control-O, Return), and exit pico (Control-X).
9. Reboot.

iSync 2.3: About using a Motorola Razr V3x phone

This article has been archived and is no longer updated by Apple.

iSync 2.3, included with Mac OS X 10.4.7, lets you sync with Motorola Razr V3x phones, as well as many others.

The following behaviors are expected when syncing a Motorola Razr V3x with iSync 2.3 or later:

- The Motorola Razr V3x may not sync reliably if Datebook is running on the phone. On the phone, close the Datebook application. If syncing problems continue, turn the phone off and back on.

- Motorola Razr V3x email addresses may sync to the Mac OS X Address Book application as Work addresses. A feature of the Motorola V3x phone is the ability to create phone contacts with different types of email addresses, such as home or work. However, when you sync these contacts to Address Book, all emails will appear as Work email addresses. After they have been synced to Address Book, you can find the contact in Address Book and change the email address type if desired.

- If a contact in Address Book has more than two email addresses, the additional email addresses (third, and so forth) will sync to the phone as an additional contact or contacts. This happens because the Motorla V3x phone allows for a maximum of two email addresses per contact record.

- If your sync via USB does not complete sometimes, try the sync again.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Feb 20, 2012

iSync: Some Sony Ericsson phones may show birthday value of 01/00/00 if you remove the birthday information from Address Book

This article has been archived and is no longer updated by Apple.

Address Book allows you to enter birthday information for each contact. Some Sony Ericsson phones show this information. If you later delete the birthday information in Address Book and sync the contact to your phone via iSync, some phones will correctly delete the birthday information. However, the birthday data may be replaced with 01/00/00.

Solution

If your phone replaces the birthday data with 01/00/00, delete the birthday information on the phone instead of Address Book.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Apple Remote Desktop 3: About encrypted communication

This article has been archived and is no longer updated by Apple.

When using the Remote Desktop 3 application to connect to an Apple Remote Desktop 3 (ARD) client, most of the communication is encrypted.

Authentication

Authentication to Apple Remote Desktop clients uses an authentication method based on a Diffie-Hellman Key agreement protocol that creates a shared 128-bit key. This shared key is used to encrypt both the name and password using the Advanced Encryption Standard (AES). The Diffie-Hellman key agreement protocol used in Remote Desktop 3 is very similar to the one used in personal file sharing, with both of them using a 512-bit prime for the shared key calculation.

Administration

With Remote Desktop 3, keystrokes and mouse events are encrypted when you control Mac OS X client computers. Additionally, most tasks (except Control and Observe screen data), files copied via Copy Items, and Install Packages are encrypted for transit (though you may choose to encrypt these as well by changing your application preferences). This information is encrypted using the Advanced Encryption Standard (AES) with the 128-bit shared key that was derived during authentication.

The following tasks do not support encrypted communication:

- Wake computers
- Upgrade Client Software
- Share Screen

Encrypting Observe and Control Network Data

Although Remote Desktop sends authentication information, keystrokes, and management commands encrypted by default, you may want additional security. You can choose to encrypt all Observe and Control traffic, at a certain performance cost.

Encryption is done using an SSH tunnel between the participating computers. In order to use encryption for Observe and Control tasks, the target computers must have SSH enabled (“Remote Login﷒? in the computer’s Sharing Preference pane). Additionally, firewalls between the participating computers must be configured to pass traffic on TCP port 22 (SSH well known port).

If the you are trying to control a VNC server which is not Remote Desktop, it will not support Remote Desktop keystroke encryption. If you try to control that VNC server, you will get a warning that the keystrokes aren’t encrypted, which you will have to acknowledge before you can control the VNC server. If you chose to encrypt all network data, then you will not be able to control the VNC server, because Remote Desktop is not able to open the necessary SSH tunnel to the VNC server.

If you drag and drop files when Controlling a client computer, the file copy will be encrypted if the screen sharing is encrypted, or if the option "Encrypt network data when using Copy Items" is selected in the Preferences.

Final Cut Pro: How to edit audio nondestructively

This article has been archived and is no longer updated by Apple.

When you send audio from a Final Cut Pro sequence to a Soundtrack Pro script, any edits performed by the script are destructive —in other words your media files on the hard drive will be permanently changed.

A good way to edit audio from Final Cut without destructively altering your source files is to send the audio to a Soundtrack Pro audio file project first. This will replace the audio clip in your Final Cut Timeline with a Soundtrack Pro audio file project, which can be nondestructively edited.

To do this, control-click the audio clip you'd like to edit, and from the shortcut menu choose **Send To > Soundtrack Pro audio file project**. Soundtrack Pro will open and create an audio file project based on the audio clip. Now, you may either perform your edits in Soundtrack Pro or apply a Soundtrack Pro script to the clip nondestructively from the Final Cut Pro Timeline.

Mac OS X Server 10.4: Unable to configure NAT using a PPPoE interface

This article has been archived and is no longer updated by Apple.

You cannot configure network address translation (NAT) in Mac OS X Server when the primary Internet connection uses PPPoE, because the PPPoE network interface will not appear in the “External network interface﷯? pop-up menu in Server Admin (located at Computers & Services > NAT > Settings).

Solution

To work around this issue, you need a DSL modem that negotiates the PPPoE authentication itself, rather than configuring the server to do so. After making the PPPoE connection, the modem passes the IP address to the server via DHCP.

From the server's perspective, it will then operate as a standard Ethernet connection, and the network interface to which the modem-negotiated IP address is assigned will be available as the external network interface when configuring NAT.

The ability of a modem to operate in this manner is sometimes known as "half-bridge mode" or "DHCP spoofing."

Note: You must work with your Internet Service Provider to ensure that the server's DSL line has a static IP address. (Mac OS X Server requires a static IP address regardless of the issue discussed in this document.)

LaserWriter 8500: Arial Font substitution issue

Some users have reported that when printing to the LaserWriter 8500, using the Arial typeface, the printout is instead substituting Courier for the final output.
This article has been archived and is no longer updated by Apple.

Mac OS 9

Some Arial characters such as quote, apostrophe, and option-space may not print correctly on a LaserWriter 8500 under Mac OS 9. This occurs only with certain applications. To work around the issue, first navigate to the Font Settings panel using the pulldown menu within the Print dialog box. Then select the "Always download needed fonts" option. You can make this setting the default by clicking the "Save Settings" button.

Font Settings panel of the Print dialog box.

Windows NT

Apple has confirmed this issue with printing Arial to a LaserWriter 8500 from Windows NT. This issue is not expected to be addressed. Apple recommends substituting an equivalent PPD in order to print using the Arial typeface.

If you need to print to the LaserWriter 8500 from Windows NT using the Arial typeface utilize the following PPDs:

- use the LW8500 PPD as the default for normal use
- use the Pro 810 PPD for tabloid printing when printing with Arial
- use the 12/640 PPD for duplex printing when printing with Arial

Many applications will allow you to specify which printer to send a job to. You should consider setting up all three printers (one for each setting) assigned to the LaserWriter 8500 and in turn name them accordingly (such as "normal", "tabloid" and "duplex") so that you can easily switch between setups depending on what your output requires.

Bluetooth Firmware Update 1.2.1: What to do if update won‘t finish

This article has been archived and is no longer updated by Apple.

Under certain circumstances, Bluetooth Firmware Updater 1.2.1 may not install successfully on the first attempt.

If that happens to you, it is important to **shut down** the computer. A **restart** is not sufficient, because the computer must be powered off, which doesn't happen during a restart.

After the shutdown, power the computer on again and run the Bluetooth Firmware Updater again.

Logic Pro songs sound different when played in Logic Express

This article has been archived and is no longer updated by Apple.

Songs created in Logic Pro that contain Logic Pro Instrument tracks may sound different when played in Logic Express.

This happens because Logic Express will substitute a similar GarageBand Instrument for the Logic Pro Instrument (for example, an EVD6 track will be assigned to the GarageBand Clavinet), and the sound settings from the Logic Pro Instrument may not carry over. The degree of disparity varies according to what Instruments or Plug-ins are being used to create the song in Logic Pro.

Conversely, songs created in Logic Express and then opened in Logic Pro will always sound the same.

Mac OS X Server: New users see question marks in the Dock

This article has been archived and is no longer updated by Apple.

A new user with a server-based home directory may see question marks in her Dock.

This happens because Mac OS X Server uses default Mac OS X settings when creating new user home directories on the server. These default Dock contents include links to applications such as iMovie and iPhoto. If those applications are not present on the client computer, the links to them will appear as question marks in the new user's Dock.

GarageBand: Double-byte characters appear incorrectly in imported podcast tracks

This article has been archived and is no longer updated by Apple.

Double-byte characters (such as those in Japanese) in podcast chapter markers display incorrectly when imported into GarageBand 3.

Solution

This issue only occurs with imported tracks, not during export. To work around this issue, replace the affected characters with the correct ones before exporting the podcast.

This document will be updated as more information becomes available.

iMac (17-inch Mid 2006) starts up to black screen or no video

This article has been archived and is no longer updated by Apple.

An iMac (17-inch Mid 2006) may start up to a black screen (with no video). It may also occur if you have just changed the brightness of the display. If this happens, the computer will sound like it's starting up, but the display stays black. In this case, if you hold down the power key to shut the computer down and then try to start it up again, the situation would not be resolved.

If this occurs, follow the steps below—the first steps are to regain normal operation, and the second set of steps are to prevent the issue from happening again.

Get video back

1. Shut down the computer by pressing and holding the power button on the back of the iMac until it turns off.
2. Reset the NVRAM. The computer should display a grey screen, then start normally.

Prevent it from happening again

1. From the Apple menu, choose Software Update...
2. Make sure the Mac OS X 10.4.8 system software update is selected, and install it. The update will require that you restart your computer after installing.
   An alternative to Software Update is to download the Update from Apple Software Downloads (http://www.apple.com/support/downloads/).

Note: If you choose not to install the Mac OS X 10.4.8 software update, the following steps will also prevent the issue from occurring again:

1. From the Apple menu, choose System Preferences.
2. Choose the Displays pane of System Preferences.
3. Temporarily select a resolution other than the 1440 x 900 native resolution.
4. Switch back to your preferred resolution and close System Preferences.

Published Date: Oct 7, 2016

Mac OS X 10.3 or later: Can‘t log into AFP servers using SSH connection

This article has been archived and is no longer updated by Apple.

When you try to make a secure AFP connection, you may receive this alert message:

> "Cannot make a secure connection to "<Server>"
>
> Secure connection failed. Please contact your server administrator. To connect with reduced security, click Continue.

Solution

In the Terminal, execute this command:

```
ssh username@hostname
```

If the response is:

```
ssh: connect to host hostname port 22: Operation timed out
```

... then SSH is most likely not enabled on the server, or the server is in sleep mode.

If the response is:

```
The authenticity of host 'hostname (xxx.xxx.xxx.xxx)' can't be established. RSA key fingerprint is
fa:71:73:98:bd:05:bb:7c:07:b6:55:8f:2f:1b:b0:da. Are you sure you want to continue connecting (yes/no)?
```

... then the host key is not known. Just type yes, and continue.

If the response is:

```
@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@
@    WARNING: REMOTE HOST IDENTIFICATION HAS CHANGED!     @
@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@
IT IS POSSIBLE THAT SOMEONE IS DOING SOMETHING NASTY!
Someone could be eavesdropping on you right now (man-in-the-middle attack)!
It is also possible that the RSA host key has just been changed.
The fingerprint for the RSA key sent by the remote host is
7a:43:4e:40:b2:e0:be:f8:00:99:38:b8:dc:72:e5:02.
Please contact your system administrator.
Add correct host key in .ssh/known_hosts to get rid of this message.
Offending key in .ssh/known_hosts:1
RSA host key for hostname has changed and you have requested strict checking.
Host key verification failed.
```

... then the host key does not match the one previously saved. You may want to edit your known_hosts file. But be sure that the server really has changed its key (most common during reinstallation/upgrading).

To learn more, execute

```
man ssh
```

in Terminal.

Mac OS X Server: Controlling kernel parameter settings

This article has been archived and is no longer updated by Apple.

Starting with Mac OS X Server 10.3, config files control certain sysctl/kernel parameters, such as the maximum number of processes, maximum number of open files, and so forth. Apple installs one config file to specify settings that differ between Mac OS X and Mac OS X Server:

```
/etc/sysctl-macosxserver.conf
```

If you want to override any of these settings, you should read the instructions contained in that file, but do not modify that actual file. Instead, put the settings you want to change in a new file at this pathname:

```
/etc/sysctl.conf
```

The new file bearing this name will be processed after the Apple-provided one, and your settings will thus take precedence. For more details about what settings are available, see the man page for sysctl(8).

Final Cut Express: Troubleshooting Basics

If Final Cut Express isn't starting up properly or performing normally, try these basic troubleshooting steps to remedy the situation. Please note that these steps aren't exhaustive and are not intended to cover any specific issue. They are fundamental, basic steps that are most effective in getting Final Cut Express into good working order, and are the steps most often suggested by AppleCare Technical Support.

This article has been archived and is no longer updated by Apple.

Confirm requirements and versions

1. **Check system requirements**
   Make sure that you haven't overlooked any hardware aspect that's required to use Final Cut Express. You can view the system requirements on the Final Cut Express Technical Specifications page.

2. **Update to the latest software versions**
   Choose **Apple > Software Update** and make sure that you have the most recent updates for your versions of Final Cut Express, QuickTime, and other important system files. Installing the latest updates ensures that your software has the latest improvements and enhancements.

3. **Check compatibility and driver versions for third-party devices**
   If you're using a third-party storage system, input device, or something else, check the support area on the manufacturer's website to be sure that you're using the latest version of the relevant driver or other software for your device, if necessary. To see if your video device has been qualified for use with Final Cut Express, review: Final Cut Express: Camcorder support.

Delete the User Preferences

You can resolve many issues by restoring Final Cut Express back to its original settings. This will not impact your project files, but you should verify your Scratch Disk location setting after doing this. To reset your Final Cut Express user preference settings to their original state, do the following:

1. In the Finder, go to ~/Library/Preferences
   Note: The tilde (~) represents your Home folder.
2. Remove the "com.apple.finalcutexpress.plist" file from the Preferences folder.
3. Remove the "Final Cut Express User Data" folder from the Preferences folder.

Final Cut Express

Another approach you might consider is reinstalling Final Cut Express. To do this effectively, you need to remove the application then install Final Cut Express and use Software Update to install additional updates. You don't have to remove everything that was installed with Final Cut Express. Follow the steps below to completely reinstall a fresh copy of Final Cut Express.

Note: Make sure that you have your installation discs handy before starting this.

On Mac OS X v10.5

1. Open the Applications folder. Drag the Final Cut Express application to the Trash.
2. Go to `/Library/Receipts`.
3. In the Receipts folder, select the `FinalCutExpress.pkg` file.
4. Choose **View > as List** to view the contents in a list.
5. Click the Date Modified column header so you can easily see all of the receipts that were installed at the same time as Final Cut Express.
6. Drag the FinalCutExpress.pkg receipt to the Trash, as well as any other items that have the same modification date within 3 minutes of the FinalCutExpress.pkg's modification date.
7. Click the Name column header to sort the list alphabetically.
8. Drag any other receipts whose names begin with "Final Cut Express" to the Trash.
9. Insert your Final Cut Express installation disc and install Final Cut Express.
10. When finished, choose **Software Update** from the **Apple** (□) menu to update your software to the latest version.

On Mac OS X v10.6

1. Open the Applications folder. Drag the Final Cut Express application to the Trash.
2. Insert your Final Cut Express installation disc and install FInal Cut Express.
3. When finished, choose **Software Update** from the **Apple** (□) menu to update your software to the latest version.

For further information on settings or installation, please refer to the Final Cut Express documentation available on your installation discs.

Mac OS X 10.4.6 or later: AFP share points may mount as read only

This article has been archived and is no longer updated by Apple.

After updating to Mac OS X 10.4.6 or later, Apple File Service (AFP) share points from Mac OS X 10.3.9 servers may be mounted read only.

This can occur if the volume originated from an AppleShare IP migration, and the AppleShare IP administrator had selected the "Can't move, rename, or delete this item (locked)" option, which set the user immutable flag on the share point. The AFP client in Mac OS X 10.4 to 10.4.5 ignored this flag, but that is no longer the case, so some share points may appear read only.

Solution

To change the Finder flags using a 10.4.6 or later client:

1. Log into the AFP server as the owner of that share point.
2. In the Terminal, execute the command `cd /Directory`, where `Directory` is the location of the share point.
3. Execute `ls -lo`, and you will see that the "uchg" flag is set on the share point, indicating that it is immutable. For example:

```
server:/Shared Items admin$ ls -lo
total 112
drwxrwxr-x   2 root   admin  uchg 68 Sep  9  2005 Public
drwxr-xr-x   2 admin  admin  -    68 Jun  5 14:02 Public2
server:/Shared Items admin$
```

4. Execute: `sudo chflags nouchg sharepointName`
5. Execute `ls -lo` again to verify that the "uchg" flag is now cleared.

Remote Desktop 3.0: Some reports appear blank or respond with an error message

This article has been archived and is no longer updated by Apple.

When you try to generate a report for User History or Application Usage, Remote Desktop 3.0 may return a blank report or a "Failed on All" message.

Solution

1. Go to Preferences in the Remote Desktop application. For Task Server, be sure that the checkboxes for these items are selected:
   - Collect Application Usage data
   - Collect User Accounting Data
   - Upload report data to the Task Server on a schedule

2. In the Change Schedule window, be sure all the days are checked.
3. Select the client system in the Remote Desktop admin. Get Info on that client by choosing **File > Get Info** or pressing Command-I.
4. Click the Data Settings tab, and deselect "Upload on a schedule" (if selected), then reselect "Upload on a schedule."
5. Click the Use Default Schedule button.
6. When creating a report (Report->Application Usage, etc), verify that the date range is correct, as the end date defaults to yesterday, and click the checkbox for "Rebuild data for report" in order to refresh reporting information.

Note: Application Usage report information is not recorded until a running application is quit or another application is brought to the foreground.

This document will be updated as more information becomes available.

MacBook, MacBook Pro: Scheduled startup requires power cord to be plugged in

This article has been archived and is no longer updated by Apple.

If you set your MacBook or MacBook Pro to start up at a specified, scheduled time using the Energy Saver pane of System Preferences, you will need to make sure your computer is connected to the AC power adapter at the time it is scheduled to start up. The computer will only start up on schedule when connected to AC power. If the schedule start up time occurs and no AC adapter is connected, the computer will start up automatically when the AC adapter is connected.

DVD Studio Pro 4.1: Script Command Inspector doesn‘t open when system language is set to German

This article has been archived and is no longer updated by Apple.

The Script Inspector in DVD Studio Pro has two displays: A general Script Inspector that appears when no command lines in the script are selected and a Script Command Inspector that appears when you select a command line.

In the German version of DVD Studio Pro 4.1, the Script Command Inspector window does not open when you select a command line.

Solution

The only workaround currently is to change the system language or to force DVD Studio Pro to run in another language. To do this:

1. Select the DVD Studio Pro application in the Finder.
2. Choose **File > Get Info**.
3. Deselect German in the Languages section of the Info window.

Aperture: Color shift when in full screen mode

This article has been archived and is no longer updated by Apple.

If you are using a second display on a PowerBook G4 or MacBook Pro, you see a color shift on the second display when entering Full Screen mode.

Solution

To resolve the issue, make the external display your default display.

1. Open the Color Sync utility, located at /Applications/Utilities.
2. Click the Devices icon.
3. Click the disclosure triangle next to Displays.
4. Select your second display.
5. Click the Make Default button.

Using stereoscopic graphics in Mac OS X

This article has been archived and is no longer updated by Apple.

Stereoscopic graphics are supported through OpenGL in Mac OS X 10.4.3 or later. The following guidelines are recommended:

- A cathode ray tube (CRT) display capable of a 100Hz vertical refresh rate is required for full-screen and windowed stereo display modes. LCD displays are not supported.
- A graphics card that supports the vigorous demands necessary for stereoscopic 3D graphics must be used, such as an NVidia Quadro FX 4500 (PCI Express) card. **Note**: The NVIDIA Quadro FX 4500 requires both the 16-lane PCI Express graphics slot *and* an adjacent PCI Express slot.
- A stereo-enabled application that can use OpenGL stereo functions. You can search for applications here.
- Stereo goggles with a Mini-DIN connector are supported. In the event your video card does not have a VGA output, a DVI-to-VGA adapter can be used.

Stereoscopic graphics have been tested with a PowerPC G5 Quad 2.5GHz computer with optional NVidia Quadro FX 4500 video card installed.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Aperture: IPTC Metadata in TIFF images no longer appears on Intel-based Mac

This article has been archived and is no longer updated by Apple.

After you update to Mac OS X 10.4.7 on an Intel-based Mac, Aperture, Preview, and iPhoto will no longer display IPTC metadata for certain TIFF files. The affected TIFF files are those to which you added IPTC metadata in Aperture in Mac OS X 10.4.6 or earlier and then exported from Aperture as TIFF files.

The issue affects these products when used on an Intel-based Mac:

- Aperture 1.1
- Preview
- iPhoto 6
- Mac OS X 10.4.7

Solution

Re-export any affected images from Aperture after updating to Mac OS X 10.4.7.

iPhoto 6: Unable to import .jpe files

This article has been archived and is no longer updated by Apple.

When you try to import a .jpe file from the Finder into iPhoto 6, you may receive an alert message indicating that the file could not be imported because it is in an unrecognized format.

Additionally, iPhoto 6 may unexpectedly quit if you attempt to import a .jpe file directly from a digital camera or when you try to edit a .jpe file that you brought into your library prior to upgrading from an earlier version of iPhoto.

Solution

Files ending in the .jpe extension are JPEG formatted photos created by some digital cameras that contain an embedded color profile. In order for iPhoto 6 to properly recognize these files, you will need to update to iPhoto 6.0.4 or later. If you drag or drop a .jpe file onto the iPhoto window or icon in iPhoto 6.0.4, you may get an unrecognized format alert. Be sure the file name ends in .jpeg or .jpg.

Remote Desktop: Port priority affects which IP address can be used for ARD management functions

This article has been archived and is no longer updated by Apple.

If you have configured multihoming on an Apple Remote Desktop (ARD) client, the management feature is restricted to the primary IP address, which is determined by the port order in System Preferences. The Observe, Control, and Curtain features will work on all IP addresses regardless of priority.

If you try to manage the client via a secondary IP address, Remote Desktop will display the message "This task will fail."

This issue affects Remote Desktop 2.0 and later.

Solution

To avoid the issue, use the IP address with higher priority on multihomed ARD clients for management functions.

Network Install: Regional locale information does not match default language

This article has been archived and is no longer updated by Apple.

After using Network Image Utility to create an installation image with a specific default language, the default time zone and input menu settings set by the installer may be incorrect; they do not match the settings for your region.

This happens because Mac OS X sets Pacific (Cupertino, CA) as the default time zone location and the United States as the region format regardless of what the default language is selected for the network install.

Solution

For managed client users, the client will assume the same localized settings as the language Mac OS X Server was installed with. For unmanaged systems or other situations in which the locale needs to be set automatically, preconfigure a Mac OS X client with the desired locale and then create a Network Install image from that client system.

iTunes: Backup DVDs from my Mac don‘t work on my Windows PC

Audio CDs burned in iTunes and data DVDs burned using iTunes on a Mac may not be recognized when inserted into a Windows PC with Drag-to-Disc software installed. In some cases, the Drag-to-Disc software is installed as part of Roxio's Easy CD & DVD Creator suite.

This article has been archived and is no longer updated by Apple.

Follow the steps below to remove the Drag-to-Disc software. **Note:** If you ever need to reinstall Drag-to-Disc, you will need the original software disc.

1. Close all programs on your Windows PC.
2. Open the Add/Remove Programs Control Panel (Click Start and then click Control Panel. Open Add/Remove Programs.
3. Select Easy CD & DVD Creator in the list and click the Change button. **Note**: This may also be called "Easy CD Creator" or "Easy Media Creator."
4. When the Easy CD & DVD Creator Installshield Wizard screen appears, click Next.
5. Select the Modify option and then click Next.
6. In the Custom Setup screen, click the menu icon to the left of the "Drag-to-Disc" option and then click "This feature will not be available" so that the red "X" icon is showing and then click Next.
7. Click the Install button and the Drag-to-Disc software will be removed from your computer. When the process is complete, click the Finish button.
8. If you are prompted to restart your computer when the uninstallation has finished, select the option to restart. If you are not prompted to restart, please restart your machine from the "Start" menu
9. After restarting your computer, open iTunes and reinsert your iTunes data DVD or audio CD into your computer.

Mac OS X Server 10.4.7 resolves SMART reporting in Seagate Tonka drives

This article has been archived and is no longer updated by Apple.

If you installed 80GB or 500GB drives for your Apple Xserve or Xserve RAID (part number M9449G/A for the 80 GB Seagate Tonka drive and MA207G/A for the 500 GB Seagate Tonka drive), you'll need to apply the Mac OS X Server 10.4.7 Server Software Update to enable SMART support for these drives.

The 10.4.7 Server update can be found at http://www.apple.com/support/downloads/.

Logic does not recognize REX files

This article has been archived and is no longer updated by Apple.

Logic does not recognize ReCycle (REX) files if the required library is not installed.

Solution

The file "REX Shared Library" must be installed on your system. Prior to version 7.2, this file was installed as part of the Logic installation. You can download the installer from the Propellerheads web site.

Aperture: Self-printed PDF book appears to have extra blank page

This article has been archived and is no longer updated by Apple.

When you create a PDF file of an Aperture book, an extra blank page appears between the cover and and the first page in Aperture's book layout.

Solution

This is normal. The blank page represents the inside of the front cover. This page must be left blank, so it's not included in Aperture's book layout view. You don't need to alter the layout of your book to account for the extra page.

Power Macintosh G3: Read Me Clarification

There has been some confusion about a particular line in the Power Macintosh G3 Read Me which needs to be clarified.
This article has been archived and is no longer updated by Apple.
The G3 Read Me file states:

If you have Ethernet selected in the AppleTalk Control Panel, you should disconnect any LocalTalk cable. A software condition prevents having a LocalTalk cable connected to the computer if the AppleTalk Control Panel is not set to the Modem or Printer port. If you wish to switch between Ethernet and LocalTalk, you must disconnect the LocalTalk cable when you switch to Ethernet.

Based on this statement, some people have assumed that the LocalTalk Bridge is not compatible with the G3. This is not true. When the LocalTalk Bridge is running, AppleTalk is active on both the Ethernet and LocalTalk ports. The statement above applies only to the case where the computer is physically connected to a LocalTalk network but AppleTalk is not active on the LocalTalk port.

Note: The software condition mentioned in the Read Me has been fixed in Mac OS 8.1.

Boot Camp Beta: More than one firmware update might be required to use Boot Camp

This article has been archived and is no longer updated by Apple.

As mentioned in the Boot Camp Beta FAQ article, you should install the latest firmware updates available for your Intel-based Mac.

You might need to download and install more than one firmware update before you can use Boot Camp Beta depending on which Mac you have. For example, with an iMac (Early 2006), installing only the latest SMC firmware update may not be sufficient--the latest EFI firmware update may also required. Be sure to install all of the appropriate firmware updates for your computer. You can obtain the latest EFI and SMC updates for your Mac by visiting http://www.apple.com/support/downloads .

Final Cut Pro 5.1.1: Updating older projects to address duplicated frames in P2 media

This article has been archived and is no longer updated by Apple.

Final Cut Pro 5.1.1 resolves an issue in using the Import Panasonic P2 feature with 720p/24PN footage that can result in duplicate frames in rendered sequences. The issue does not occur with P2 media that is imported into Final Cut Pro 5.1.1. But the issue can still occur in Final Cut Pro 5.1.1 if the project contains 720p/24pn P2 media that was imported using an earlier version of Final Cut Pro 5.

Try one of the following methods to address the P2 media in such projects.

If the original P2 footage is still available, re-import clips using Final Cut Pro 5.1.1:

1. Open Final Cut Pro 5.1.1.
2. Create a new project and save it as "Temp" or something similar.
3. Choose **File > Import > Panasonic P2** and import the same clips from P2 card(s) as those used in the original project.
4. Quit Final Cut Pro. (Saving the "Temp" project at this point is not necessary.)
5. In Finder, navigate to your **Capture Scratch** folder and display window contents so that you can see the clips you just captured, as well as those in the original project.

The illustration above shows an example of how things might look at this point.

6. Select the clips in the Temp folder, and drag them to the folder for your project. For example, in the illustration above, you would drag the selected files to the folder named "MyProject_720p24pn".
7. Because that location already contains identically-named files, Finder will alert you.

8. Select the **Apply to all** checkbox, and then click **Replace** to replace all the original clips with the newly imported ones.
9. Open your original project in Final Cut Pro 5.1.1.
10. At this point, your timeline clips will be connected with their newer versions and should be online in the project.

11. Disable the track visibility button (highlighted in the image above) for each track that contains rendered items based on the P2 media. Click **Continue** to "unrender" the items in the track.
12. Click the track visibility button(s) back on.
13. Render the sequence.

If the original P2 footage is not still available, export clips from the Browser as new QuickTime movies:

Important: Back up your original clips before taking these steps. You should not need them, but the following steps will overwrite your original clips. In the event of a power failure or other accident, your footage could be lost permanently. Back up for safety!

1. Open the older project in Final Cut Pro 5.1.1 and select all the P2 clips in the Browser.
2. Choose **File > Batch Export**.
3. In the **Export Queue** window that opens, click **Settings**.
4. In the **Batch** window that opens, click **Set Destination**.
5. Navigate to the Capture Scratch folder, and then click the **New Folder** button.

6. Name the new folder "Temp" or something similar, and click **Create**.
7. In the **Choose a Folder** window, the new "Temp" folder should be highlighted. Click **Choose**.

8. Now the **Batch** window should look like the image above. Click **OK.**
9. Click **Export** in the **Export Queue** window, and Final Cut Pro will create new versions of your P2 clips in the "Temp" folder.
10. Quit Final Cut Pro.
11. In Finder, navigate to your **Capture Scratch** folder and display window contents so that you can see the clips you just exported, as well as those in the original project.

The illustration above shows an example of how things might look at this point.

12. Select the clips in the Temp folder, and drag them to the folder for your project. For example, in the illustration above, you would drag the selected files to the folder named "MyProject_720p24pn".
13. Because that location already contains identically-named files, Finder will alert you.

Select the **Apply to all** checkbox, and then click **Replace** to replace all the original clips with the newly created ones.

14. Open your original project in Final Cut Pro 5.1.1.
15. At this point, your timeline clips will be connected with their newer versions and should be online in the project.

16. Disable the track visibility button (highlighted in the image above) for each track that contains rendered items based on the P2 media. Click **Continue** to "unrender" the items in the track.
17. Click the track visibility button(s) back on.
18. Render the sequence.

iMovie HD 6: Theme drop zones play whole clip

This article has been archived and is no longer updated by Apple.

Symptom

When using themes in iMovie HD 6, you may find that clips you have shortened play in their entirety when placed in the theme's drop zone.

To work around this behavior, export the edited clip, and reimport it into your project:

1. Select the clip you want to use in the drop zone.
2. Choose **Share > QuickTime**.
3. Choose **Full Quality** from the **Compress movie for** pop-up menu.
4. Select the option to "Share selected clips only."
5. Click Share
6. Name and save the file.
7. Choose **File > Import**.
8. Select the file you just saved.
9. Click Open.
10. Drag the newly imported clip into the desired drop zone.

About the security content of iTunes 6.0.5

This article has been archived and is no longer updated by Apple.

This document describes the security content of iTunes 6.0.5, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, visit the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to Use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

iTunes 6.0.5

- **iTunes**

  CVE-ID: CVE-2006-1467

  Available for: Mac OS X v10.2.8 or later, Windows XP / 2000

  Impact: An integer overflow in iTunes could cause a denial of service or lead to the execution of arbitrary code

  Description: The AAC file parsing code in iTunes versions prior to 6.0.5 contains an integer overflow vulnerability. Parsing a maliciously-crafted AAC file could cause iTunes to terminate or potentially execute arbitrary code. iTunes 6.0.5 addresses this issue by improving the validation checks used when loading AAC files. iTunes 6.0.5 is freely available from http://www.apple.com/itunes/download/. Credit to ATmaCA working with TippingPoint and the Zero Day Initiative for reporting this issue.

Final Cut Pro: Abort Capture behaves differently when capturing to Xsan

This article has been archived and is no longer updated by Apple.

Final Cut Pro allows you to make a number of settings that control different aspects of its behavior while capturing media. One of these settings is "Abort capture on dropped frames" (**Final Cut Pro > User Preferences > General**).

With this option selected, capture stops immediately when a dropped frame is detected. When capturing to a directly connected or internal HFS+ volume, all media for the clip that was captured up to the point of the dropped frame is preserved. A clip for that media file is placed in the Browser.

But if you're capturing media to an Xsan volume, the "Abort capture on dropped frames" setting behaves differently: The clip media up to the point of the dropped frame is **not** preserved.

If this occurs, you can try to capture the clip again. If the cause for the dropped frame is not due to a problem on the tape, the next capture attempt may proceed without issue. But if repeated attempts always result in an aborted capture, you can re-log the clip, setting its outpoint to just before the point where the dropped frame occurs. This should allow you to capture media up to that point without difficulty

Remote Desktop 2: "Didn‘t upgrade to version 2.1"

This article has been archived and is no longer updated by Apple.

When using the Upgrade Client Software feature from the Manage Menu in the Remote Desktop admin application, you may encounter this alert message:

> "Failed on all. Didn't upgrade to version 2.1."

Additionally `/var/log/system.log` on the client computer contains this entry:

```
localhost /System/Library/CoreServices/RemoteManagement/ARDAgent.app/Contents/MacOS
ARDAgent: CheckDestination: Package install folder is invalid.
```

Solution

This is caused by incorrect permissions of the `/private/tmp` folder, which should be owned by root with a group of wheel:

```
drwxrwxrwt 12 root wheel 408 14 Oct 13:35 /private/tmp
```

You can use Disk Utility to repair the permissions of an affected computer's system volume. Alternatively, you can execute the following command on the affected client systems:

```
sudo chown root:wheel /private/tmp
```

Remote Desktop: Client software is out of date message

This article has been archived and is no longer updated by Apple.

After upgrading Remote Desktop administration software, this alert message may appear:

> The Remote Desktop Client software on this computer is out-of-date.
>
> The Remote Desktop Administrator software requires a newer version of the client software. Open "System Preferences" and check "Software Update".

Solution

Restart the computer and launch Remote Desktop again.

Mac OS X Server: Mobile Users do not appear in the Login Window

This article has been archived and is no longer updated by Apple.

When local-only accounts are not allowed to log in, Mobile User accounts do not appear in the Login Window.

Solution

While mobile accounts don't appear in the list of users at the Login Window, they can still log in using the "Other..." option.

To display Mobile User accounts at the Login Window, make sure the "Allow local-only accounts" option is enabled in Workgroup Manager's Computer List Access settings.

Nike + iPod: How to recalibrate if you get unexpected results

This article has been archived and is no longer updated by Apple.

When you calibrate Nike + iPod, make sure you are running or walking at a steady, natural pace for the specified calibration distance. If you run or walk with an inconsistent pace or travel a distance that is over or under the expected calibration distance, you may get unexpected results (such as incorrect distance of a workout). For best results, first reset the calibration and then recalibrate, instead of just calibrating again.

Follow these steps to reset the calibration and recalibrate.

1. Connect the Nike + iPod receiver to iPod nano, and wear the Nike+ shoes with the sensor properly inserted. Walk around to activate the sensor.
2. On the iPod nano, navigate to **Nike+iPod > Settings > Sensor > Calibrate**.
3. Select the incorrect calibration setting and press the Center button.
4. Select "Reset to Default", and then press the Center button to confirm the reset.
5. Go to **Nike+iPod > Settings > Sensor > Calibrate** and calibrate again with a known distance.

For more information on calibrating Nike + iPod, see the Nike + iPod Users Guide.

QuickTime MPEG-2 Playback Component: Playback of 4:2:2 profile MPEG-2 files is not supported

This article has been archived and is no longer updated by Apple.

The QuickTime MPEG-2 Playback Component provides QuickTime users with the ability to import and play back MPEG-2 content, including both multiplexed (aka muxed, where the audio and video tracks are interleaved together into one track) and non-multiplexed (aka elementary) streams.

The QuickTime MPEG-2 Playback Component is ideal for previewing MPEG-2 video such as that used in DVD-Video content authoring. But there are some kinds of MPEG-2 media that are not supported by the MPEG-2 Playback Component.

Unsupported MPEG-2 Media Types

- Playback of 4:2:2 profile MPEG-2 streams
- Playback of transport streams (which combine audio and video with independent time bases)
- AC3 audio (audio is not decoded)
- Ripped DVD content (content from a DVD video disc saved to another drive)

A note about copyright

Nike + iPod: Workout history is only for currently linked sensor

This article has been archived and is no longer updated by Apple.

You can use multiple Nike + iPod sensors with one iPod nano (though the receiver can only be linked to one sensor during a workout). When you view the Workout History on the iPod nano, it will only display information for the currently linked sensor.

Symptoms

- You share an iPod nano with someone else using Nike + iPod, and your workout history is not displayed or seems incorrect on the iPod nano.
- You have multiple Nike + iPod shoes and sensors, and your workout history is not displayed or seems incorrect on the iPod nano.
- Your Nike + iPod sensor was serviced, and now you can no longer view your previous workout history on the iPod nano, including personal bests and totals.

View on nikeplus.com

To view workout data from multiple sensors together, use iTunes 6.0.5 or later to upload the workout data to nikeplus.com, and view your workout history online instead of on your iPod nano.

Link your sensor

The Workout History information displayed on your iPod nano screen only applies for the currently linked sensor. If you share an iPod nano with another Nike + iPod user and you want to view your workout data on the iPod nano, first link your sensor.

If you are using multiple shoes/sensors with your iPod nano, you will only see the workout history of the currently linked sensor.

Name sensors and specify nikeplus.com accounts

To view your workout data by sensor, use the iPod Preferences in iTunes 6.0.5 or later to name each sensor and specify the appropriate nikeplus.com account name for each one. Then use the nikeplus.com site with the respective user name and password to view your workout history by sensor.

For more information on using multiple sensors, see the Nike + iPod Users Guide.

QuickTime: Saving From Plug-in

This article describes how to save a QuickTime movie from your web browser, when using a QuickTime 3 or 4 plug-in.
This article has been archived and is no longer updated by Apple.
The free version of the QuickTime version 3 and 4 plug-in does not provide the capability to save a movie.

The ability to save is present in the QuickTime Pro version of the plug-in. On the right side of the control bar is a downward pointing triangle which, when clicked, displays a pop-up menu containing two Save options (Figure 1 and 2).

Figure 1: QuickTime Pro plug-in save options (Microsoft Windows).

Figure 2: QuickTime Pro plug-in save options (Mac OS).

You may choose to save the the movie as a QuickTime movie or as Source. Saving as a QuickTime movie includes the entire movie contents as a self-contained file. Saving as Source saves a reference or a pointer to the movie. When you attempt to play a source, it looks for the entire movie at the location saved within the source file.

Note: Webmasters have the ability to disable the save function. If you have QuickTime Pro installed and cannot save a movie, contact the Webmaster to see if they have disabled the save feature.

Published Date: Feb 20, 2012

Nike + iPod: How do I manually upload workout data?

This article has been archived and is no longer updated by Apple.

The easiest way to upload your workout data to nikeplus.com is to enter a Nike.com login ID and password. You can do this when you first connect an iPod nano or iPod nano (second generation) with Nike + iPod workout data on it to your computer. After you enter this information, any new workout data is automatically uploaded to nikeplus.com whenever you connect the iPod nano or iPod nano (second generation) to your computer. This occurs regardless of whether you are syncing music manually or automatically.

If you prefer, it is also possible to manually upload workout data to the nikeplus.com website. Here's how:

When you click on your iPod nano or iPod nano (second generation) there is a "Nike + iPod" tab with a checkbox:
"Automatically send workout data to nikeplus.com"

If you uncheck this checkbox, iTunes will prompt you to upload your workout data each time you connect your iPod nano or iPod nano (second generation).

If you decline the prompt to upload your workout data, but then change your mind and want to upload it, eject your iPod nano and then reconnect it. If there is workout data that has not been uploaded yet, you will see another prompt.

For more information on how to upload workout history, see iTunes Help.

QuickTime: MoviePlayer High Quality Setting

This article describes the High Quality setting in MoviePlayer (and some other QuickTime application programs).

This article has been archived and is no longer updated by Apple.
The High Quality setting is used to tell the codec being used on the selected track to use any higher quality decompression that may be available. This availability is very codec dependent; not all codecs have high quality features.

Turning on High Quality generally takes playback out of the real time mode--higher quality equals lower throughput.

Example: Playback of a 16 bit color or 24 bit color movie on an 8 bit color display. With High Quality turned on, the dithering to 8 bit color is better than with it turned off. However, the higher quality dithering may come at the cost of real time play back depending on the speed of the CPU.

Another area where the High Quality setting makes a difference is with text displayed from a text track. With High Quality turned on, the text is rendered as anti-aliased text. Without High Quality turned on, the text renders without any anti-aliasing. As with other High Quality media, playback of anti-aliased text is at a lower speed than when High Quality is turned off.

So what is the benefit of the High Quality setting? If you are going to recompress a movie, which is a non-real-time action, the typical level of compression artifacts is reduced by turning on the High Quality setting for those tracks which can respond to a high quality setting.

iDVD 6: Looped movies do not play on burned DVD

This article has been archived and is no longer updated by Apple.

Symptom

If you choose **Advanced** > **Loop Movie**, the movie may not play when selected from the DVD menu screen on your burned DVD. In this case, the movie may preview correctly in iDVD, but after the movie is burned, clicking the button to play the selected movie appears to do nothing when playing the actual disc.

Solution

To resolve this issue, add a transition to the button assigned to the looped movie. After setting your movie to loop, follow these steps:

1. If you are in Map view, exit Map view (click Return or choose **View** > **Hide Map**).
2. Select the button linked to the looped movie from the Menu preview pane.
3. Click Buttons in the iDVD window to open the Buttons pane.
4. Choose a transition from the **Transitions** pop-up menu.

Adding the transition should allow the movie to play when selected from the menu.

Logic Pro 7: Troubleshooting Basics

This article has been archived and is no longer updated by Apple.

If Logic Pro isn't starting up properly or performing normally, try these basic troubleshooting steps to remedy the situation. Please note that these steps aren't exhaustive, and are not intended to cover any specific issue. They are fundamental, basic steps that are most effective in getting Logic Pro into good working order, and are the steps most often suggested by AppleCare Technical Support.

Confirm requirements and versions

1. **Check system requirements**
   Make sure that you haven't overlooked any hardware aspect that's required to use Logic Pro. You can view the system requirements on the Logic Pro Technical Specifications page.
2. **Update to the latest software versions**
   Choose **Apple > Software Update** and make sure that you have the most recent updates for your versions of Logic Pro, QuickTime, and other important system files. Installing the latest updates ensures that your software has the latest improvements and enhancements.
3. **Check compatibility and driver versions for third-party devices**
   If you're using a third-party sound card, MIDI interface, storage system, control surface, or plug-ins, check the support area on the manufacturer's website to be sure that you're using the latest version of the relevant driver or other software for your product. For information on troubleshooting possible issues with Audio Unit plug-ins, click here.
4. **Check for Pro Application Support updates**
   Make sure you are using the latest version of Pro Application Support. For more information click here.

Test with no audio driver

You can isolate issues with audio devices by launching Logic with no audio driver. Press and hold down the Control key immediately after Logic starts to launch. A dialog asking whether you wish to launch audio drivers will appear. Click "No" and see if Logic launches normally.

Test using the computer's built-in audio hardware

If you use external audio hardware, try setting Logic to use the built-in audio hardware on your computer. Choose **Audio > Audio Hardware and Drivers** from the main Logic menu. Click the Core Audio tab and choose **Built-in Audio** from the **Driver** pop-up menu. If you are using DAE, disable it first. If the issue is resolved using built-in audio, refer to the manufacturer of your audio interface.

Launch Logic with a new default song

Sometimes song files can become damaged, causing unexpected behavior in Logic. If you use an Autoload or other template, damage to the template can cause unexpected results with any song subsequently created from it. To create a completely fresh song hold down the Option key and choose **File > New**. Test to see if the issue is resolved in the new song. Sometimes, issues with the data in a song can be repaired. Open an affected song and choose **Options > Song Information** from the main menu. Click the "Reorganize Memory" button.

Delete the User Preferences

You can resolve many issues by restoring Logic Pro back to its original settings. This will not impact your song files. To reset your Logic Pro user preference settings to their original state, do the following:

1. In the Finder, go to ~/Library/Preferences. **Note**: The tilde (~) represents your Home folder.
2. Remove the "com.apple.logicpro.plist" file from the Preferences folder.
3. Drag the "Logic" folder from the Preferences folder to your Desktop. Note that if you have programmed any custom key commands, this will reset them to the defaults. You can import your key commands from the copy on your Desktop by following the instructions on page 46 of the Logic Pro 7 Reference Manual. If you use the Project Manager you will also need to rescan your system.

Remove receipts and reinstall Logic Pro

Another approach you might consider is reinstalling Logic Pro. To do this effectively, you need to remove the application and its receipts, then install Logic Pro and use Software Update to install additional updates. You don't have to remove everything that was installed with Logic Pro. Follow the steps below to completely reinstall a fresh copy of Logic Pro. **Note**: Make sure that you have your installation discs handy before starting this.

1. Open the Applications folder.
   Drag the Logic Pro application to the Trash.
2. Go to /Library/Receipts.
3. In the Receipts folder, select the "Logic Pro.pkg" file.
4. Choose **View > as List** to view the contents in a list.

5. Click the Date Modified column header so you can easily see all of the receipts that were installed at the same time as Logic Pro.
6. Drag the Logic Pro.pkg receipt to the Trash, as well as any other items that have the same modification date within 3 minutes of the Logic Pro.pkg's modification date.
7. Click the Name column header to sort the list alphabetically.
8. Drag any other receipts whose names begin with "Logic Pro" to the Trash.
9. Insert your Logic Pro installation disc and install Logic Pro.
10. When finished, use Software Update (under the Apple menu) to update your software to the latest version.

For further information on settings or installation, please refer to the Logic Pro documentation available on your installation discs.

Logic Express 7: Troubleshooting Basics

This article has been archived and is no longer updated by Apple.

If Logic Express isn't starting up properly or performing normally, try these basic troubleshooting steps to remedy the situation. Please note that these steps aren't exhaustive, and are not intended to cover any specific issue. They are fundamental, basic steps that are most effective in getting Logic Express into good working order, and are the steps most often suggested by AppleCare Technical Support.

Confirm requirements and versions

1. **Check system requirements**
   Make sure that you haven't overlooked any hardware aspect that's required to use Logic Express. You can view the system requirements on the Logic Express Technical Specifications page.
2. **Update to the latest software versions**
   Choose **Apple > Software Update** and make sure that you have the most recent updates for your versions of Logic Express, QuickTime, and other important system files. Installing the latest updates ensures that your software has the latest improvements and enhancements.
3. **Check compatibility and driver versions for third-party devices**
   If you're using a third-party sound card, MIDI interface, storage system, control surface, or plug-ins, check the support area on the manufacturer's website to be sure that you're using the latest version of the relevant driver or other software for your product. For information on troubleshooting possible issues with Audio Unit plug-ins, click here.
4. **Check for Pro Application Support updates**
   Make sure you are using the latest version of Pro Application Support. For more information click here.

Test with no audio driver

You can isolate issues with audio devices by launching Logic Express with no audio driver. Press and hold down the Control key immediately after Logic Express starts to launch. A dialog asking whether you wish to launch audio drivers will appear. Click "No" and see if Logic Express launches normally.

Test using the computer's built-in audio hardware

If you use external audio hardware, try setting Logic Express to use the built-in audio hardware on your computer. Choose **Audio > Audio Hardware and Drivers** from the main Logic menu. Click the Core Audio tab and choose **Built-in Audio** from the **Driver** pop-up menu. If the issue is resolved using built-in audio, refer to the manufacturer of your audio interface.

Launch Logic Express with a new default song

Sometimes song files can become damaged, causing unexpected behavior in Logic Express. If you use an Autoload or other template, damage to the template can cause unexpected results with any song subsequently created from it. To create a completely fresh song hold down the Option key and choose **File > New**. Test to see if the issue is resolved in the new song. Sometimes, issues with the data in a song can be repaired. Open an affected song and choose **Options > Song Information** from the main menu. Click the "Reorganize Memory" button.

Delete the User Preferences

You can resolve many issues by restoring Logic Express back to its original settings. This will not impact your song files. To reset your Logic Express user preference settings to their original state, do the following:

1. In the Finder, go to ~/Library/Preferences. **Note**: The tilde (~) represents your Home folder.
2. Remove the "com.apple.logicexpress.plist" file from the Preferences folder.
3. Drag the "Logic" folder from the Preferences folder to your Desktop. Note that if you have programmed any custom key commands, this will reset them to the defaults. You can import your key commands by following the instructions on page 38 of the Logic Express 7 Reference Manual.

Remove receipts and reinstall Logic Express

Another approach you might consider is reinstalling Logic Express. To do this effectively, you need to remove the application and its receipts, then install Logic Express and use Software Update to install additional updates. You don't have to remove everything that was installed with Logic Express. Follow the steps below to completely reinstall a fresh copy of Logic Express. **Note**: Make sure that you have your installation discs and serial number handy before starting this.

1. Open the Applications folder.
   Drag the Logic Express application to the Trash.
2. Go to /Library/Receipts.
3. In the Receipts folder, select the "Logic Express.pkg" file.

4. Choose **View > as List** to view the contents in a list.
5. Click the Date Modified column header so you can easily see all of the receipts that were installed at the same time as Logic Express.
6. Drag the Logic Express.pkg receipt to the Trash, as well as any other items that have the same modification date within 3 minutes of the Logic Express.pkg's modification date.
7. Click the Name column header to sort the list alphabetically.
8. Drag any other receipts whose names begin with "Logic Express" to the Trash.
9. Insert your Logic Express installation disc and install Logic Express.
10. When finished, use Software Update (under the Apple menu) to update your software to the latest version.

For further information on settings or installation, please refer to the Logic Express documentation available on your installation discs.

Logic Pro, Logic Express: Spinning disc cursor after recording

This article has been archived and is no longer updated by Apple.

Symptom

After simultaneously recording more than four audio tracks, the spinning disc cursor may appear for a long time when you stop recording, but before the waveforms are calculated.

Solution

Record audio to a drive that is not journaled. **Note**: It is **not** recommended that journaling be disabled on the main startup drive. Use a second drive formatted to "Mac OS Extended" rather than "Mac OS Extended (Journaled)" for audio recording.

This document will be updated as more information becomes available.

Help Viewer "flickers" when viewing a particular page in Mac OS X 10.4

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4 or later, Help Viewer could appear to "flicker" while trying to display a particular page if there is no valid connection to the Internet.

Solution

Either make sure there is a valid Internet connection before opening a Mac Help page or follow the steps below.

1. Quit Help Viewer if it is open.
2. In the Finder, choose **Go to Folder** from the **Go** menu.
3. Go to this folder: /Library/Documentation/Help/
4. Control-click the MacHelp.help icon.
5. Choose "Show Package Contents" from the pop-up (contextual) menu .
6. Open the Contents folder, then the Resources folder.
7. Open the the English.lproj folder, then the gfx folder.
8. Find "xicnitun.gif" file.
9. Change the name to "xicnitn.gif".

This document will be updated as more information becomes available.

Final Cut Pro 5: Unexpectedly quits after importing XDCAM Clips

This article has been archived and is no longer updated by Apple.

Issue

After importing a number of XDCAM clips into Final Cut Pro using Sony's PDZK-P1 XDCAM Transfer Software (available from Sony), it's possible for Final Cut Pro to enter a condition where it may unexpectedly quit.

Solution

This issue is addressed by the Final Cut Pro 5.1.4 Update.

If you are using a version of Final Cut Pro 5 prior to the Final Cut Pro 5.1.2 update mentioned above, the rest of this document describes how you can anticipate this issue and what steps you can take to avoid possible loss of related data or work.

In the particular case of this workflow, the likelihood of an unexpected quit is related to the number selected for the "Levels of Undo" setting under **Final Cut Pro > User Preferences > General**. Specifically, if you have the Levels of Undo set to a low number, the possible condition for an unexpected quit will occur more frequently. Conversely, the unexpected quit will occur less frequently if you increase the number for the Levels of Undo setting. Closing and reopening Final Cut Pro after using XDCAM Transfer will prevent the condition which can cause the unexpected quit.

Because changing the Levels of Undo setting may only serve to postpone an unexpected quit, it is also recommended that you save your work often while using XDCAM Transfer, as well as just after importing XDCAM clips.

The following steps serve as an example of a workflow that can be used to work abound this issue:

1. Choose **Final Cut Pro > User Preferences > General**.
2. Change the **Levels of Undo** setting to **99** (the highest setting).
3. Click OK to close the **User Preferences** window.
4. Create and save a new project with appropriate settings for the XDCAM media you will be using.
5. Begin importing your XDCAM clips using the XDCAM Transfer Software.
6. Import 99 clips or fewer at one time. After importing, save the project, quit and relaunch Final Cut Pro.
7. If Final Cut Pro unexpectedly quits after you save the project, simply reopen your project and resume work where you stopped. Continue importing your XDCAM clips until finished, saving your project frequently.
8. When you have finished importing XDCAM clips for this work session, save your project, quit Final Cut Pro, and relaunch Final Cut Pro before continuing to edit.
9. The unexpected quit should no longer occur once you have finished using XDCAM Transfer, and then quit and restarted Final Cut Pro.

Note: Since the unexpected quit is related to the number of Levels of Undo, it's a good idea to save your project **before** you take a number of actions equal to the number of Undo levels set in User Preferences.

For more information on using the Sony PDZK-P1 XDCAM Transfer Software, please consult its accompanying documentation, the "XDCAM Transfer User Guide.pdf."

Mac OS X 10.4: Enabling smart card login

This article has been archived and is no longer updated by Apple.

Mac OS X 10.4 Tiger greatly enhances integration for smart cards, as described in this advanced article. The configuration required is much simpler than in previous Mac OS X versions.

Important: The format of the configuration file and the scripts used to configure smart card login have changed from Mac OS X 10.3.x. Do **not** copy or use these files directly from a previous version of Mac OS X, or it may make the system unusable. It is no longer necessary to manually run pcscd, as this daemon is started automatically by Mac OS X when it detects a smart card reader.

It is safe to install a successfully modified /etc/authorization to enable smart card login on any client system, even those without smart card readers. If no reader or card is present, the user will continue to see the default login window, and there will be no performance impact.

To support login with a smart card on Mac OS X 10.4, the card must support signing with a public key. In addition, the card itself must have a plugin, known as a tokend, that can communicate with securityd and the card itself.

Tokends installed with Mac OS X 10.4

There are three tokends installed as part of the base Mac OS X installation.

Tokend	Smart card specification
"CAC"	US Federal Government: CAC: Common Access Card GSC-IS: Government Smart Card Interoperability Specification v2.1
"BELPIC"	Belgian Personal Identity Card
"JPKI"	Japanese Public Key Infrastructure card

Smart cards that are not compliant with the specifications listed above would require a supporting tokend be installed for the smart card to be recognized and available to applications.

Enabling smart card login

Enabling smart card login is controlled through entries in the /etc/authorization file. Perform the following steps in Terminal to modify the authorization file.

1. Execute this command: `sudo -s`
2. Execute this command: `cd /etc`
3. Execute this command: `cp authorization authorization.orig`
4. Execute this command: `cp authorization /tmp/authorization.mod`
   Don't quit Terminal.
5. Next, edit the "/tmp/authorization.mod" file in pico, or your favorite text editor, or the plist editor that comes with the Apple Developer Kit.
6. Make the following changes to the"mechanisms" Array inside the "system.login.console" rights:
   - After the string "<string>builtin:auto-login,privileged</string>" add the string "<string>builtin:smartcard-sniffer,privileged</string>"
   - After the string "<string>builtin:reset-password,privileged</string>" remove the string "<string>authinternal</string>" then add string "<string>builtin:authenticate,privileged</string>"
7. Make the following changes to the "mechanisms" Array inside the "authenticate" rules:
   - add the following string to the beginning of the array "<string>builtin:smartcard-sniffer,privileged</string>"
   - after the string "<string>builtin:authenticate</string>" remove the string "<string>authinternal</string>" then add the string "<string>builtin:authenticate,privileged</string>"
8. After saving the changes, go back to Terminal and execute the following command (while still in the sudo -s session):

```
cp /tmp/authorization.mod /etc/authorization
```

This final step will replace the system's active authorization file with your edited version. These changes take place immediately so you do not need to restart.

Smart cards and Directory Services

Part of the login process is to do a lookup for the expected user in a directory service such as Open Directory, LDAP, or Active Directory. The first and recommended method to link a smart card user with a record in a directory service is to add the hash of the public key to the user's directory record. This is the most convenient and most secure way of identifying a smart card user. The second method is to lookup the user based on values drawn from the email signing certificate as required for the US Federal Government smart card use.

A script is preinstalled to assist you in binding a smart card to a user's local directory domain record. This is /usr/sbin/sc_auth:

```
myhostname#  /usr/sbin/sc_auth -h
Usage:  sc_auth accept [-v] [-u user] [-k keyname] # by key on inserted card(s)
        sc_auth accept [-v] [-u user] -h hash # by known pubkey hash
        sc_auth remove [-v] [-u user] # remove all public keys for this user
        sc_auth hash [-k keyname] # print hashes for keys on inserted card(s)
```

An example of the output from this for a US Department of Defense Common Access Card is:

```
myhostname% sc_auth hash
01C2F20D8964BE7701B57B63B0A1795B8F2604C1 Identity Private Key
443F30C356E676F447CD4DA89F46CC0CCED19737 Email Signing Private Key
4845564C1F8C6B378C19B8F262CE422933CF1FD1 Email Encryption Private Key
```

To add a user to the local directory

```
myhostname% sudo sc_auth accept -u myuser -h 01C2F20D8964BE7701B57B63B0A1795B8F2604C1
```

...where "01C2F20D8964BE7701B57B63B0A1795B8F2604C1" is the hash for the key associated with the Identity Private Key. Refer to the script for further usage instructions. You will need to run this as a user authorized to modify the directory. In this example, any of the hash entries listed could have been used for associating the card to the account. If desired, more than one smart card can be associated with a single user account by running the script again with the hash from the additional card(s).

The script adds a field to the user's authentication_authority property. For example, after executing the command above, the authentication_authority property for the user looks like:

```
myhostname% dscl . -read /Users/myuser
...
    "authentication_authority" = ( ";ShadowHash;", ";pubkeyhash;
01C2F20D8964BE7701B57B63B0A1795B8F2604C1" );
    ...
```

One can immediately log in to a new session using the smart card.

Smart card login uses Open Directory for all of its user lookups, so any supported directory structure will function properly.

Other Directory schema

The method used by sc_auth described above is the recommended way to link a user to their directory entry. However, some sites use an alternative lookup method or are unable to modify their schema for various reasons. To address this, there is a way to configure the smart card authorization plugin to use an attribute mapping method which maps various attributes from a certificate on the smart card to a different field in the directory. This is primarily provided to support the Common Access Card, although it does work with similarly designed smart cards.

The configuration file is an array of dictionaries. Each dictionary in this array represents the data needed to determine one search key in an Open Directory search. If no configuration file is present, the built in method of using the public key hash will be used. The file is at /etc/caclogin config.plist .

Example:

```
    <dict>
        <key>fields</key>
        <array>
            <string>NT Principal Name</string>
        </array>
        <key>formatString</key>
            <string>$1</string>
        <key>dsAttributeString</key>
            <string>dsAttrTypeNative:ntprincipalname</string>
```

```
    </dict>
```

This might produce a search string key (dsAttributeString) of "0123456789@mil". Note that the token after "dsAttrTypeNative:" would be the actual name of the attribute to use in your directory schema.

```
 <dict>
        <key>fields</key>
        <array>
            <string>RFC 822 Name</string>
            <string>NT Principal Name</string>
            <string>Country</string>
        </array>
        <key>formatString</key>
            <string>$1#$2/$3</string>
        <key>dsAttributeString</key>
            <string>dsAttrTypeNative:uniqueid</string>
    </dict>
```

This might produce a search string of "smith@navy.mil#0123456789@mil/US":

There was a similar, but more complicated way of doing this in Mac OS X 10.3. To support the improved integration of smart cards, some unused functionality was removed, providing a much simpler configuration.

The only fields that may appear in the "fields" section of the file are

Key String	Example
Country	US
Organization	U.S. Government
Organizational Unit:1	DoD
Organizational Unit:2	PKI
Organizational Unit:3	USN
Common Name	SURNAME.GIVEN.MI.1160048910
RFC 822 Name	gsurname@navy.mil
NT Principal Name	1160048910@mil

These will be extracted from the e-mail signing certificate. Spaces and capitalization are significant. "Organizational Unit:1" refers to the top level OU and will typically be "DoD". "Organizational Unit:3" refers to the bottom level OU and may be for example "USN".

Example of /var/log/secure.log:

```
May 26 22:55:11 envy SecurityAgent[3900]: Showing Login Window
May 26 22:55:25 envy com.apple.SecurityServer: Token reader SchlumbergerSema eGate 0 0 inserted into system
May 26 22:55:25 envy com.apple.SecurityServer: token inserted into reader SchlumbergerSema eGate 0 0
May 26 22:55:32 envy com.apple.SecurityServer: reader SchlumbergerSema eGate 0 0 inserted token "[User
Key]               " ([User Key]              ) subservice 37 using driver com.apple.tokend.coolkey
```

(This is where the PIN prompt login window appears.)

```
May 26 22:55:32 envy SecurityAgent[3900]: Showing Login Window
May 26 22:55:36 envy SecurityAgent[3900]: User Authenticated: continue login process
May 26 22:55:44 envy com.apple.SecurityServer: Succeeded authorizing right system.login.console by process
/System/Library/CoreServices/loginwindow.app for authorization created by
/System/Library/CoreServices/loginwindow.app.
May 26 22:55:44 envy com.apple.SecurityServer: Succeeded authorizing right system.login.done by process
/System/Library/CoreServices/loginwindow.app for authorization created by
/System/Library/CoreServices/loginwindow.app.
```

A good method for validating that the Smart Card is being recognized by the system is that the smart card appears in the Keychains list. When selecting the keychain in the list all certificates and keys appear within the Keychain Access window.

Mac OS X 10.4: Windows Server 2003 IIS Web Server fails GET call on .DS_Store and ._ files

This article has been archived and is no longer updated by Apple.

Issue or symptom

If the WebDAV client in Mac OS X 10.4 attempts to do a GET on .DS_Store or any ._ file, a Microsoft Windows 2003 IIS Web Server may return a 404 error.

Solution

The Web server included with Windows Server 2003 does not recognize the MIME types for these files. By default, the Windows Server 2003 does not serve unknown MIME types. For information on how to resolve this issue please see this Microsoft support document.

WebObjects: About the WebObjects 5.3.2 Update

This article has been archived and is no longer updated by Apple.

This article contains an overview and download information for the WebObjects 5.3.2 Update. WebObjects 5.3.2 is primarily for developers who want to develop WebObjects applications with Mac OS X 10.4 using the Xcode 2.4 and the WebObjects 5.3.2 Developer Tools. The WebObjects 5.3.2 Developer tools are bundled with the Xcode 2.4 tools release. WebObjects 5.3.2 is formally qualified and supported on the Java 1.4.2 platform.

The WebObjects Current Patch List (http://docs.info.apple.com/article.html?artnum=70037) contains information on all available patches and updates for all versions of WebObjects. Read this document if you're not sure which update you need on your system.

This update addresses the issues and adds support for the features listed below:

- Security improvements
- Incompatibilities with Xcode 2.4 Developer tools on Mac OS X 10.4
- Other improvements

Starting with the Mac OS X Server 10.4, the WebObjects StartupItems mechanism for auto-starting WebObjects services migrated to launchd-based services. The documentation for deploying WebObjects applications can be found at (http://developer.apple.com/documentation/WebObjects/Deployment/Deploying_Applications/index.html). This documentation has been updated to describe the features of Mac OS X Server 10.4.

Security

As part of our security improvements, OpenBase services are not started by default. In order to start services and enable OpenBase applications, follow the steps below:

1. Open /Library/StartupItems/OpenBase/OpenBase in Terminal.app or a text editor as root (sudo in Terminal.app).
2. Uncomment the lines:
    - #/Library/OpenBase/bin/openexec
    - #/Library/OpenBase/bin/openmonitor
3. In Terminal.app, type the command:
    - SystemStarter restart
4. Open /Applications/OpenBase/OpenBaseManager.app.

    Note: if OpenBase still is not accessible, you may need to restart your computer
5. Start the databases such as WOMovies, and so forth.

JDK Support

WebObjects supports JDK 1.4.2 Update 2. However, there are no known, major incompatiblities with J2SE 5.0 Update 4 and WebObjects 5.3.2.

Notes

- If you want to use JDK 1.4 when JDK 1.5 Update 4 is already installed see this article: (http://docs.info.apple.com/article.html?artnum=75505)
- Use the latest OpenBase drivers from http://www.openbase.com to ensure the best JDK compatibility.
- When compiling WebObjects .war, single servlet directory deployment or legacy war bundle applications, make sure to set the javac compiler target and source arguments to "1.4+" to ensure compatibility with J2EE containers.

WebObjects 5.3.2 Developer for Mac OS X 10.4

System requirements

WebObjects 5.3.2 Developer requires:

- Mac OS X 10.4 or later
- Xcode 2.4 Developer tools

- Java 1.4.2 Update 2

If you have not yet updated to the necessary version of Mac OS X or Developer Tools, you must do so before installing WebObjects 5.3.2. Mac OS X 10.4 and the Xcode 2.2 Developer tools are available through Software Update and ADC downloads.

If you are creating a new Mac OS X WebObjects 5.3.2 development system, you should install the software in the following order:

1. Install Mac OS X 10.4.
2. Run the Xcode 2.4 installer.
3. Select the 'Custom Install' option.
4. Enable the WebObjects install packages.

WebObjects 5.3.2 Deployment for Mac OS X 10.4 Server

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download.

System requirements

WebObjects 5.3.2 Deployment requires:

- Mac OS X Server 10.4.7 or later
- Java 1.4.2

If you are creating a new Mac OS X WebObjects 5.3.2 deployment system, you should install the software in the following order:

1. Install Mac OS X Server 10.4.7

Important: WebObjects 5.3.2 is part of the default install of Mac OS X Server 10.4.7. It is not necessary to install either the WebObjects 5.3 Server Update or WebObjects 5.3.1 Server Update.

Configuration tasks

To configure and start the WebObjects services

1. Start the Server Admin application
2. Select the WebObjects service
3. Select the settings tab
4. Configure the wotaskd and monitoring services
5. Hit the 'Start' button

Important: You do not need to manually edit the apache.conf file with the line. We have already inserted it for you.

```
# Including WebObjects Configs Include /System/Library/WebObjects/Adaptors/Apache/apache.conf
```

Troubleshooting

1. My application is throwing the exception "com.webobjects.foundation.NSForwardException for java.lang.NoClassDefFoundError: javax/servlet/ServletContext"

For some reason, the necessary packages are not in your classpath. Debug your classpath to make sure the javax.servlet.* classes are there. If the classes are not found, the resolution is to download the servlet.jar and put it into /Library/Java/Extensions or in your classpath. The servlet.jar can be found with many open source distributions, such as Apache's Tomcat.

2. How do I convert my legacy WebObjects application to build as a true war bundle?

In Xcode, configure your build settings to the following:

```
SERVLET_SINGLE_DIR_DEPLOY = NO
SERVLET_STUB_WAR = NO
SERVLET_TRUE_WAR = YES
SERVLET_DEPLOY_LICENSE = <your deployment license>
SERVLET_WEBAPPS_DIR = /Library/JBoss/3.2/deploy
```

Add the JavaWOJSPServlet.framework to your project.

You should also verify that all of your custom frameworks are being built as jar files and are installed or linked into /Library/WebObjects/lib.

3. Interface Builder and the WebObjects Assistant in Xcode is complaining about the 'Enterprise Objects' palette not being installed.

The 'Enterprise Objects' palette is not loaded by default in the Xcode 2.2 release and beyond and has been moved from an auto-loaded location in /Developer/Palettes to /Developer/Extras/Palettes. This mainly affects people building Java Client nib-based applications.

To load the palette from the new location:

1. Launch Interface Builder
2. Go to the menu item Tools --> Palettes --> Palette Preferences
3. Delete the 'Missing' Enterprise Objects palette reference
4. Add a new reference to the Palette in /Developer/Extras/Palettes

4. Some examples (ThinkMovies) crash when on a JDK 1.4 system.

The resolution is to rebuild with the JDK 1.4 compiler with the JavaBusinessLogic framework located in: /Developer/Examples/JavaWebObjects/Frameworks

Verify that the new JavaBusinessLogic framework is installed into /Library/Frameworks.

5. Java Client applications are not starting when hosted through the Tiger 10.4 Client and Server webserver

Try repopulating your webserver document root with the version found in: /System/Library/WebObjects/WODocumentRoot

Deprecation Notice

Note: As of the release of Xcode 2.4, the Cocoa Java bridge has been deprecated. This means that, while still supported with Xcode 2.4, future releases of Xcode may not support the bridge or other dependent features. As a result, the following additional WebObjects developer applications are also being deprecated:

- EOModeler
- EOModeler Plugin
- WebObjects Builder
- WebServices Assistant
- RuleEditor
- WOALauncher

This also means that the Xcode Java bridge templates have been deprecated, and should not be used for new Java bridge-based development.

iWeb: Menu items are unavailable after reinstall

This article has been archived and is no longer updated by Apple.

Symptoms

When iWeb is opened after a reinstall of the original disc, many of the menu items may be unavailable and new page creation may not be possible. Also the theme selection screen may not appear if there was no existing site in iWeb.

Note: These issues could occur if the iWeb software was updated prior to a reinstall using the original disc.

Solution

When you perform a reinstall from the disc, the original version of iWeb that shipped with the computer is installed, but the Receipts from the updated version of iWeb is still in place causing Software Update not to recognize that an update is needed. To resolve this issue, simply download and install the latest version of iWeb.

Mac OS X: Text to Speech voices can be previewed in English only

This article has been archived and is no longer updated by Apple.

Issue or symptom

You cannot preview Mac OS X's speech voices except when using the English language version of Mac OS X. In non-English language versions, the Play button is dimmed ("grayed out").

Note: Voices can speak text in any language version of Mac OS X (the words are pronounced in English regardless of the Mac OS X language version).

Solution

As a workaround, speak some text with the voice to hear what it sounds like.

Using Fibre Channel switches and hubs with Apple Fibre products

This article has been archived and is no longer updated by Apple.

Apple has certified certain companies' products to function properly in conjunction with the Xserve RAID. For a listing of these companies, please see
(www.apple.com/xserve/raid/certifications.html)

- If using a Qlogic switch, please refer to "Xsan: Using QLogic switches with Apple Fibre Channel Cards."
- If using an Emulex switch, please refer to "Xsan: Configuring Emulex Switches"

When using Fibre Channel switches or Fibre Channel hubs with Apple Fibre Channel Cards (HBAs) and Xserve RAIDs in a Storage Area Network (SAN) topology such as an Xsan deployment, or in a Network Area Storage (NAS) deployment, you may need to modify the port settings to ensure constant communication between devices on the fibre network. The port settings may vary depending on whether your using a Fibre Channel switch or a Fibre Channel hub. Also, the port settings may vary depending on whether the fibre switch or hub port will connect to an Apple Fibre Channel Card or to an Xserve RAID.

In fibre network terminology, hosts such as an Xserve or a Power Mac G5 workstation are known as initiators, and storage devices such as the Xserve RAID are known as targets.

Fibre Channel switches and hubs can either create a topology called FC-SW also referred to as a “fabric﷒? of they may create a topology called FC-AL also referred to as “arbitrated loop.﷒? Contact the manufacturer of your switch to determine which topology your switch creates.

If using an Arbitrated Loop (FC-AL) switch or hub

When a device joins or leaves the Fibre Channel arbitrated loop, a Loop Initialization Process (LIP) is communicated across the fibre network to notify targets and initiators that a device has joined or left the arbitrated loop. The LIP communication will cause a temporary halt of communication on the fibre network. In order to avoid disruptions in Fibre Channel communications, it is necessary to configure your switch or hub in such a way as to prevent Initiators from receiving the LIPs.

When using Arbitrated Loop switches or hubs with Apple Fibre Channel Cards (HBAs) and Xserve RAIDs you may need to modify the switch/hub port settings to ensure constant communication between devices on the arbitrated loop. The fibre hub port settings will vary depending on whether the fibre switch/hub port will connect to an Apple Fibre Channel Card or to an Xserve RAID. On typical Fibre Channel switches/hubs, one may set port property setting to acknowledge LIPs or to not acknowledge LIPs.

If the Fibre Channel switch/hub port is connected to an Apple Fibre Channel Card, set the port property settings to not acknowledge LIPs.

If the Fibre Channel switch/hub port is connected to an Xserve RAID, set the port property settings to acknowledge LIPs.

For all other Fibre Channel switch/hub port connections, consult the manufacturer of the switch/hub.

For instructions on how to change port property settings, please consult the hub manufacturer.

Consult the manufacturer of the switch to verify that a supported version of firmware is installed on the switch.

Important: If your Initiators are nodes in a High Performance Computing Cluster, they may rely on LIPs for proper functionality.

If using a Fabric (FC-SW) switch

When a device joins or leaves the Fibre Channel fabric, a Registered State Change Notification (RSCN) is communicated across the fibre network to notify targets and initiators that a device has joined or left the fabric. The RSCN communication will cause a temporary halt of communication on the fibre network. In order to avoid disruptions in Fibre Channel communications, it is necessary to configure your switch in such a way as to prevent Initiators from receiving the RSCNs.

When using fibre switches with Apple Fibre Channel Cards (HBAs) and Xserve RAIDs you may need to modify the port settings to ensure constant communication between devices on the fabric. The fibre switch port settings will vary depending on whether the fibre switch port will connect to an Apple Fibre Channel Card or to an Xserve RAID. On typical Fibre Channel switches, one may set port property setting to acknowledge RSCNs or to not acknowledge RSCNs.

If the Fibre Channel switch port is connected to an Apple Fibre Channel Card, set the port property settings to not acknowledge RSCNs.

If the Fibre Channel switch port is connected to an Xserve RAID, set the port property settings to acknowledge RSCNs.

For all other Fibre Channel switch port connections, consult the manufacturer of the switch.

For instructions on how to change port property settings, please consult the switch manufacturer.

Consult the manufacturer of the switch to verify that a supported version of firmware is installed on the switch.

Important: If your Initiators are nodes in a High Performance Computing Cluster, they may rely on RSCNs for proper functionality.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About Security Update 2006-004

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2006-004, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, visit the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to Use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2006-004

- **AFP Server**

  CVE-ID: CVE-2006-1472

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: When file sharing is enabled, file and folder items may be disclosed to unauthorized users

  Description: An issue in the AFP server allows search results to include files and folders for which the user performing the search has no access. This may lead to information disclosure if the names themselves are sensitive information. If the permissions of the items allow it, the contents may also be accessible. This update addresses the issue in Mac OS X v10.3.9 by ensuring that search results only include items for which the user is authorized. For Mac OS X v10.4 systems, the issue was addressed in Mac OS X v10.4.7.

- **AFP Server**

  CVE-ID: CVE-2006-1473

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: When file sharing is enabled, authenticated users may cause a crash or arbitrary code execution

  Description: The AFP server contains an integer overflow that can be triggered by an authenticated user. A malicious user with access to the AFP server may be able to cause a denial of service attack or aribtrary code execution with system privileges. The AFP server is not enabled by default on Mac OS X. This update addresses the issue by performing additional validation. Credit to Dino Dai Zovi of Matasano Security for reporting this issue.

- **AFP Server**

  CVE-ID: CVE-2006-3495

  Available for: Mac OS X Server v10.3.9, Mac OS X Server v10.4.7

  Impact: When file sharing is enabled, authenticated local users may be able to access files or folders of other users through AFP

  Description: On Mac OS X Server, the AFP server supports reconnection of file sharing sessions after a network outage. The storage of reconnect keys is world-readable. It may be possible for an authenticated local user to read the reconnect keys, use them to impersonate another user over AFP, and access files or folders with the privileges of the impersonated user. This update addresses the issue by protecting the reconnect keys with appropriate file system permissions. This issue only affects Mac OS X Server.

- **AFP Server**

  CVE-ID: CVE-2006-3496

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: When file sharing is enabled, a maliciously-crafted AFP request may cause the AFP server to crash

  Description: An unchecked error condition exists in the AFP server that may lead to a crash. By carefully crafting an invalid AFP request, an attacker may be able to trigger this condition and cause a denial of service. This update addresses the issue by handling the formerly unchecked error condition.

- **AppKit, ImageIO**

CVE-ID: CVE-2006-3459, CVE-2006-3461, CVE-2006-3462, CVE-2006-3465

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

Impact: Viewing a maliciously-crafted TIFF image may lead to an application crash or arbitrary code execution

Description: Buffer overflows were discovered in TIFF tag handling (CVE-2006-3459, CVE-2006-3465), the TIFF PixarLog decoder (CVE-2006-3461), and the TIFF NeXT RLE decoder (CVE-2006-3462). By carefully crafting a corrupt TIFF image, an attacker can trigger a buffer overflow which may lead to an application crash or arbitrary code execution. This update addresses the issue by performing additional validation of TIFF images. Systems prior to Mac OS X v10.4 are affected only by the TIFF NeXT RLE decoder issue (CVE-2006-3462). Credit to Tavis Ormandy, Google Security Team for reporting this issue.

Note: A fifth issue discovered by Tavis Ormandy, CVE-2006-3460, does not affect Mac OS X.

- **Bluetooth**

  Available for: Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Description: The security of the Bluetooth Setup Assistant has been improved in this update for Mac OS X v10.4.7. The length of the automatically generated passkey used for pairing has been increased from six characters to eight characters.

- **Bom**

  CVE-ID: CVE-2006-3497

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Opening a maliciously-crafted archive may lead to an application crash or arbitrary code execution

  Description: An issue in Bom's compression state handling may cause heap corruption. By carefully crafting a corrupt Zip archive and persuading a victim to open it, an attacker may be able to trigger this condition which could lead to an application crash or arbitrary code execution. Note that Safari will automatically open archives when "Open `safe' files after downloading" is enabled. This update addresses the issue by properly handling such malformed Zip archives. Credit to Tom Ferris of Security-Protocols.com for reporting this issue.

- **DHCP**

  CVE-ID: CVE-2006-3498

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: When bootpd is enabled, a maliciously-crafted BOOTP request may cause arbitrary code execution

  Description: A stack buffer overflow exists in bootpd's request processing. By carefully crafting a malicious BOOTP request, a remote attacker may be able to trigger the overflow and cause arbitrary code execution with the privileges of the system. Note that bootpd is not enabled by default in Mac OS X, and must be manually configured in order to be enabled. This update addresses the issue by performing additional bounds checking.

- **dyld**

  CVE-ID: CVE-2006-3499

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Malicious local users may influence dynamic linker output with undesirable consequences

  Description: Malicious local system users may specify dynamic linker options that cause output to standard error. This output contains informational content and potentially user-specified content. As a result, privileged applications that parse or reuse standard error may be influenced inappropriately. This update addresses the issue by ignoring the problematic dynamic linker options in privileged applications. Credit to Neil Archibald of Suresec LTD for reporting this issue.

- **dyld**

  CVE-ID: CVE-2006-3500

  Available for: Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Malicious local users may influence the loading of dynamic libraries in order to gain elevated privileges

  Description: An improperly handled condition in the dynamic linker may lead to including dangerous paths when searching for libraries to load into privileged applications. As a result, malicious local users may cause the dynamic linker to load and execute arbitrary code with

elevated privileges. This update addresses the issue by properly selecting search paths when executing privileged applications. Credit to Neil Archibald of Suresec LTD for reporting this issue.

- **fetchmail**

  CVE-ID: CVE-2005-2335, CVE-2005-3088, CVE-2005-4348, CVE-2006-0321

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Multiple issues in the fetchmail utility may lead to denial of service or arbitrary code execution

  Description: Several issues in the fetchmail utility were discovered. The most serious issue could lead to arbitrary code execution when fetching mail from a malicious POP3 mail server. All issues are described at the fetchmail website (fetchmail.berlios.de). This update addresses the issues by updating fetchmail to version 6.3.4. In addition, fetchmail is no longer distributed as a privileged utility.

- **gunzip**

  CVE-ID: CVE-2005-0988

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Malicious local users may be able to modify permissions of files owned by another user when the command line tool gunzip is run

  Description: A race condition may allow a malicious local user to modify the permissions of files owned by another user executing gunzip. This issue is only exploitable when executing gunzip on files in directories that are modifiable by other users. This update addresses the issue by properly handling files while decompressing.

- **gunzip**

  CVE-ID: CVE-2005-1228

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Decompressing maliciously-crafted files with "gunzip -N" may lead to arbitrary file replacement or creation

  Description: A directory traversal vulnerability is present in the command line utility gunzip when it is used with the non-default "-N" option. By carefully crafting a malicious compressed file and persuading a user to open it with "gunzip -N", an attacker may replace or create arbitrary files with the privileges of the victim. This update addresses the issue by properly stripping paths from files when decompressing.

- **Image RAW**

  CVE-ID: CVE-2006-0392

  Available for: Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Viewing a maliciously-crafted Canon RAW image may lead to an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt Canon RAW image, an attacker can trigger a buffer overflow which may lead to an application crash or arbitrary code execution. This update addresses the issue by performing additional validation of Canon RAW images. This issue does not affect systems prior to Mac OS X v10.4.

- **ImageIO**

  CVE-ID: CVE-2006-3501

  Available for: Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Viewing a maliciously-crafted Radiance image may lead to an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt Radiance image, an attacker can trigger an integer overflow which may lead to an application crash or arbitrary code execution. This update addresses the issue by performing additional validation of Radiance images. This issue does not affect systems prior to Mac OS X v10.4.

- **ImageIO**

  CVE-ID: CVE-2006-3502

  Available for: Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Viewing a maliciously-crafted GIF image may lead to an application crash or arbitrary code execution

Description: By carefully crafting a corrupt GIF image, an attacker can trigger an undetected memory allocation failure which may lead to an application crash or arbitrary code execution. This update addresses the issue by performing additional validation of GIF images. This issue does not affect systems prior to Mac OS X v10.4.

- **ImageIO**

  CVE-ID: CVE-2006-3503

  Available for: Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Viewing a maliciously-crafted GIF image may lead to an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt GIF image, an attacker can trigger an integer overflow which may lead to an application crash or arbitrary code execution. This update addresses the issue by performing additional validation of GIF images. This issue does not affect systems prior to Mac OS X v10.4. Credit to Tom Ferris of Security-Protocols.com for reporting this issue.

- **LaunchServices**

  CVE-ID: CVE-2006-3504

  Available for: Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Visiting a malicious web site could cause JavaScript to execute in the local domain

  Description: Download Validation may erroneously identify certain files containing HTML as "safe". If such a file is downloaded in Safari and Safari's "Open `safe' files after downloading" option is enabled, the HTML document will automatically be opened from a local URI. This would allow any JavaScript code embedded in the document to bypass access restrictions normally imposed on remote content. This update provides additional checks to identify potentially malicious file types so that they are not automatically opened. This issue does not affect systems prior to Mac OS X v10.4.

- **OpenSSH**

  CVE-ID: CVE-2006-0393

  Available for: Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: When remote login is enabled, remote attackers may cause a denial of service or determine whether an account exists

  Description: Attempting to log in to an OpenSSH server ("Remote Login") using a nonexistent account causes the authentication process to hang. An attacker can exploit this behavior to detect the existence of a particular account. A large number of such attempts may lead to a denial of service. This update addresses the issue by properly handling attempted logins by nonexistent users. This issue does not affect systems prior to Mac OS X v10.4. Credit to Rob Middleton of the Centenary Institute (Sydney, Australia) for reporting this issue.

- **telnet**

  CVE-ID: CVE-2005-0488

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: When the command line tool telnet is used to connect to a malicious TELNET server, environmental variables may be disclosed

  Description: When connected to a TELNET server, the client may send the contents of arbitrary environment variables to the server if the server requests them. Some environment variables may contain sensitive information that should not be sent over the network. This update addresses the issue by ensuring that only non-sensitive variables and variables that the user has explicitly requested are are shared with the server. Credit to Gael Delalleau and iDEFENSE for reporting this issue.

- **WebKit**

  CVE-ID: CVE-2006-3505

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Visiting a malicious web site may lead to arbitrary code execution

  Description: A maliciously-crafted HTML document could cause a previously deallocated object to be accessed. This may lead to an application crash or arbitrary code execution. This update addresses the issue by properly handling such documents. Credit to Jesse Ruderman of Mozilla Corporation for reporting this issue.

- **AppKit, ImageIO**

TA24252_About_Security_Update_.pdf

CVE-ID: CVE-2006-3459, CVE-2006-3461, CVE-2006-3462, CVE-2006-3465

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.7, Mac OS X Server v10.4.7

Impact: Viewing a maliciously-crafted TIFF image may lead to an application crash or arbitrary code execution

Description: Buffer overflows were discovered in TIFF tag handling (CVE-2006-3459, CVE-2006-3465), the TIFF PixarLog decoder (CVE-2006-3461), and the TIFF NeXT RLE decoder (CVE-2006-3462). By carefully crafting a corrupt TIFF image, an attacker can trigger a buffer overflow which may lead to an application crash or arbitrary code execution. This update addresses the issue by performing additional validation of TIFF images. Systems prior to Mac OS X v10.4 are affected only by the TIFF NeXT RLE decoder issue (CVE-2006-3462). Credit to Tavis Ormandy, Google Security Team for reporting this issue.

Note: A fifth issue discovered by Tavis Ormandy, CVE-2006-3460, does not affect Mac OS X.

Final Cut Pro: Timecode Error when capturing from Canon XL H1

This article has been archived and is no longer updated by Apple.

If you're using Final Cut Pro to capture media from a Canon XL H1 via FireWire, it's possible for Final Cut Pro to report a timecode error, when actually, the tape being captured appears to have no timecode errors.

"Unable to Locate Timecode
The timecode appears to be missing from the tape.
Please verify that tape is timecoded correctly. "

Confirm the following settings before capturing:

1. Choose **Final Cut Pro > Easy Setup**.
2. From the pop-up menu choose **HDV - 1080i60 FireWire Basic**.
3. Click **Setup**.
   (Using the "Basic" variant of the HDV FireWire device control protocol with the Canon XL H1 helps to ensure greater interoperability).

Was the tape recorded on another device?
In some cases, a device may read timecode data more reliably if the tape being read was recorded on the same device (or an identical device). You can narrow down the possible cause by trying a test capture from a tape that was recorded in the XL H1.

This document will be updated as more information becomes available.

iWeb: Some podcasting categories have been discontinued

This article has been archived and is no longer updated by Apple.

You can use iWeb to submit your podcast series to the iTunes Store, so that it appears on the Podcast page when people visit the music store online. Visitors to the music store can listen to or download your podcast for free.

In iWeb, you submit your podcast by choosing **Submit Podcast to iTunes** from the **File** menu. In the submission window, the **Category** pop-up menu allows you to select an appropriate choice from a list of categories.

Some publishing categories that appear in the Submit window have been discontinued on the iTunes Store. Discontinued publishing categories include:

- Public Radio
- International
- Talk Radio

Other categories have been renamed slightly and the structure may have changed slightly. Example: A podcast that is submitted as "Arts & Entertainment > Games" will now be automatically categorized under "Games and Hobbies" at the top level.

If you choose a discontinued or renamed category in iWeb, you will have an opportunity to select a different category in iTunes.

This document will be updated as more information becomes available.

Final Cut Pro 5.1: About timecode accuracy with Analog-to-DV converters

This article has been archived and is no longer updated by Apple.

Summary

This document discusses an issue that can occur in Final Cut Pro when using an analog-to-DV converter device along with a third-party adapter for serial device control. This is a common configuration for using Final Cut Pro to capture media that has timecode from older analog tape formats like Beta SP, VHS, or Hi8.

Symptom

Some analog-to-DV converter devices send FireWire timecode to Final Cut Pro during capture, even when no timecode is being sent to the analog-to-DV converter. Because timecode may also be received via the serial connection, a timing mismatch can occur, potentially causing the media in and out points to be off slightly if you use the Capture Clip or Batch Capture functions.

Workaround

You can work around this problem by setting or adjusting media handles when logging clips. (For details on Logging and Capturing media, please refer to the Final Cut Pro User's Manual, available under the Help menu in Final Cut Pro).

In most cases, setting or adjusting the handle value to include an additional 15 frames should provide enough extra media to include the desired in and out points, even when conflicting timecode is received by the analog-to-DV converter during capture.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Logic Pro: User interface for plug-ins may not open

This article has been archived and is no longer updated by Apple.

Symptom

User interfaces for plug-ins on Audio Instruments sometimes do not open. When this happens, the affected plug-ins have no effect.

Solution

This occurs if plug-ins are inserted in slot 16 or higher on the Audio Instrument. Avoid using more than 15 plug-ins (besides the instrument plug-in) on any single Audio Instrument channel. If there are empty slots available before the affected plug-ins, use the hand tool in the Track Mixer to move the plug-ins to the earlier slots.

This document will be updated as more information becomes available.

Mac OS X Server 10.4: Avoid leading spaces when renaming neighborhoods in the Network view of Workgroup Manager

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you rename a neighborhood in the Network view of Workgroup Manager so that it starts with a space, the neighborhood will not be available. The "Layout" tab will list the neighborhood, but it will not exist within the LDAP domain.

The neighborhood will not appear in the Network view in the Finder of a bound client unless you rename it, delete it, and recreate it.

Solution

Rename the neighborhood so it has no leading space(s). Then, delete the neighborhood and recreate it before it becomes available again. Only removing the leading space from the existing record will not resolve the issue.

How to enable iTunes in the Windows XP Firewall

This article has been archived and is no longer updated by Apple.

When the firewall in Windows XP is enabled, it may prevent iTunes from accessing the Internet unless iTunes is listed as an exception.

To make sure that your firewall is not blocking iTunes:

1. On the **Start** menu, click **Control Panel**
2. Double-click Internet Connections
3. Right-click the network interface you use for Internet access and from the shortcut menu choose **Properties**.
4. In the Properties window, click the Advanced tab.
5. In the Windows Firewall section, click the Settings button.
6. In the Windows Firewall window, make sure that the "Don't allow exceptions" option is not selected, and then click the Exceptions tab.
7. Make sure that iTunes is checked under "Programs and Services" and click OK. If iTunes isn't listed under Programs and Services, click Add Program. If iTunes isn't listed in the Programs list, click Browse, navigate to the iTunes program (often at `C:\Program Files\iTunes\iTunes`), select it and click Open. Note that iTunes may also appear as "iTunes.exe."
8. Click OK in the "Add a Program" window.
9. Click OK in the "Windows Firewall" windows.
10. Click OK in the Properties window.

DVD Studio Pro: AC-3 (Dolby Digital) audio may not play back in HD DVD projects

This article has been archived and is no longer updated by Apple.

Summary

An HD DVD authored in DVD Studio Pro 4.1 can contain Dolby Digital Professional AC-3 and DTS compressed audio files or uncompressed (linear PCM) audio files.

Compressor 2.1 allows you to encode Dolby Digital AC-3 audio files. You can encode audio assets, containing from 1 to 5.1 channels, using the Compressor batch and preset capabilities.

Symptom

If you have encoded your assets on an Intel-based Mac, you can import AC-3 audio assets into an HD DVD project, but the tracks may not play back after you build the HD DVD.

This issue does not occur in Standard Definition DVD projects or with AC-3 files encoded on a Power-PC based Mac.

Solution

If you are compressing your DVD assets on an Intel-based Mac, use Linear PCM audio in HD DVD projects.

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Adjust volume for individual items in iTunes

This article has been archived and is no longer updated by Apple.

Depending on how they were created, some songs, videos, or podcasts may be louder or quieter than the other items in your library. iTunes is capable of adjusting the volume automatically so that all of your songs, videos, and podcast have the same volume using Sound Check. iTunes also has a built-in feature that lets you adjust volume levels for individual tracks. Any adjustments you make using the instructions below will stick with that item—whether you're playing them in iTunes or on an iPod.

1. In iTunes, select a song, video, or podcast you'd like to adjust.
2. From the **File** menu, choose **Get Info**.
3. Click the Options pane from the window that appears
4. Adjust the volume to desired level.

5. Click OK.

For further information on listening responsibly, please visit apple.com/sound.

Xsan 1.4: Updating Open Directory for Xsan ACLs

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you plan to use access control lists (ACLs) with Xsan 1.4, and your Open Directory system that was created with Mac OS X Server 10.4.5 or earlier, you may need to update your SAN's Open Directory domain.

Only Open Directory domains created using Mac OS X Server 10.4.6 or later contain the record types needed to support ACLs. If your SAN directory domain was created using Mac OS X Server 10.4.5 or earlier, you need to run a script to add the records to the directory.

Note: This article does not apply if you use Active Directory.

Solution

Update your Open Directory domain for Xsan ACL support:

1. On the server that hosts your Open Directory domain, download the script. You can get the script from here. If your directory server is not connected to the Internet, download the file via a computer that is connected to the Internet, then copy the file to the directory server.

2. On the directory server, double-click the OpenDirectoryACLUpdate.dmg file to mount the disk image volume.
3. Open Terminal (/Applications/Utilities).
4. Execute this command to run the script as the root user:

   ```
   sudo /Volumes/OpenDirectoryACLUpdate/CreateDomainSID
   ```

5. Enter the directory domain's administrator user name and password when prompted.

Final Cut Pro: Minimum Allowable Free Space setting fails with HDV

This article has been archived and is no longer updated by Apple.

Final Cut Pro's preferences include a setting that lets you set the minimum space you want to keep available on a scratch disk. If you have limited scratch disk space, you may want to set this to the amount of disk space you want available for render files. If you use most of your disk space for captured clips, you may run out of space when rendering transitions, and clips with filters or motion parameters applied to them.

If you're working with HDV, it's important to note that this setting is not respected with HDV captures. If you wish to reserve a certain amount of free space on your scratch disk when capturing HDV, you'll need to monitor disk usage yourself.

To determine how much free space is available on a hard drive, follow these steps:

1. Locate the hard drive icon in the Finder.
2. Click the icon once to highlight it.
3. Choose **File > Get Info**.
4. The amount of available free space on the disk is listed in the Info window.

This document will be updated as more information becomes available.

About the Xsan 1.4 Update

This article has been archived and is no longer updated by Apple.

There are two updates for Xsan 1.4: "Xsan 1.4 Update for 10.4 (PowerPC)" and "Xsan Admin 1.4 Update". An "Xsan 1.4 Uninstaller" is also available. These are available from both Apple Downloads and Software Update.

Important: Read before continuing

Before installation

- Xsan 1.1 or later is required in order to install Xsan 1.4.
- If you are setting up a new Xsan deployment, please see this article for the proper installation order.
- Be sure that all Metadata Controllers (MDCs) are updated before you make any configuration changes.
- Before installing, please review the Xsan Migration Guide.
- During installation, do not change any Xsan settings using Xsan Admin or a command-line tool.

After Installation

To prevent an inconsistent volume state, run the `cvfsck` command on each Xsan volume after the MDCs have been updated with Xsan 1.4 Update.

Metadata Controller (MDC) software version

Your MDCs must always have software versions (both Xsan and Mac OS) that are the same or more recent than the most recent client versions. Specifically, if *any* client in your Xsan network is using Xsan 1.4 with Mac OS X 10.4.7 or later, then your metadata controllers (MDCs) must also be updated to Xsan 1.4 on the same version of Mac OS X 10.4.7 or later.

Software Update Installation

Software Update may have referred you to this document. Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, use the `softwareupdate` command-line tool.

Hardware Requirements

- Xserve or Xserve G5
- Power Mac G5 (any)
- Power Mac G4 (dual 800 MHz or faster)

Storage Network Requirements

- Apple Fibre Channel PCI, PCI-X, or PCI-E Card

Compatibility Matrix

See Xsan: Compatibility of SAN clients with Xsan and StorNext controllers.

What's new in Xsan 1.4

Xsan 1.4 Update for 10.4 (PowerPC)

The Xsan 1.4 update improves reliability and is recommended for all systems running Mac OS X or Mac OS X Server version 10.4 or later. It includes improvements for:

- Using file system access control lists (ACLs)
- Labeling and initializing LUNs greater than 2TB in size
- AFP and NFS performance when re-sharing Xsan volumes

- Handling file system quotas and notifications
- Compatibility with Apple and third-party applications

Xsan Admin 1.4 Update

The Xsan Admin 1.4 Update improves reliability for remotely administering, configuring, and maintaining Xsan deployments. It includes improvements for:

- Labeling and initializing Fibre Channel LUNs larger than 2 TB
- Growing Fibre Channel storage pools and volumes
- Working with multiple Xsan metadata controllers in a heterogeneous environment
- Displaying progress messages while performing lengthy operations
- Preventing manually modified configuration settings from being overwritten during a save
- Accurately reporting Fibre Channel multipathing errors

Xsan 1.4 Uninstaller

This uninstaller removes Xsan, the Xsan Admin application, and Xsan documentation files. **Note**: Before removing Xsan, you should back up all of your data and volumes.

Xsan 1.4 documentation

Xsan 1.4 administrators can find Xsan 1.4 documentation here.

Mac OS X Server: Unable to add the root user to service-based ACL for SSH

This article has been archived and is no longer updated by Apple.

Issue or symptom

When using a service-based Access Control List (ACL) for ssh services, you may be unable to add the root user to the list of allowed users.

Solution

Add the root user to the ACL using niutil in Terminal.

1. Open Terminal
2. Execute this command on a single line

```
sudo dseditgroup -o edit -a root -t user com.apple.access_ssh
```

Published Date: Oct 7, 2016

Mac OS X Server: AppleShare performance tuning for client and server

This article has been archived and is no longer updated by Apple.

Learn how you can "tune" AppleShare performance for both Mac OS X client and server in this advanced article.

Client tuning

The AFP client in Mac OS X has the ability to check network latency to the server and select a network packet size based on the result. The client does this by measuring the response time of the first packet it sends to the server to open the AFP connection. This response time is measured in milliseconds and compared to configurable settings in the AFP client.

Note: The client tuning steps below do not affect a Network Home user. The client settings are only loaded after a user logs in. The Network Home user takes its defaults from the system prior to user login.

The values of all AFP client settings can be accessed in Terminal with the following command:

```
defaults read -g com.apple.AppleShareClientCore
```

The two settings that this article will cover are:

- afp_wan_threshold
- afp_wan_quantum

On a standard Mac OS X 10.4.x system, the values reported in Terminal will be zero for both values. This tells the client to use the Apple-supplied standard values of:

- "afp_wan_threshold" = 30; (milliseconds)
- "afp_wan_quantum" = 32768; (bytes) (Mac OS X 10.4.8 and 10.4.7 build 8K1079 or later)
- "afp_wan_quantum" = 8192; (bytes) (other versions of Mac OS X 10.4.7 or earlier)

If the response time is greater than the afp_wan_threshold, then the AFP client assumes that the server is either far away (possibly located across a WAN), or being accessed over a slow link. In this case, the AFP client chooses the afp_wan_quantum size for communicating with the AFP server.

If the round trip timing is less than the afp_wan_threshold, then its assumed that the server is close by (on a LAN) or being accessed through a fast link. The LAN quantum value is 128K or 131072 bytes.

Because the AFP client sets the value of afp_wan_quantum based on its first connection with the server, cases where the AFP server is experiencing loads that artificially slow it's network response time will affect all clients that connect during that time. For all clients connecting to the server on your LAN, you can set the WAN quantum equal to the LAN quantum with this single-line Terminal command:

```
defaults write -g com.apple.AppleShareClientCore -dict-add afp_wan_quantum -int 131072;
```

This command allows the AFP client to use the LAN quantum size regardless of the server's response time when the client first connected.

Please note that if your clients do connect to other servers that are not on your LAN, they will choose the 128K quantum size which can impact your user's experience with those servers. In addition, these client tuning steps will not affect a user with an AFP Network Home Directory.

Server Tuning

For servers not acting as either Network Home or Portable Home Directory servers, more than 150 users can be supported.

For best performance of the server with all connected clients, each server should have at least 2 GB of memory. AFP server maintains caches for each client of both the files that client is using and memory for network communication.

Default Server settings

In /Library/Preferences/, the file "com.apple.AppleFileServer.plist" contains the default threads setting. It is found below "maxThreads". These are the settings for different versions of the operating system:

	AFP defaults
Mac OS X Server version originally installed	**AFP threads**
Mac OS X Server 10.4 for PowerPC (any version)	40
Mac OS X Server 10.4 Universal (any version)	200

maxThreads can be increased to as much as 400 without incurring significant performance penalties (edit the .plist file in the text editor or your choice). After 400 server threads, there can be performance issues with the AFP server due to memory allocation requirements. Threads are not bound to any particular user. The server maintains a pool of threads that perform work as it arrives. Under many workloads a small number of threads can effectively serve a large number of clients. Servers that support large data I/O workloads may benefit from an increased number of threads.

To find the optimum number of threads for your server, start with 200 and test performance and monitor bandwidth usage. Then increase threads by 50 until you reach 400 or a plateau where bandwidth does not increase with the increase in threads. It is important to note that the AFP server will not use the new threads unless it is stopped and started either using the GUI or the command line.

Tip: The the Terminal command `top`, then look for the column labeled "#TH". This number will increase as more users connect, and can be used to confirm how many threads the AFP server is actually using as you test.

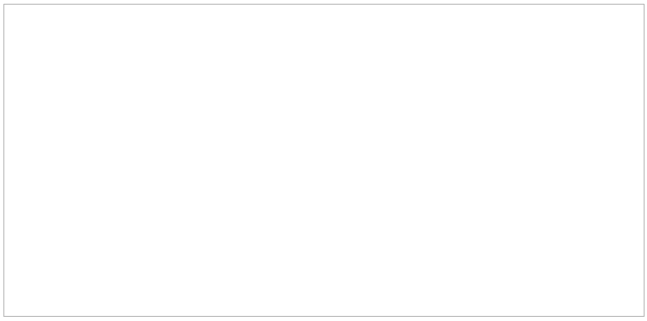
MacBook: White substance on memory cards or slots

Some MacBook memory cards or memory slots have a white substance on their connection surfaces.



This article has been archived and is no longer updated by Apple.

The white substance is a high-quality lubricant used by factories to facilitate installation of memory DIMMs. The grease will not damage the memory or any MacBook components.

Over time the lubricant may evaporate and become less visible. Future RAM installations will not require additional lubricant.

Note: While the grease presents no potential harm if it contacts your skin, it should be washed off using soap and warm water.

Some Apple software may not work if your firewall is blocking UDP port 626

This article has been archived and is no longer updated by Apple.

When setting up firewalls on your local network, be sure to configure them in such a way that allows computers running Mac OS X and Mac OS X Server to communicate over UDP port 626. Local network firewalls may be configured on the computers themselves or on the Ethernet network.

Some Apple software products use this port to check whether any other computers on the same (local) network are using the same serial number. If port 626 is blocked, then certain services may not start as expected, or you may not be able to use some applications.

It is not necessary to leave UDP port 626 open on firewalls that connect a private network to the Internet.

Final Cut Pro: About the Blackmagic Gamma filter for Final Cut Pro

This article has been archived and is no longer updated by Apple.

When using Final Cut Pro 5.x to open clips previously captured with DeckLink 4.x or older drivers, a gamma shift may be seen in the video in some cases. A filter can be used to adjust the gamma to the expected level.

Background information

Blackmagic uncompressed 8 and 10-bit codecs were originally introduced before Final Cut Pro provided its own uncompressed codecs.

Final Cut Pro 5.x provides uncompressed 4:2:2 codecs for both SD and HD video. Accordingly there is no longer a need for the Blackmagic codecs and they are no longer included with the DeckLink and Multibridge drivers.

A side effect of the switch from Blackmagic to Apple uncompressed codecs is that a gamma shift may be observed if media that was rendered with the Blackmagic uncompressed 8 or 10-bit codecs is opened in to Final Cut Pro 5.x. This is due to differences in treatment of gamma levels between the codecs.

Solution

Download and install the Blackmagic Gamma filter for Final Cut Pro. Apply this gamma filter to your legacy clips and they will now appear correctly in Final Cut Pro 5.x. You will need to render any video to which the Blackmagic Gamma filter is applied for smooth playback or output to tape.

Click this link to learn more and to download the filter from the Blackmagic website.

Remote Desktop cannot use Active Directory Groups for management

This article has been archived and is no longer updated by Apple.

After enabling directory-based administration, Remote Desktop may show an "Access Denied" status field if an Active Directory group is used for Directory Services authorization.

Symptom

When following the instructions listed in the Remote Desktop 3 Admin Guide to enable access using Directory Services, if the Administrator Access Group used resides in Active Directory then members of that group may be unable to administer the Remote Desktop clients.

Solution

Option 1

1. Bind an Open Directory Master server to Active Directory.
2. Create Remote Desktop management groups in Open Directory.
3. Add Active Directory Users or Groups to the Open Directory group.
4. Bind the client systems to both Active Directory and Open Directory.

Option 2

1. Create Remote Desktop management groups in the local NetInfo database on each client.
2. Add Active Directory Users or Groups to the local group.

Mac OS X: LACP required for Link Aggregation

This article has been archived and is no longer updated by Apple.

Link aggregation allows you to aggregate or combine multiple physical links that connect your Mac to a link aggregation device (a switch or another Mac) into a single logical link. The result is a fault-tolerant link with a bandwidth equal to the sum of the bandwidths of the physical links.

Mac OS X uses the Link Aggregation Control Protocol (LACP) to negotiate the link aggregation. LACP must be supported on all link aggregation devices involved.

Remote Desktop: Installing a package on clients that are at a login window

This article has been archived and is no longer updated by Apple.

Before installing a software package on a client via Remote Desktop, use the ARD Lock Screen command first, then install.

After installing the software, restart any client computers that are at the login window.

Additional information

When installed at the login window, some packages installers will display a dialog which will allow the client to login as root even though the login window is still displayed. Because of this, you should restart the client computers when running a package installation task to prevent any unauthorized users from obtaining root access.

Published Date: Feb 20, 2012

Remote Desktop: Unable to install because a later version is already installed

This article has been archived and is no longer updated by Apple.

Issue

When running the Remote Desktop 2.0 installer and choosing a volume to install to, the installer may state that a more recent version of the software is already installed.

This can happen after a client is installed using a Custom Remote Desktop Installer package (via Remote Desktop Admin), and then tries to install from the Remote Desktop 2.0 CD.

Solution

Remove the following items, then run the Remote Desktop 2.0 installer again:

- /Library/Receipts/PantherSharing.pkg
- /Library/Receipts/RemoteDesktopClient220.pkg

Remote Desktop 2: How to use ssh tunneling to control a VNC Server

This article has been archived and is no longer updated by Apple.

Learn how to use Remote Desktop 2 to control a VNC Server via an ssh tunnel.

Note: If you don't have the AppleVNCServer running on your machine, you can forward port 5900 and skip step 4.

1. Open an ssh connection to a remote computer to port forward the port:

   ```
   ssh -L 5910:remoteserver.apple.com:5900 -f -N user@remoteserver.apple.com
   ```
2. Enter the password as you would in a typical ssh connection.
3. Open Remote Desktop and add 127.0.0.1 to the list with the name and password of the remote machine. Add to the list without verifying the password.
4. Get Info on the computer you added and click the Edit button.
5. Add the port number from step 1 (in this example, 5910). Be sure to add a colon between the IP Address and the port number, such as "127.0.0.1:5910".
6. Click Done. When you control or observe the "127.0.0.1" machine, you will be accessing the remote computer.

Note: Remote Desktop 3 introduces an option to encrypt all network data, which uses an ssh tunnel when controlling or observing.

Mac OS X 10.3, 10.4: Preventing users from opening non-approved applications via a URL

This article has been archived and is no longer updated by Apple.

Issue or solution

Users can be restricted from opening certain applications using Parental Controls and Workgroup Manager but applications will still be able to open and launch restricted applications. Opening an application from another application is called "sub-launching".

Solution

On Mac OS X 10.3 or later-based computers bound to Mac OS X Server, you can allow or disallow sub-launching by using the following steps on the server:

1. In Workgroup Manager, select a user, group, or computer list.
2. Click Preferences, then Applications.
3. Select the "Allow approved applications to launch non-approved applications" checkbox to enable sub-launching, or deselect the option to disable it.

On Macintosh computers running Mac OS X 10.4 or later, you can use Parental Controls in Accounts preferences to disable sub-launching. Deselect the "Allow supporting programs" checkbox (in Finder & System).

Note: On Mac OS X 10.3-based client computers, sub-launching cannot be disabled through System Preferences.

Xsan: "wheel" is the group owner of files created on an Xsan volume

This article has been archived and is no longer updated by Apple.

In Mac OS X and Mac OS X server, when creating files and folders, group ownership is automatically set to match the group ownership of the parent folder. However, by default, Xsan volumes have their group ownership set to "wheel". As a result, all files and folders created on an Xsan volume have group ownership set to "wheel".

If this does not suit your site's workflow, manually change a folder's group ownership to another group in the Finder.

After changing the group ownership on a folder, all files and folders created within the folder will have group ownership set to match the parent folder's group ownership.

iLife: Alert message appears when attempting to share media between applications

This article has been archived and is no longer updated by Apple.

Issue or symptom

When attempting to use the Share feature of an iLife application, you are unable to send the media between the applications because an unexpected error occurs.

Examples:

- When attempting to share or export a slideshow from iPhoto, an alert message appears, "An error occurred while exporting the slideshow. The export movie file could not be created."
- When attempting to send a movie from iMovie to iDVD, an alert message appears, "The movie could not be sent to iDVD, because of an unknown error. Please make sure that iDVD is properly installed so that your project disk has write permission and that you have enough disk space. Error 0".
- When attempting to share files from iMovie or iPhoto to iDVD, the iDVD project opens, but will not save. No alert message is displayed.
- When attempting to share a movie from iMovie to iTunes for use on your iPod, an alert message appears: "Movie could not be sent to iTunes because of an unknown error. Error 0".

Solution

Make sure that you have the following folders in your home folder, and that you have read/write permissions for these folders:

- Documents
- Music
- Photos
- Movies

If these folders are missing or renamed, you may not be able to send media between iLife applications.

Remote Desktop: Controlling a computer that has stopped responding

This article has been archived and is no longer updated by Apple.

Issue or symptom

When controlling a computer via ARD 2.0 or later that has lost power or has stopped responding, the control session may remain active on the Remote Desktop Admin computer.

Solution

You can dismiss the control session by closing the control window or clicking the "Exit control or observe session" button when using full screen mode. If the client comes back online while the control session is still active, it may automatically reconnect.

Note that the 'Trying to reconnect...' message does not display during this time.

Logic: Clicks and pops when playing instruments live

This article has been archived and is no longer updated by Apple.

Symptom

The output from Audio Instruments may have clicks, pops, and crackles during a live performance.

Solution

This issue can be caused by brief spikes in processor load required by some instrument or effect plug-ins at high sample rates and/or low buffer sizes. These processor overloads will usually not show up in Logic's Audio Performance meter. Raise the audio driver buffer size or reduce the song sample rate to resolve the issue.

To raise the audio driver buffer size choose **Logic Pro > Preferences > Audio > Drivers** and set the next higher value for the "I/O Buffer Size" setting.

Published Date: Feb 20, 2012

iPhoto: Burning a disc when more than one optical drive is connected

This article has been archived and is no longer updated by Apple.

Summary

iPhoto may not be able to burn a disc if the computer has more than one optical drive available.

Symptom

When burning a disc from iPhoto, you are prompted to insert recordable media. Both optical drive trays may open. In this case, no matter which tray you insert the recordable media into, iPhoto does not find the inserted disc, but instead cancels the burning process.

Solution

To avoid this issue, insert your blank media into one of the drives before you select the option to burn a disc in iPhoto. Close any drive trays that are opened. If you are prompted by the Finder that you have inserted blank media, click Ignore in the dialog that appears. Then select the option to burn in iPhoto.

About Security Update 2006-004 for Mac Pro

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2006-004 for Mac Pro, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, visit the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to Use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2006-004 for Mac Pro

Security Update 2006-004 was released on August 1, and details are available via:
http://docs.info.apple.com/article.html?artnum=304063

Mac Pro computers ship with Mac OS X v10.4.7 Build 8K1079. Also, the existing Xserve hardware now includes Mac OS X Server v10.4.7 Build 8K1079.

The fixes provided in Security Update 2006-004 (August 1 release) are contained in Build 8K1079, with the exception of the ones listed below for ImageIO and OpenSSH. The fixes for these issues were not fully tested in time for the manufacturing of the Mac Pro, and are being provided via this security update.

This update is a proper subset of the full Security Update 2006-004 released on August 1. Existing systems that have already applied Security Update 2006-004 (Aug 1 release) do not need to install this update.

The following security fixes are provided only for systems running Mac OS X v10.4.7 Build 8K1079 or Mac OS X Server v10.4.7 Build 8K1079 to reach the full security level provided with Security Update 2006-004 (August 1 release).

- **ImageIO**

  CVE-ID: CVE-2006-3459, CVE-2006-3461, CVE-2006-3462, CVE-2006-3465

  Available for: Mac OS X v10.4.7 Build 8K1079, Mac OS X Server v10.4.7 Build 8K1079

  Impact: Viewing a maliciously-crafted TIFF image may lead to an application crash or arbitrary code execution

  Description: Buffer overflows were discovered in TIFF tag handling (CVE-2006-3459, CVE-2006-3465), the TIFF PixarLog decoder (CVE-2006-3461), and the TIFF NeXT RLE decoder (CVE-2006-3462). By carefully crafting a corrupt TIFF image, an attacker can trigger a buffer overflow which may lead to an application crash or arbitrary code execution. This update addresses the issue by performing additional validation of TIFF images. Systems prior to Mac OS X v10.4 are affected only by the TIFF NeXT RLE decoder issue (CVE-2006-3462). Credit to Tavis Ormandy, Google Security Team for reporting this issue.

  Note: A fifth issue discovered by Tavis Ormandy, CVE-2006-3460, does not affect Mac OS X.

- **OpenSSH**

  CVE-ID: CVE-2006-0393

  Available for: Mac OS X v10.4.7 Build 8K1079, Mac OS X Server v10.4.7 Build 8K1079

  Impact: When remote login is enabled, remote attackers may cause a denial of service or determine whether an account exists

  Description: Attempting to log in to an OpenSSH server ("Remote Login") using a nonexistent account causes the authentication process to hang. An attacker can exploit this behavior to detect the existence of a particular account. A large number of such attempts may lead to a denial of service. This update addresses the issue by properly handling attempted logins by nonexistent users. This issue does not affect systems prior to Mac OS X v10.4. Credit to Rob Middleton of the Centenary Institute (Sydney, Australia) for reporting this issue.

Safari: Downloaded file‘s filename may have an additional extension

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you download files in Safari, an extra filename extension may be added.

For example, if you download a JPEG (.jpg) file, the downloaded file might be named "filename.jpg.html" instead of "filename.jpg".

Solution

If the filename extension added by Safari is not accurate, delete the extension from the file name and the file should open in the correct application. If it does not, use Get Info in the Finder to force the file to open with a certain application, such as described here.

Additional information

Safari might add these extensions based on information received from the website about the file type. If file type sent by the server does not match the extension, Safari may append an extension to ensure the file is recognized by the Finder.

AppleWorks 6: Can‘t install due to privileges alert

This article has been archived and is no longer updated by Apple.

Symptom

When you attempt to install AppleWorks 6 in Mac OS X, you may receive this alert message during the installation:

> "You do not have enough access privileges for this installation" error code 1008:5,-5000

Solution

This indicates a permissions issue in a location where AppleWorks is attempting to install an item. Be sure that you are installing as an administrator and that you have read/write access to the Applications folder. You may also want to try using the "Fix Disk Permissions" option in Disk Utility.

In addition to this, if you have a Classic System Folder (Mac OS 9) on your hard disk, you should choose **Fix OS 9 Permissions** from the **File** menu in Disk Utility. This option is different from the general "Fix Disk Permissions" option in the Disk Utility window.

Boot Camp Beta 1.1: VGA adapters, Mini-DVI adapters are not supported

This article has been archived and is no longer updated by Apple.

Issue or symptom

With Boot Camp Beta 1.1 and Windows XP, VGA adapters are not supported, even if they work in Mac OS X. For example, you cannot use displays, projectors, or TV output devices if they require a VGA adapter.

Video output over Mini-DVI adapters for MacBook computers, or DVI-to-VGA adapters for MacBook Pro computers, is also not supported even if it works in Mac OS X.

Solution

If your VGA-based device connects directly to your Mac with no adapter, it should work.

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

DVD Studio Pro: QuickTime and Simulator display incorrect gamma for MPEG-2 HD DVD content

This article has been archived and is no longer updated by Apple.

Issue or symptom

When comparing your source video to encoded HD DVD MPEG-2 assets, it may appear that the levels have shifted and that the image is darker after compression. This is the result of incorrect gamma interpretation by QuickTime Player and the DVD Studio Pro Simulator.

Solution

HD DVD's authored in DVD Studio Pro won't demonstrate this gamma shift when played in a set-top player.

This document will be updated as more information becomes available.

Xsan Filesystem 1.4

- **Xsan**

  CVE-ID: CVE-2006-3506

  Available for: Mac OS X v10.4.7, Mac OS X Server v10.4.7

  Impact: Malicious users may be able to cause systems using Xsan to crash or execute arbitrary code

  Description: A buffer overflow may occur in the Xsan Filesystem driver when processing a path name. A malicious user with write access to an Xsan volume may be able to trigger the overflow on systems directly attached to Xsan. This could lead to a system crash or arbitrary code execution with system privileges. This update addresses the issue by performing additional validation of path names. Credit to Andrew Wellington of the Australian National University for reporting this issue.

Published Date: Oct 7, 2016

Xsan: Some file and folder names may not be readable on Windows or Linux

This article has been archived and is no longer updated by Apple.

Issue or symptom

Files and folders with names that contain 2-byte characters may appear incorrectly when created on Xsan and viewed from Microsoft Windows or Linux, or vice-versa.

Note: 2-byte characters are commonly used in Japanese, Chinese, and Korean fonts.

Solution

Rename the file or folder so that it contains only ASCII characters.

This document will be updated as more information becomes available.

PowerPC G3-based Macs do not support Mac OS X Server 10.4.7 (Universal) retail box

This article has been archived and is no longer updated by Apple.

Issue or symptom

The retail box version of Mac OS X Server 10.4.7 (Universal) does not support PowerPC G3-based Macs, but Mac OS X Server 10.4 (non-universal) updated to version 10.4.7 does support PowerPC G3-based Macs.

Solution

Mac OS X Server 10.4 (non-universal) install media and software updates work on G3 based Macintosh computers. Consult your Mac OS X Server documentation for information about supported configurations.

Boot Camp Beta 1.1: Windows XP boots to a blue screen

This article has been archived and is no longer updated by Apple.

Issue or symptom

After installing Windows XP using Boot Camp Assistant, Windows XP may start to a blue screen.

Solution

1. Restart Windows while holding the F8 key (Safe Mode).
2. Select the choice "Last Known Good Configuration."
3. When prompted, choose Microsoft Windows XP Home or Professional.
4. Boot back into Windows.
5. Reinstall drivers from the Macintosh Drivers CD you made before installing Boot Camp Beta.

AirPort: Issues connecting to third-party wireless access points using proprietary speed enhancement options

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some third-party wireless network access points offer proprietary non-standard speed boosting modes that only work with wireless client cards from the same vendor. If you have an access point that uses these special modes, they may cause issues for your standards-based AirPort wireless cards. If you have any issues, check the wireless setting on your third-party router and disable any specialized modes.

Solution

If you encounter any issues connecting wirelessly to your third-party access point, try disabling AirPort on your computer and connect to the wireless access point with an ethernet cable. Review the settings and disable any special, proprietary speed boosting features. You may need to contact the vendor of your access point for assistance with the configuration changes.

Mac Pro: Video frame rate appears to be slow in some programs

This article has been archived and is no longer updated by Apple.

If you are running Mac OS X 10.4.7 on your Mac Pro and notice that the video in some programs or games appears to be slow, check the Mac OS X build number. The build number is available in the About This Mac window. To locate the build number:

- From the Finder, go to the Apple menu and select About This Mac.
- When the About This Mac window appears, click on the gray text that says "Version 10.4.7" directly under the large words "Mac OS X".
- This will toggle the text to give you the build number. It should say "Build 8K1079" or something similar.

If your build number is 8K1054 or anything less than 8K1079, use the Install discs that came supplied with your computer to perform an Archive and Install. This will update your computer's version of Mac OS X to Build 8K1079 and should improve the video performance.

Published Date: Feb 20, 2012

About the Mac OS X 10.4.8 Update (delta)

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.8 Update (delta) updates Mac OS X 10.4.7 to version 10.4.8 on both Intel-based Macs and PowerPC-based Macs. (If you are updating from *Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, or 10.4.6* to 10.4.8, see this article instead.)

Important: Please read before installing.

- After installing the delta version of this update on an Intel-based Mac, the computer will restart two times--the first restart after installing this update may take several minutes; please allow it to complete.
- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- If issues occur during installation--for example, Software Update quits unexpectedly, please see this article.

Installation

There are two ways to update to Mac OS X 10.4.8: Use Software Update or the standalone installer. You only need to use *one* of these methods to update your computer.

Automatic Software Update

Software Update, located in the **Apple** menu, will automatically download the latest Apple software. (Software Update might have linked you to this article to learn more about the update.) Note that the update's size may vary from computer to computer when installed using Software Update. Some updates must be installed prior to others, so you may need to run Software Update more than once to get all of the available updates.

Standalone installer

Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. Two versions of the standalone installer are available from Apple Downloads: a delta and combo.

- The delta update for PowerPC and Intel-based Macs installer (described here) updates Mac OS X 10.4.7 to 10.4.8.
- The combo update installer (described in this article) updates Mac OS X 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, and 10.4.7 to 10.4.8.

What's included?

This update offers many improvements, including the following, which apply to both Intel- and Power-PC-based Macs unless otherwise noted:

Printing

- Adds support for CDSASSL (Common Data Security Architecture Secure Sockets Layer) printer connections.
- Addresses an issue for Mac OS X 10.4.7 in which some documents containing some Chinese or Korean language characters might not print as expected.

Finder and Apple applications

- Resolves an issue in which a Finder alert message with the buttons "Initialize", "Ignore", and "Eject" might not appear after connecting a partitioned FireWire hard drive.
- Addresses a potential issue in which Preview may unexpectedly quit.
- Improves reliability of iTunes syncing with certain iPod models.

Networking and modem

- Resolves performance issues that could occur when connecting to a Comcast network.
- Improves security by adding support for EAP-FAST for AirPort wireless authentication.
- Improves Express Card behavior for portable Intel-based Macs.
- Improves reliability for connections made in Ireland with an external Apple USB Modem.
- Improves connection reliability for external Apple USB Modems when resuming an Internet connection after answering an incoming call.
- A computer restart is no longer needed to restart nfsd.
- Improves Apple File Sharing client performance by changing the default AFP WAN quantum size.. More...

- Windows File Sharing now generates only one process, avoiding an issue that could cause a Mac OS X computer to become unresponsive if it won a master browser election.
- Improves reliability when faxing in France or Belgium via an external Apple USB Modem.

Third-party

- Resolves an issue for Microsoft Word in which Word might stop responding when saving a file that uses certain OpenType fonts.
- Adds RAW image decoding support for these cameras: Sony DSLR-A100, Nikon D2Xs, Fuji FinePix S2 Pro, Fuji FinePix S3 Pro (+Highlights) and Konica Minolta 7.
- Resolves an issue in which thumbnails may appear blank when importing RAW images from a Canon 30D camera.
- Resolves an issue for Microsoft PowerPoint in which the display resolution might not change as expected after switching from a PowerPoint presentation to a different application via Command-Tab.
- Improves compatibility for Canon EOS Utility software after connecting a Canon EOS Kiss Digital camera to a PowerPC-based Mac.
- Improves compatibility for the TV Tracker 2 Dashboard widget.

Other

- Includes recent Apple security updates.
- Improves the accuracy of Rosetta numerics and addresses Altivec translation issues on Intel-based Macs.
- ColorSync matching no longer fails when using a V4 ICC profile in an application opened with Rosetta on an Intel-based Mac.
- Addresses an issue in which some USB devices connected to a PCI card may not be recognized after starting up or waking the computer.
- Resolves an issue in which external USB-based video cameras may not be available after quitting the application that is using it.
- Reduces time needed to transfer data from a USB-based image scanner.
- Improves responsiveness of the Translation Dashboard widget.
- Addresses an issue in which text typed with the Hangul input method may not be visible while the Caps Lock key is active, on PowerPC-based Macs.
- Adds support on Intel-based Macs for multiple cores to LAPACK and BLAS routines in the Accelerate framework; the maximum number of threads used by Accelerate BLAS routines is now limited by the environment variable VECLIB_MAXIMUM_THREADS; addresses an issue with some complex BLAS routines in the Accelerate framework that were encountering an illegal instruction.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About the Mac OS X Server 10.4.8 (PowerPC) Update (combo)

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X Server (PowerPC) versions 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6 and 10.4.7 to Mac OS X Server 10.4.8. It is a "combo" update that combines fixes delivered with versions 10.4.1 through 10.4.8. If you already have Mac OS X Server 10.4.7 (PowerPC), you can download a smaller update to update to version 10.4.8.

The 10.4.8 Server Update is recommended for all servers and includes fixes for the operating system and various applications, services and technologies. **Note**: The Mac OS X 10.4.8 Update (for *client* Macs) also includes fixes for the AFP client software. Apple recommends installing this update on client machines in conjunction with updating Mac OS X Server.

Important: Please Read Before Installing

- After installing this update, the computer will restart two times.
- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.8. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.8: Use Software Update or install from a standalone installer.

Software Update Installation
Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Note: This version of Mac OS X Server is built as a multi-package and should not be used with Software Update's "Download Only" and "Install and Keep Package" options. If you need to save these packages for later use, try the manual update instead.

Standalone Installer
A standalone installer is also available from Apple Downloads.

Remote Installation
If you need to install the update on a remote computer, you can do so using the softwareupdate command-line tool.

What's included?

This update delivers many fixes. Because this is a combo update, it includes fixes delivered with the Mac OS X Server 10.4.8 delta update as well as these previous Mac OS X Server 10.4.x updates: 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, and 10.4.7.

Published Date: Oct 7, 2016

About the Mac OS X Server 10.4.8 (PowerPC) Update (delta)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server 10.4.7 (PowerPC) to version 10.4.8. **Note**: PowerPC-based Macintosh Servers with Mac OS X Server (Universal) 10.4.7 installed should use the Mac OS X Server (Universal) 10.4.8 Update instead.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.8. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.8: Use Software Update or install from a standalone installer.

Software Update installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Note: Do not use the "Download Only" or "Install and Keep Package" options in Software Update. The resulting download will not install on your server. If you need a standalone installer, follow the instructions in the next section.

Standalone installer
A standalone installer is also available from Apple Downloads. The Mac OS X Server 10.4.8 (PowerPC) Update specifically updates version 10.4.7 (PowerPC) to version 10.4.8. There is also a combo update installer available, which will update any version of Mac OS X Server 10.4 (PowerPC) to 10.4.7.

Remote installation
If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool or the Server Admin application. Information about the Server Admin application can be found here.

What's included?

Apple File Service (Server)

- Addresses Apple File Server performance, particularly on servers with many sharepoints.

Apple File Service (Client)

- Reduces load on server when copying large files.
- Increases the default WAN quantum value to 32678. More...

NetBoot/Netinstall

- Added latest hardware releases (as of this update) to Model Filters within System Image Utility.

NFS

- Fixes a socket handling issue that could prevent nfsd from restarting.

Password Server

- Addresses a potential issue in CFArrayRemoveAllValues.
- Addresses an issue for 10.4.6 and 10.4.7 that prevented saving changes to the Password Server security policy.

Networking

- Adds support for TCP Selective Acknowledgments to improve performance on congested networks.

Windows File Service

- SMB server now honors membership in 16 or more groups.

Other

- Eliminates extraneous system log messages such as the following during password server replication: "/usr/bin/gzip: stat on /var/db/authserver/syncfile1150955872.635883: No such file or directory".

This update also includes security updates for Mac OS X Server 10.4. For detailed information on Security Updates, please visit this website: http://www.info.apple.com/kbnum/n61798.

Published Date: Oct 7, 2016

About the Mac OS X Server 10.4.8 (Universal) Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server 10.4.7 (Universal) to version 10.4.8. **Note**: If you have PowerPC-based Macintosh Servers with Mac OS X Server 10.4.7 (non-Universal) installed, you should use the Mac OS X Server (PowerPC) 10.4.8 Update instead.

Important: Please Read Before Installing

- After installing this update, the computer will restart two times—the first restart after installing this update may take several minutes; please allow it to complete.
- You must have an administrator account password that does not contain Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.8. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server (Universal) 10.4.8: Use Software Update or install from a standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone installer
A standalone installer is also available from Apple Downloads. The Mac OS X Server 10.4.8 (Universal) Update specifically updates version 10.4.7 (Universal) to version 10.4.8.

Remote installation
If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool or the Server Admin application. Information on the Server Admin application can be found here.

What's included?

This update delivers many fixes.

AFP Server

- Fixes a race condition in AFP's buffer handling code for Intel-based servers.

Filesystem

- Increases the maximum number of vnodes on servers with at least 2 GB of RAM

NetBoot/Netinstall

- Added latest hardware releases (as of this update) to Model Filters within System Image Utility.

Networking

- Adds support for TCP Selective Acknowledgments to improve performance on congested networks.

NFS

- Fixes a socket handling issue that could prevent nfsd from restarting.

QuickTime Streaming Server

- Enables streaming movies to localized versions of the QuickTime Player

Xsan

- Resolves a potential kernel panic issue when operating with Xsan and other memory-intensive kernel extensions.

This update also includes the standalone security updates released since Mac OS X Server 10.4.7. For detailed information on Security Updates, please visit this website: http://www.info.apple.com/kbnum/n61798.

Mac OS X 10.3.9: Disk Utility "Image/device is too large" alert

This article has been archived and is no longer updated by Apple.

Issue or symptom

In Mac OS X 10.3.9, Disk Utility may fail when trying to create an image from a device if the device's capacity is larger the 8 GB -- a "Image/device is too large" alert appears in Disk Utility when this happens.

Solution

Use one of these workarounds:

- Use the "Image from Folder..." option in Disk Utility instead.

  or

- Start from an external drive that contains a version of Mac OS X 10.3 earlier than 10.3.9. Then, use Disk Utility from the external drive to image the device.

  or

- Image the device from a Mac OS X 10.4 Tiger-based computer.

Final Cut Studio: About external video-monitoring conflicts

This article has been archived and is no longer updated by Apple.

Summary

Some of the applications included with Final Cut Studio are able to display output to an external video device. Viewing such output on a precisely calibrated monitor is the best way to accurately evaluate color and framing of material that is intended to be viewed on a television. Apple Qualified video interfaces are evaluated with each of the Final Cut Studio applications that can access them for output. Other applications, such as iMovie HD and Final Cut Express also allow external video monitoring.

Issue

It's possible for a minor conflict to arise if a Final Cut Studio application is running at the same time as another application, which also uses external video output. If both applications are set to access the same video output device in such a case, switching directly from one application to another may cause unexpected results. In many cases, you might see an alert message, such as this one:

The video output device could not be opened.

This situation is merely a display characteristic; it won't affect your projects or your media.

Solution

In unusual instances, if the application has lost contact with the video interface, you can simply quit the application, then open it again. If you're working in two Final Cut Studio applications that require video output from the same device, you can quit the first application prior to opening the second.

If both applications need to be running simultaneously, you can set one of the two applications so that it will not output video. This should allow you to actively move between the applications with ease. Check the user guide under the Help menu for specific steps for each application.

Mac OS X: Exposé puts all open windows in one row

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you have several open windows that are lined up together and invoke Exposé, the windows will be shown in a single row (line) across the screen. For example, if the open windows are all touching the Mac OS X menu bar.

Solution

Move any one of the windows slightly so that is it not inline with the other windows, then invoke Exposé again.

Desktop Printer Utility: No Mac OS 8.0 Support

When I launch the Desktop Printer Utility I receive the error "This version of Desktop Printer Utility does not work with Mac OS 8.0" but I updated to 8.1 and still get the message.
This article has been archived and is no longer updated by Apple.
Desktop printer Utility is not currently supported under Mac OS 8.0. Therefore, if you are running Mac OS 8, this error message is correct. You should upgrade to Mac OS 8.1 or later for access to Desktop Printer Utility.

If you are running any other system software version such as 7.6.1 or 8.1 and you encounter this error message, be certain you have the desktop printer spooler and desktop printmonitor active in the extensions folder. Having these extensions disabled will cause the misnomer to occur.
Published Date: Feb 20, 2012

Motion 2.1: Rendering issues in 16-Bit projects on Mac Pro

This article has been archived and is no longer updated by Apple.

Issue or symptom

Motion 2 supports the following project bit depths:

- 8-Bit integer
- 16-Bit Float
- 32-Bit Float

When working in 16-bit float on a Mac Pro with either the NVIDIA GeForce 7300 GT or the ATI Radeon 1900 XT, you may notice the following issues:

- Dark outlines on text or shape object edges
- Slight Luminance shifts
- Feather size grows when using multiple shapes

Solution

Avoid using 16-bit bit-depth if you are working with the above configuration.

For high quality rendering, use the 32-bit float setting in your Motion project. You can set the bit-depth of your project in the General pane of the Project Properties window.

To improve performance while working, turn off **Preview for Float Bit Depth** in the **View** pop-up menu. The **View** pop-up menu is located in the upper-right corner of the Canvas (below the Timing icon).

32-bit float rendering produces extremely fine color accuracy, eliminates banding artifacts, and even improves quality when rendering to 8-bit formats.

Additional information

Note: Motion 2.1 (Universal) is compatible with the Mac Pro. Motion 2.1 is available as part of Final Cut Studio 5.1. Upgrade options are available at http://www.apple.com/universal/crossgrade/.

This document will be updated as more information becomes available.

Mac OS X Server: Apple-specific postfix options

This article has been archived and is no longer updated by Apple.

These are the Apple-specific options for the Postfix main.cf configuration file:

- enable_server_options

  Valid options: yes, no
  Set this value to yes if you have set email auto-forwarding for any users who would normally receive mail locally via Work Group Manager.

- smtpd_use_pw_server

  Valid options: yes, no
  Set to yes if using Password Server, otherwise standard open source SASL authentication is used.

- smtpd_pw_server_security_options

  Valid options (one or more): login, plain, cram-md5, gssapi
  Set this option to the desired authentication method(s) you wish to enable for authenticated SMPT relay. This option is used in conjunction with smtpd_use_pw_server and is ignored if smtpd_use_pw_server is set to “no?.

Xsan 1.4: Security issues related to StorNext Windows clients in ACL environment

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Access Control List functionality in Xsan 1.4 is designed to be compatible with the ACL functionality in Quantum's StorNext file system for Microsoft Windows. However, file and folder permissions issues have been discovered in ACL-enabled Xsan environments where Windows StorNext and StorNextFX systems have been present, even if those systems are no longer part of the SAN.

Solution

If you intend to enable ACLs on your Xsan volume and currently have, or intend to have, the affected versions of Windows StorNext clients as part of the SAN, update the StorNext software to the latest version before enabling ACLs.

For Xsan installations that currently have, or have ever had, the affected versions of Windows StorNext clients as part of the SAN, it is suggested that you update the StorNext software to the latest version. In addition, to avoid any potential security concerns, it is suggested that you back-up all data on the volume, delete the volume, recreate the volume and restore the data.

Before introducing StorNext or StorNext clients to the SAN, be sure to update them to the latest version of Stornext or StorNextFX.

Mac OS X Server 10.3.9: "Download Files To:" field may not enforce certain settings when managing Internet preferences for a group

This article has been archived and is no longer updated by Apple.

Issue or symptom

When managing Internet preferences and web settings for a group, the "Download Files To:" field may not enforce certain settings. This can occur when specifying a group folder as the download location.

Solution

Add "/Volumes" to the beginning of the path.

For example, if the download path is /Groups/testgroup/ , change it to: /Volumes/Groups/testgroup/ .

Final Cut Pro: Send To Motion evokes QuickTime Player instead of Motion

This article has been archived and is no longer updated by Apple.

Issue

If you have designated QuickTime Player as Final Cut Pro's external editor for video files, you might find that the Send To Motion feature fails to open the resulting Motion project in Motion. Instead, the **.motn** project opens in QuickTime Player.

Solution

In the majority of workflows, it is not necessary to explicitly designate QuickTime Player as the external editor for video files. If you clear the setting so that no application is selected as the external editor for video files, Final Cut Pro will use the application that Mac OS X uses to open video files, which by default, happens to be QuickTime Player.

Follow these steps to clear the setting for external editors

1. In Final Cut Pro, choose **Final Cut Pro > System Settings**.
2. Click the **External Editors** tab.
3. Click the **Clear** button for Video Files to clear that setting.

This document will be updated when more information becomes available.

iPhoto: Issues using System Preferences Desktop picture feature

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some photos in your iPhoto library may not be accessible from the Desktop tab of the "Desktop & Screen Saver" pane of System Preferences if you have deselected the option to "Copy files to iPhoto Library folder when adding to library" in iPhoto preferences.

The "Change Picture" duration option at the bottom of the Desktop tab may not be available with some iPhoto albums.

Solution

To work around this issue, export the photos you want to use from iPhoto to a folder in your Pictures folder. Select this folder using the "Choose folder..." option in the Desktop tab of the Desktop & Screen Saver system preference pane.

Pro Apps Update 2006-02

This article has been archived and is no longer updated by Apple.

Pro Applications Update 2006-02 addresses several issues with underlying frameworks and shared components for Apple's professional applications and is strongly recommended for all users of Final Cut Studio 5.1, Final Cut Pro 5.1, Motion 2.1, Soundtrack Pro 1.1, DVD Studio Pro 4.1, LiveType 2.1, Compressor 2.3, Apple Qmaster 2.3, and Final Cut Express HD 3.5.

Pro Application Update 2006-02 updates the following components

HDVCodec

HDVCodec addresses performance fixes with certain decks and also improves video quality specifically superblack preservation.

This update is required for customers using Final Cut Pro 5.1 and above.

DVCProHDCodec

DVCProHDCodec addresses performance and stability issues.

This update is required for customers using Final Cut Pro 5.1 and above.

Uncompressed 422

Uncompressed 422 delivers a fix for some gamma/color shifts when moving clips between Final Cut Pro and Adobe After Effects. Video quality issues have been fixed and performance improvements have been achieved on Intel-based Macs.

This update is required for customers using Final Cut Pro 5.1 and above and recommended for customers using any of the Final Cut Studio 5.1 applications.

IMXCodec

IMXCodec delivers performance improvements, improved compatibility of encoded bitstreams specifically encoded frames now adhere strictly to the correct maximum size, and improved video quality specifically superblack preservation.

This update is recommended for Final Cut Studio 5.1 customers.

LiveType Support

LiveType support is updated for new development tools on Intel-based Macs.

This update is required for customers using Final Cut Pro 5.1 and above and Final Cut Express HD 3.5.

PluginManager, Fxplug, ProFX, and FxPlugWrapper

These shared components deliver Effects Support in Final Cut Pro 5.1.2.

This update is required for customers using Motion 2.1 and Final Cut Pro 5.1 and above.

Helium

Helium delivers a fix for using 4 processors on Quad Power Mac G5 computers.

This update is required for customers using Compressor 2.1 and above.

Requirements for this update

- Mac OS X 10.4.4 or later
- QuickTime 7.0.4 or later
- Motion 2.1.2 (if Motion is installed)

Where did my Music Videos go in iTunes 7?

This article has been archived and is no longer updated by Apple.

With the release of iTunes 7, music videos are no longer grouped with Movies in the iTunes source list. They are instead grouped with Music.

However, all of your music videos can be found in a new Music Videos Smart Playlist that automatically updates whenever you add another music video to your Library.

If you have deleted the Music Videos Smart Playlist, follow these steps to recreate it.

1. Open iTunes.
2. Choose **File > New Smart Playlist**.
3. Set rule to Video Kind is Music Video and click OK.

4. A new Smart Playlist will appear in the source list.
5. Rename the playlist to "Music Videos."

Logic Pro: Labeling Aggregate Device I/O

This article has been archived and is no longer updated by Apple.

When you create an Aggregate Device in Audio/MIDI setup, the names for inputs and outputs shown in Logic can sometimes be more generic than you might like. You can use Logic's I/O labels to name the inputs and outputs more clearly.

- Choose **Audio > Audio Configuration** from Logic's main menu.
- In the Audio Configuration window choose **View > I/O Labels**.
- For each input and output listed, select the button under "Long I/O Label." Double-click in the text box to the right of the button and type in the label you would like to use for the input or output. If you like, you can also type a Short I/O label name that Logic will use when there's not enough room to display the full long name.

The I/O labels will be used for all songs, there is no need to create them more than once, unless you decide to change the label names.

Logic Pro quits during startup while Updating Tree

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you launch Logic Pro, it may quit unexpectedly at the point where the startup screen progress indicator says "Updating Tree".

Solution

This behavior indicates an issue with the Project Manager database. Go to ~/Library/Preferences/Logic (where "~" represents your user folder) and drag the folder named "PM Data" to the Trash.

After you delete the "PM Data" folder, you'll need to rebuild the Project Manager database. See page 421 of the Logic Pro Reference manual for details.

This document will be updated as more information becomes available.

Server Assistant temporarily changes local machine‘s time zone when creating a config file

This article has been archived and is no longer updated by Apple.

Issue or symptom

When using Server Assistant to "Save setup information in a file or directory record," the time zone on the local machine may be temporarily changed.

Solution

The time zone should revert to the original setting after Server Assistant finishes. If it does not revert, reset it using Date & Time preferences.

Published Date: Feb 20, 2012

Mac OS X Server 10.4 (Japanese): Kotoeri keyboard layout not available in Server Assistant "Keyboard" pane until restart

This article has been archived and is no longer updated by Apple.

Issue or symptom

When upgrading Mac OS X Server 10.3.x to Mac OS X 10.4 Server using CD installation media, the Kotoeri keyboard layout may not appear in the "Keyboard" pane of Server Assistant.

Solution

Restart the server. The Kotoeri keyboard layout should become available.

Intel-based Macs: Some applications unexpectedly quit while printing using an SMB home directory

This article has been archived and is no longer updated by Apple.

Issue or symptom

While logged in using an SMB-based network home directory, applications that are not Universal, or Universal applications that are forced to run with Rosetta may unexpectedly quit when printing.

Solution

This does not occur when using an AFP-based network home directory, however if AFP is not available, use this workaround to print from affected applications:

1. Choose **Print** from the **File** menu.

2. Set desired print options.

3. Click Preview.

4. Click Print in the Preview window.

This document will be updated as more information becomes available.

Adjusting brightness on the Fifth Generation iPod

This article has been archived and is no longer updated by Apple.

You can adjust the brightness of the display for Fifth Generation iPod models (also known as iPod with video). To use this feature ensure that you have one of the following iPods and have updated to the latest version of iPod software:

- Fifth Generation iPod
- Fifth Generation iPod (Late 2006)

To adjust the brightness of an iPod's display, select **Settings > Brightness** and use the Click Wheel to move the slider. Move the slider to the left to dim the screen, move it to the right to increase the brightness.

Your iPod's brightness level will have a direct impact on battery life. By lowering the brightness level, you can increase the iPod's playback time. It is possible to adjust iPod's brightness level while watching a slideshow or a video.

To adjust brightness while viewing a slideshow

1. Start the slideshow.
2. Press the Center button.
3. When the brightness bar appears, use the Click Wheel to change the brightness of the display.
4. Press the Center button when the brightness level is to your liking or wait 2 seconds and the change will take effect on its own.

To adjust brightness while viewing a video

1. Start the video.
2. Press the Center button twice.
3. When the brightness bar appears, use the Click Wheel to change the brightness of the display.
4. Press the Center button when the brightness level is to your liking or wait 2 seconds and the change will take effect on its own.

Note: The brightness setting on the iPod only affects the iPod display. If you are viewing a slideshow or video on a television, use the brightness controls on the television instead. Within each iPod Game purchased from the iTunes Store, you can also adjust the brightness setting.

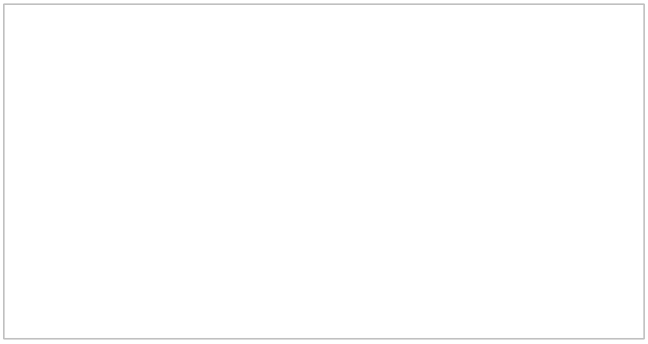
Update to iOS 12

Enjoy a faster and more responsive experience as well as fun new features, like Memoji and Camera Effects.

Get iOS 12



Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

Watch. And Learn.

iPod: Ignoring battery warnings could result in loss of saved game and high score

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you're playing a purchased game on your iPod and the battery is depleted, the game in play and any potential high score will be lost.

Solution

Check your battery icon occasionally while playing a game. If the icon turns red, connect power immediately. If you play until no power remains, the current game's state (and its potential high score) will be lost.

Note: Not all games display the battery icon at all times. Some have the option of turning it on or off. Some only display the battery in the menus.

It is best to charge your iPod fully before playing a game.

Aperture: New default Toolbar icons not displayed

This article has been archived and is no longer updated by Apple.

Issue or symptom

Aperture 1.5 offers a new set of default Toolbar icons, but in some cases they may not appear.

Solution

If you customized your Toolbar in a previous version of Aperture, then the new Toolbar icons will not display by default when you upgrade to version 1.5. There are two ways to resolve the issue:

Option 1

- Control-click the Toolbar and choose **Customize Toolbar** from the shortcut menu.
- Drag the icons you'd like to display from the icons dialog to the Toolbar.
- Click **Done** in the icons dialog.

Option 2

Please note that the this method will reset all of your Aperture preferences to their default settings.

- Quit Aperture if it is running.
- Go to `~/Library/Preferences` (where "~" represents your User folder.) and drag the file `com.apple.Aperture.plist` to the Trash.
- Launch Aperture.

iWeb: Vertical lines may cause Internet Explorer to quit

This article has been archived and is no longer updated by Apple.

Issue or symptom

Vertical lines used in an iWeb web page can cause Internet Explorer 6 on Windows to unexpectedly quit while loading the published page. The issue only occurs with lines that have a width of 1 point or less.

Solution

This issue does not occur when viewing iWeb pages with the Firefox browser on Windows or with any Mac browsers.

You can avoid this issue while creating your site in iWeb by using vertical lines in your page design with a line width greater than 1 point. You can adjust line width in the Graphic Inspector.

This document will be updated as more information becomes available.

Backup 3: Use caution when backing up to CD-RW or DVD+-RW

This article has been archived and is no longer updated by Apple.

SUMMARY:

Discusses a potential data loss issue with Backup

DISCUSSION:

Backup 3 performs incremental backups, backing up only files that have changed since your last backup. This also occurs if you are backing up to a CD-RW or DVD±RW.

If you performed a backup to a CD-RW or DVD±RW, and later wish to backup changes that have occurred in your backup set to the same disc, you should do another Full Backup, rather than a normal backup. Doing a normal backup may lead to you inadvertently not having a back up any files in your back up set that have no changed.

To perform a full backup, select **Plan** > **Full Backup**.

About the security content of QuickTime 7.1.3

This article has been archived and is no longer updated by Apple.

This document describes the security content of QuickTime 7.1.3E, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

QuickTime 7.1.3 Update

- **QuickTime**

  CVE-ID: CVE-2006-4381, CVE-2006-4386

  Available for: Mac OS X v10.3.9 and later, Windows XP/2000

  Impact: Viewing a maliciously-crafted H.264 movie may lead to an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt H.264 movie, an attacker can trigger an integer overflow or buffer overflow which may lead to an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of H.264 movies. Credit to Sowhat of Nevis Labs, Mike Price of McAfee AVERT Labs, and Piotr Bania for reporting these issues.

- **QuickTime**

  CVE-ID: CVE-2006-4382

  Available for: Mac OS X v10.3.9 and later, Windows XP/2000

  Impact: Viewing a maliciously-crafted QuickTime movie may lead to an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt QuickTime movie, an attacker can trigger a buffer overflow which may lead to an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of QuickTime movies. Credit to Mike Price of McAfee AVERT Labs for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2006-4384

  Available for: Mac OS X v10.3.9 and later, Windows XP/2000

  Impact: Viewing a maliciously-crafted FLC movie may lead to an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt FLC movie, an attacker can trigger a heap buffer overflow which may lead to an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of FLC movies. Credit to Ruben Santamarta of reversemode.com working with the iDefense VCP Program, and Mike Price of McAfee AVERT Labs for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2006-4388

  Available for: Mac OS X v10.3.9 and later, Windows XP/2000

  Impact: Viewing a maliciously-crafted FlashPix may lead to an application crash or arbitrary code execution

  Description: By carefully crafting a corrupt FlashPix file, an attacker can trigger an integer overflow or buffer overflow which may lead to an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of FlashPix files. Credit to Mike Price of McAfee AVERT Labs for reporting this issue.

- **QuickTime**

CVE-ID: CVE-2006-4389

Available for: Mac OS X v10.3.9 and later, Windows XP/2000

Impact: Viewing a maliciously-crafted FlashPix may lead to an application crash or arbitrary code execution

Description: By carefully crafting a corrupt FlashPix file, an attacker can trigger an exception leaving an uninitialized object. This may lead to an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of FlashPix files. Credit to Mike Price of McAfee AVERT Labs for reporting this issue.

- **QuickTime**

CVE-ID: CVE-2006-4385

Available for: Mac OS X v10.3.9 and later, Windows XP/2000

Impact: Viewing a maliciously-crafted SGI image may lead to an application crash or arbitrary code execution

Description: By carefully crafting a corrupt SGI image, an attacker can trigger a buffer overflow which may lead to an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of SGI image files. Credit to Mike Price of McAfee AVERT Labs for reporting this issue.

- **QuickTime**

CVE-ID: CVE-2007-0754

Available for: Mac OS X v10.3.9 and later, Windows XP/2000

Impact: Viewing a maliciously-crafted QuickTime movie may lead to an application crash or arbitrary code execution

Description: By carefully crafting a corrupt QuickTime movie, an attacker can trigger a buffer overflow which may lead to an application crash or arbitrary code execution with the privileges of the user. This update addresses the issue by performing additional validation of QuickTime movies. Credit to Ganesh Devaraja of TippingPoint DVLabs for reporting this issue.

Final Cut Pro: Avoid using both drop frame and non-drop frame timecode on the same tape

This article has been archived and is no longer updated by Apple.

Capturing from tapes recorded with both drop frame and non-drop frame timecode may produce unexpected results. In some cases, the timecode on the resulting clips may be inaccurate. Inaccurate timecode on captured clips can negatively impact subsequent workflow steps, such as re-capturing, using Media Manager, or exporting reliable EDL or XML files from affected projects.

Solution

Before shooting or recording your source tape, plan to use either drop frame or non-drop frame timecode for the entire tape.

If you are working with a tape that already contains sections of both drop frame and non-drop frame timecode, avoid using the Capture Now feature to capture the entire tape in one operation. Instead, try treating each section of different timecode as if it were a separate tape.

In other words, the clip(s) you acquire in a single capture operation should only come from within a contiguous section of either drop frame or non-drop frame timecode. After you have captured the desired media from a section, shuttle the tape into the next section of timecode, and begin capturing from within that one, and so on.

Background: About Drop Frame and Non-Drop Frame Timecode

When working with NTSC video, you have the option to use drop frame timecode to compensate for the fact that NTSC video has a frame rate of 29.97 fps, while the timecode runs at 30 fps. Timecode can only be represented by whole numbers, so drop frame timecode periodically skips numbers so that the timecode count and the amount of actual time passed stays in sync. This way, the timecode count matches the the number of hours, minutes, and seconds that it takes for your video footage to play. NTSC video can use either drop frame or non-drop frame timecode.

Note: No video frames are dropped when you use drop frame timecode. Only the associated timecode numbers are skipped.

For more information on the subjects discussed in this document, refer to the Final Cut Pro User Manual, available under the Help menu in Final Cut Pro.

Boot Camp Beta: MacBook, MacBook Pro - Built-in display stays on after lid is closed

This article has been archived and is no longer updated by Apple.

Issue or symptom

While running Microsoft Windows XP using Boot Camp Beta, the built-in display of your MacBook or MacBook Pro computer may remain on when the display lid is closed and an external display is connected.

Solution

To disable the internal display while running Windows XP:

1. From the **Start** menu, select **Control Panel**.
2. Open Display settings.
3. Click the Settings tab, then Advanced, to bring up the ATI settings.
4. Click the Displays tab.
5. Click the "disable flat panel display" button under Panel.
6. Click Apply.

The built-in display of your MacBook or MacBook Pro should now be disabled while in Windows XP. It is expected behavior for the display to be off when the lid is closed.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: How to combine RAID sets in Disk Utility

This article has been archived and is no longer updated by Apple.

This article applies to Mac OS X 10.4 or later and Disk Utility version 10.5 or later (included with Mac OS X 10.4 Tiger).

RAID sets can be combined in a variety of ways to increase their usefulness. For example, you can create a RAID 10 set by combining a mirrored RAID and a striped RAID. This would allow you to combine the fast disk access of a striped RAID set (RAID 0) with the data protection features of a mirrored RAID set (RAID 1).

To combine RAID sets:

1. Create three blank RAID schemes in Disk Utility (two mirror and one stripe, or two stripe and one mirror).
2. Drag two of the drives to the first set.
3. Drag the other two drives to the second set.
4. Then in the RAID window drag the first and second set into the third scheme.
5. Click Create.

Front Row: Black screen when using video mirroring and display rotation

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you use an external display rotated to 90 or 270 degrees and you enable video mirroring on that display, you may notice that Front Row doesn't present as expected. Instead, you see a black screen on the external display.

Solution

If you need to use Front Row with two displays, either use extended desktop mode or rotate your external display at either 0 or 180 degrees.

Click here for more information about the display rotation feature.

This document will be updated as more information becomes available.

LaserWriter 8500: Chicago Accented Characters not Printing

The LaserWriter 8500 doesn't print accented characters, umlaut, cedilla, grave accent .. etc., when using the Chicago TrueType font. If I use a different font, these characters print correctly.
This article has been archived and is no longer updated by Apple.
Was an issue with older versions of Chicago and Geneva such as those versions that shipped with Mac OS 8.1. The newer correct fonts ship on the LW 8500 CD and newer versions of the Mac OS including Mac OS 8.5.

Workarounds:

1) Replace the Chicago TrueType font in your Fonts folder with the version that shipped on the CD-ROM disc for your LaserWriter 8500 or a Mac OS 8.5 CD.
2) Use the Apple Printer Utility to download the Chicago TrueType font to the printer.

Logic Pro and Logic Express: No sound with Mac Pro

This article has been archived and is no longer updated by Apple.

Issue or symptom

Logic does not output sound when you use the built-in audio hardware on the Mac Pro.

Solution

Versions of Logic prior to 7.2.3 are not compatible with the built-in audio hardware on the Mac Pro — they do not allow the outputs to be assigned in Logic's **Audio > Audio Hardware & Drivers** window.

Logic Pro and Logic Express 7.2.3 provides access to all three outputs available on the Mac Pro:

- Built-in Output (the speaker)
- Built-in Line Output (the line out jack on the back of the Mac Pro)
- Built-in Digital Output (the optical audio output on the back of the Mac Pro)

Power Mac G5 (Late 2005), iMac G5 (Ambient Light Sensor): FireWire bus stops responding after computer restarts with FireWire audio device attached

This article has been archived and is no longer updated by Apple.

Issue or symptom

If a FireWire audio device is connected to a Power Mac G5 (Late 2005) or an iMac G5 (Ambient Light Sensor) while the computer is restarting, the FireWire bus will stop responding and no FireWire devices will be detected on the bus. The device may stop responding or stop charging, depending on the specifics of the device.

Products affected

- FireWire device
- Power Mac G5 (Late 2005)
- iMac G5 (Ambient Light Sensor)

Solution

You can restore the Firewire bus by resetting the SMU (System Management Unit). To learn how to reset your particular computer SMU please see:

301733: "**iMac G5: How to Reset the SMU**"
300341: "**How to reset the SMU on a Power Mac G5 (Late 2004) or Power Mac G5 (Late 2005)**"

Published Date: Oct 11, 2016

Apple portables: Some key combinations may not be recognized

This article has been archived and is no longer updated by Apple.

Some key combinations that may work on standard keyboards may not be recognized on Apple's portable computers. This includes combinations containing more than four keys and some combinations of three keys across the home row (asdfghjkl;').

This is done to avoid an issue with modern keyboards called "phantom keys". Phantom keys occur when the controller reports a key to be down that is not really down. To avoid this, the controller will stop sending keycodes if key combinations are pressed simultaneously that can cause this condition—combinations like more than four keys or some combinations of three home-row keys.

If you require the use of combinations that are not possible with the Apple portable computers' built-in keyboard, you can connect an external keyboard to the computer. Since the matrix used on external keyboards is different, they will allow different key combinations that aren't available on built-in keyboards.

Intel-based Mac may become unresponsive in target disk mode

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some Intel-based Macs can become unresponsive while being used in FireWire target disk mode for long periods of time. The FireWire icon will stop moving, and the disk cannot be accessed from another Macintosh computer over FireWire.

Solution

This behavior can be corrected with a firmware update to the computer that becomes unresponsive while in Target Disk Mode. Startup that computer into Mac OS X, then follow the instructions in this article.

Power Macintosh: Display Resolutions in the Monitors & Sound control panel

We have several Power Macintosh computers in our office and we have a mixture of Apple displays computers running different versions of the Mac OS.

When we go into the Monitors & Sound control panel on our different computers, we notice that we each get different display resolution options.

1. How does the Monitors & Sound control panel know which display resolutions are available?
2. How can we tell which display resolutions should appear as options in the Monitors & Sound control panel?
3. What is the difference between "Recommended" and "All" display resolutions in the Monitors & Sound control panel?
4. Why does Apple include both Macintosh and VGA or VESA resolutions on Power Macintosh computers?

This article has been archived and is no longer updated by Apple.

Question: How does the Monitors & Sound control panel know which display resolutions are available?

Answer: The Monitors & Sound control panel depends on a component of the Mac OS called the Display Manager. The Display Manager allows you to dynamically change the arrangement and display modes of the displays attached to the computer.

The video device driver is also responsible for telling the Display Manager what display modes are available. In determining what type of display is attached to your video port, device drivers usually examine the display's sense code. A device driver can associate each sense code with a default display mode and a set of required and optional display modes for the display.

The latest version of the Apple Displays software at the time of this writing is version 1.7.1. This software is available from the Apple Software Updates Web site at http://www.apple.com/swupdates. For more detailed information regarding the Display Manager and video device drivers, refer to the Display Device Driver Guide and Display Manager documentation available on Apple's Developer Web site at http://www.apple.com/developer.

Question: How can we tell which display resolutions should appear as options in the Monitors & Sound control panel?

Answer: Most Power Macintosh computers ship with a Technical Information booklet that details the video modes supported by that particular computer. In some cases, this information is provided as a section in the User's Manual/Guide. This information should tell you what resolution and screen refresh rates your computer is capable of. With this information, you can check with your display's documentation to see what resolutions and refresh rates it supports.

As long as the computer and display's supported resolutions and refresh rates match, these resolutions and refresh rates should appear in the Monitors & Sound control panel under "Recommended" or "All" display resolutions. If these resolutions do not, you may not have the correct display software installed on your computer or the display may not be properly connected to the computer.

Question: What is the difference between "Recommended" and "All" display resolutions in the Monitors & Sound control panel?

Answer: In most cases, you will want to select from the Recommended choice of resolutions. These resolutions are known to work well with the monitor attached to your computer. Also, these are also the required and default display modes for your computer. All required display modes appear when the user opens the Monitors and Sound control panel. For a particular type of display (for example, a 21-inch video monitor), a required display mode is one that Apple requires the display to support.

On some Macintosh and Power Macintosh computers, users can choose All resolutions from the Monitors & Sound control panel to reveal additional resolutions that your monitor might also support. This might be useful if your computer provides video output or video mirroring to a TV or VCR. Some resolutions that appear under "All" may look better than those that are recommended. Some of these resolutions that appear under "All" might cause the picture to flicker or be distorted. If you choose a resolution from the list, and your monitor goes black, wait a few seconds and it will return to its previous setting.

Question: Why does Apple include both Macintosh and VGA (Video Graphics Array)/VESA (Video Electronics Standards Association) resolutions on Power Macintosh computers?

Answer: Most of the recent Power Macintosh computers are compatible with Windows-based VGA/VESA displays in addition to Apple displays. If our Power Macintosh computers only supported Macintosh resolutions, customers would have less of a choice in the displays they use.

Additionally, most of the recent Apple Displays are cross-platform displays that can be used on both Macintosh and PC computers. This is why you will see both Macintosh and VGA/VESA resolutions appearing on some Power Macintosh computers when an Apple Display is connected.

Mac OS X 10.3 or later: About automatic PostScript-to-PDF conversions

This article has been archived and is no longer updated by Apple.

Mac OS X 10.3 or later automatically converts PostScript (.ps) or Encapsulated PostScript (.eps) files to PDF when viewing in Preview, Mail, or certain third-party applications. The conversion process typically takes a short period of time (depending on the complexity of the file), and may take longer for the first conversion within each user account. Any subsequent PostScript files viewed by the same user should be converted to PDF faster than the first time.

The conversion process may also be noticeably slower if the com.apple.psnormalizer files are removed from /Library/Caches.

A delay may be noticed the first time any user of the computer prints a PostScript file by dragging it onto the icon of a non-PostScript printer. However, there should be no additional delay the next time any user of the computer prints a PostScript file this way.

Mac OS X 10.3 or later: Close System Preferences after changing location for saved faxes

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you use the Print & Fax pane of System Preferences to change the location where received faxes are saved, but you leave the Print & Fax pane open, received faxes may not get saved correctly if the target folder does not already exist.

Solution

After changing the location where received faxes should be saved, close the Print & Fax pane of System Preferences by clicking the Show All button or by quitting System Preferences. This ensures that the folder you specified as the saved fax location will be created.

This document will be updated as more information becomes available.

iTunes for Mac cannot launch after repairing with Norton Disk Doctor

This article has been archived and is no longer updated by Apple.

Issue or symptom

iTunes for Macintosh cannot launch after using Norton Disk Doctor.

Norton Disk Doctor reports the following:

> A major error was found in the file listed below. The BSD mode for the symbolic link is incorrect. Symbolic links are special files similar to aliases. (15, 20)
>
> HARD DRIVEA:Applications:iTunes.app:Contents: Frameworks:iPodUpdater.framework:Versions:A:iPodUpdater

Solution

While you can run Norton Disk Doctor, make sure you do not chose to repair this error. If you repair the error, you will need to reinstall iTunes.

Contact Symantec for further information.

Aperture: Changes to keyboard shortcuts in version 1.5

This article has been archived and is no longer updated by Apple.

Some of the keyboard shortcuts in Aperture have changed in version 1.5. Here's a summary of what's different:

Applying Ratings to images

In previous versions, the shortcuts to apply ratings were **Command–Option–** ***rating number 1-5*** (i.e. **Command–Option–3** to apply a three star rating). This is now simply ***number 1-5*** (press the 3 key to apply a 3 star rating). It is also possible to apply ratings by using **Command–*number 1-5***, which matches the keyboard shortcuts for rating images in iPhoto."

The shortcuts to increase and decrease ratings have also changed:

- To decrease the rating press **Command–-** (the previous shortcut **-** will also work).
- To increase the rating press **Command–=** (the previous shortcut = will also work).

Some keyboard shortcuts dealing with applying a rating of *reject* have changed:

- To apply a rating of *reject* to an image use **Command–9** (was previously **0**).
- To apply a rating of *reject* and select the next image, press **Control–9** (was previously **Control–0)**.
- To apply a rating of *reject* to a compared imaged, press **Option–9** (was previously **Option–0**).
- To apply a rating of *reject* and clear the last rating applied, press **Shift–9** (was previously **Shift –0**).

Keywords

In previous versions, keywords from the Keyword buttons on the Control Bar were assigned using the **1-9** number keys. In Aperture 1.5 this is done using **Option–1-9**. In Aperture 1.5, the keyboard shortcuts **1-9** are an alternate way of applying ratings to images.

To add a new keyword, press **Option–`** (was previously **9**).

To remove keywords from images, press **Option–Shift–*keyword number*** (i.e. **Option–Shift–4** to remove the keyword from button 4). This was previously done with **Shift–*number 1-8***.

To remove all keywords press **Option–Shift–9** (was previously **Shift–9**).

To summarize, **Option** has been added to all the keyboard shortcuts for working with keywords.

Changes to Built-in Layouts

The built-in layouts in Aperture 1.5 have been simplified. There are now three built-in layouts:

- *Display Basic* (previously known as *Display Standard*): **Option–Shift– S**
- *Display Viewer*: **Option– Shift –V**
- *Display Browser*: **Option–Shift–B**

The following layouts have been removed:

- *Display Ratings and Keywords*: **Option–Shift–R**
- *Display Adjustments and Filters*: **Option–Shift–F**
- *Display Project Management*: **Option–Shift–M**

Note that if you configured buttons in the toolbar for any of the above layouts, the buttons will continue to work, although the associated keyboard shortcuts will not. If you remove a button for a legacy layout in Aperture 1.5, there is no way to get it back.

Control Bar and Inspectors

In previous versions the Control Bar was toggled with **Shift–D**. This is now done simply with **D**. **Shift – D** now toggles the Keyword buttons on the Control Bar.

To show Archive in the Metadata Inspector, press **Control–R** (was previously **Control–A**).

To toggle the Adjustments Inspector, press **Control–A**.

Loupe Controls

The keyboard shortcuts to adjust the size of the Loupe have changed:

- The shortcut to decrease the Loupe size is **Option**–_ (was previously **Command**–-).
- The shortcut to increase the Loupe size is **Option**–+ (was previously **Command**– =).

To switch between the new Centered Loupe and the classic Loupe, press **Command**–~.

To detach the Loupe from the cursor (classic Loupe only), press ~.

iTunes 7: How to improve performance while burning or ripping CDs

This article has been archived and is no longer updated by Apple.

Symptom

If you have a large music library, you may notice that iTunes 7 performance might be slow when you first open iTunes or when you are burning or ripping an audio CD.

Solution

Update to iTunes 7.0.1 or later to resolve this issue.

Published Date: Oct 7, 2016

Aperture: New Vault Contents sometimes shows more files than expected

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you create a vault, the New Vault Contents dialog sometimes indicates there are more referenced files than you expected.

Solution

This happens when you shoot RAW+JPEG and store the images outside the Aperture Library. The New Vault Contents dialog counts both the RAW and the JPEG copy of each referenced image.

Published Date: Oct 7, 2016

Aperture: Pixel Grid in Loupe sometimes not available

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Pixel Grid option is sometimes dimmed in the **View > Show Pixel Grid in Loupe** menu. You may also see this happen in the **Loupe** pop-up menu.

Solution

The Pixel Grid is only available with Loupe magnification settings of 400% or greater. At lower settings, the option is dimmed.

Mac OS X 10.4: Close printer queue window before printing from Classic

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you have a printer queue window open when printing from a Classic application, the print job may not print or appear in the printer's queue.

Solution

Make sure the printer's queue window is not open and the printer's icon is not on the Dock with a triangle by it (indicating it is open).

After closing the printer's queue window or quitting the printer queue application shown on the Dock, try printing from Classic again.

Additional information

Mac OS X 10.4 or later allows Classic applications to print to printers that were added in Mac OS X without installing printer drivers in Classic or selecting the printer in Chooser.

This document will be updated as more information becomes available.

Published Date: Oct 7, 2016

Mac OS X 10.4: Printer sharing also shares fax modems

This article has been archived and is no longer updated by Apple.

Issue or symptom

When Printer Sharing is enabled in Sharing preferences or "Share these printers with other computers" is selected in the Sharing tab of Print & Fax preferences, any fax modems in your Fax List will also be shared with other computers in your local network.

This happens even if "Let others send faxes through this computer" is disabled in the Sharing tab of Print & Fax preferences.

Solution

If you do not want to share your fax modem with other computers in your local network you can do one of the following:

- Turn off Printer Sharing in Sharing preferences. This will also stop sharing your printers with other computers in your local network.
- Or, remove the fax modem from the Fax List, in Printer Setup Utility (located in /Applications/Utilities):

    1. Click "Set Up Fax Modem..." in the Faxing tab of Print & Fax preferences, or select **Show Fax List** from the **View** menu in Printer Setup Utility.
    2. Select any modems you do not want to share in the list and click Delete.

Note: The next time you send a fax from your computer, your fax modem(s) will automatically be added back to the Fax List--you must remove them again from the list after sending a fax to stop sharing them with other computers in your local network.

This document will be updated as more information becomes available.

About the Xsan 1.4.1 update

This article has been archived and is no longer updated by Apple.

There are two updates for Xsan 1.4.1: "Xsan 1.4.1 Update for 10.4" and "Xsan Admin 1.4.1 Update". These are available from both Apple Downloads and Software Update.

Important: Read before continuing

Before installation

- Xsan 1.1 or later is required in order to install Xsan 1.4.1.
- If you are setting up a new Xsan deployment, please see this article for the proper installation order.
- Be sure that all Metadata Controllers (MDCs) are updated before you make any configuration changes.
- Before installing, please review the Xsan Migration Guide.
- During installation, do not change any Xsan settings using Xsan Admin or a command-line tool.

After Installation

To prevent an inconsistent volume state, run the `cvfsck` command on each Xsan volume after the MDCs have been updated with Xsan 1.4.1 Update.

Metadata Controller (MDC) software version

Your MDCs must always have software versions (both Xsan and Mac OS) that are the same or more recent than the most recent client versions. Specifically, if *any* client in your Xsan network is using Xsan 1.4.1 with Mac OS X 10.4.8 or later, then your metadata controllers (MDCs) must also be updated to Xsan 1.4.1 on the same version of Mac OS X.

Software Update Installation

Software Update may have referred you to this document. Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, use the softwareupdate command-line tool.

Hardware Requirements

- Xserve or Xserve G5
- Mac Pro
- Power Mac G5 (any)

Storage Network Requirements

- Apple Fibre Channel PCI, PCI-X, or PCI-E Card

Compatibility Matrix

See Xsan: Compatibility of SAN clients with Xsan and StorNext controllers.

What's new in Xsan 1.4.1

Xsan 1.4.1 Update for 10.4

The Xsan 1.4.1 update improves reliability and is recommended for all systems running Mac OS X or Mac OS X Server version 10.4. It includes fixes for:

- Reliable metadata controller failover
- Using file system access control lists (ACLs)
- Labeling and initializing LUNs greater than 2TB in size
- AFP and NFS performance when re-sharing Xsan volumes
- Handling file system quotas and notifications
- Compatibility with Apple and third party applications

TA24380_About_the_Xsan_update.pdf

If you will be updating a SAN containing heterogeneous (Intel and PowerPC) Metadata Controllers (MDCs), please read this article.

Xsan Admin 1.4.1 Update

The Xsan 1.4.1 updatedelivers overall improved reliability for remotely administering, configuring and maintaining Xsan deployments. It includes fixes for:

- Labeling and initializing Fibre Channel LUNs larger than 2TB in size
- Expanding storage pools and volumes
- Working with multiple Xsan metadata controllers in a heterogeneous environment
- Displaying progress messages while performing lengthy operations
- Preventing custom configuration changes from being overwritten during a save
- Accurately reporting Fibre Channel multipathing errors

Xsan 1.4 Uninstaller

The Xsan 1.4 Uninstaller removes Xsan, the Xsan Admin application, and Xsan documentation files. The Xsan 1.4 Uninstaller is appropriate version to use when uninstalling Xsan 1.4.x installations and can be obtained from Apple Downloads, or can be found on the Xsan 1.4 installer media.

Note: Before removing Xsan, you should back up all of your data and volumes.

Xsan 1.4 documentation

Xsan 1.4.x administrators can find Xsan 1.4 documentation here.

Mac OS X 10.4.8: Some content will not play in older QuickTime Player versions

This article has been archived and is no longer updated by Apple.

Mac OS X 10.4.8: Some content will not play in older QuickTime Player versions

After applying the Mac OS X 10.4.8 Combo Update on an Intel-based Mac, older versions of QuickTime Player may fail to handle some content as expected. In this situation, movies display only blank, white video, and no audio is heard. Image files may also appear as blank in QuickTime Player.

Affected media types include:

- .mov
- .mp4
- .m4v
- .jpg
- .png

Solution

Update QuickTime to 7.1 or later. You can get QuickTime updates from the QuickTime web site, or by using Software Update, available under the Apple menu.

Logic Pro: Logic Pro 7.2.3 offers optimized audio I/O Support on Mac Pro

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some audio I/O combinations on the Mac Pro are not available in the **Audio Hardware & Drivers** window under Logic Pro 7.2.0 and 7.2.1.

Solution

Updating from Logic Pro 7.2.0/7.2.1 to Logic Pro 7.2.3 gives access to all audio I/O combinations on the Mac Pro.

Published Date: Feb 20, 2012

Aperture: Some XMP sidecar files contain no metadata

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some XMP sidecar files generated by Aperture may contain no metadata when opened in other applications.

Solution

This occurs when the IPTC field *Urgency* is populated with alphabetical characters. Aperture 1.5 does not allow non-numeric characters to be entered into the *Urgency* field, but projects created in previous versions may have non-numeric characters there. Replace any alphabetical characters in the *Urgency* field with numeric characters, or simply leave the field empty before exporting XMP sidecar files.

This issue is resolved in Aperture 1.5.1. If the *Urgency* field contains non-numeric characters, it is not exported to XMP sidecar files. All Aperture 1.5 users are encouraged to update to version 1.5.1 to take advantage of this, and many other enhancements. For more details on what is changed in Aperture 1.5.1, click here.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Aperture: Media Browser continues to show previews after sharing is disabled

This article has been archived and is no longer updated by Apple.

Issue or symptom

Photos from the Aperture library are still visible in other applications' Media Browser after you disable the **Share previews with other applications** preference in Aperture.

Solution

This is expected behavior. Existing previews in the Aperture will continue to be visible, but new photos from Aperture will not.

This issue is resolved in Aperture 2.x.

Published Date: Oct 7, 2016

Final Cut Studio doesn‘t display or import Flash content after upgrading to QuickTime 7.3.1

This article has been archived and is no longer updated by Apple.

Issue or Symptom

- You may be unable to open or import Flash media elements in Final Cut Studio.
- Existing projects that contain Flash elements may not perform as expected, or may appear to be missing elements.

Products affected

- Final Cut Studio
- QuickTime 7.3.1

Solution

Flash is not supported in QuickTime 7.3.1. Use QuickTime-based movie formats in Final Cut Studio applications.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

PowerBook G4 and Apple Cinema Display (30-inch DVI) resolutions

This article has been archived and is no longer updated by Apple.

When you connect an Apple Cinema Display (30-inch DVI) to a PowerBook G4, you may find that the highest available resolution is 1280 x 800, even though the optimum resolution for the display is 2560 x 1600.

This is normal unless you are using a PowerBook G4 that comes equipped with a dual-link DVI port, such as:

- PowerBook G4 (15-inch Double-Layer SD)
- PowerBook G4 (17-inch Double-Layer SD)
- PowerBook G4 (15-inch 1.67/1.5GHz)
- PowerBook G4 (17-inch 1.67GHz)

These models were introduced in 2005 and come with the ATI Mobility Radeon 9700 video cards. Dual-link DVI ports were also available as Configure-to-order options in some other PowerBook G4 computers. Only these models of PowerBook G4 are able to support the optimum resolution for the Apple Cinema Display (30-inch DVI).

Power Macintosh G3: TV/FM Tuner Module Compatibility

Can I use the TV/FM Tuner card from my previous Macintosh computer in my new G3?
This article has been archived and is no longer updated by Apple.
No, the TV/FM Tuner module is not currently supported on either the Desktop or Minitower Power Macintosh G3 computer.
Published Date: Feb 20, 2012

Aperture: Some text from Copyright field missing in exported images

This article has been archived and is no longer updated by Apple.

Issue or symptom

In some cases, the end of the text from the IPTC *Copyright* field is missing when images are exported from Aperture and viewed in another application.

Solution

The *Copyright* field is limited to 128 characters in exported versions, although it is possible to enter more than 128 characters into the field in Aperture. If a master is exported with an XMP sidecar file (Aperture 1.5), then the *Copyright* field is not limited to 128 characters.

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Final Cut Pro 5.1.2 won‘t open after installing Motion 2.1

This article has been archived and is no longer updated by Apple.

Final Cut Pro 5.1.2 won't open after installing Motion 2.1

If you install Motion 2.1 *after* installing the Final Cut Pro 5.1.2 update, Final Cut Pro may subsequently fail to open.

Solution

To remedy this situation, take the following simple steps:

- From the **Apple menu**, choose **Software Update**.
- The Software Update panel will appear and will connect to the internet briefly. An item should appear in the list, named **"Pro Applications Update 2006-02 1.0"**.

- Click **Install** to install the update.

Additional information

This situation can occur if you install Motion 2.1 by running the installer found on the Final Cut Studio main installation disc. If you install Motion 2.1 by running the installer found on the Motion installation disc, the issue will not occur.

Published Date: Feb 20, 2012

Aperture: Elements of user interface do not match language setting

This article has been archived and is no longer updated by Apple.

Issue or symptom

After you change the language in the International preference pane to one of the supported languages in Aperture 1.5, Aperture's keyword button sets, Metadata Overlays, and Metadata pull-down menu retain the previous language. Also, the Viewer list view shows only the Version name for each image. These issues also occur when updating from Aperture 1.0/1.1 to 1.5 on a German, French or Japanese system.

Solution

Aperture does not overwrite existing keyword button sets when you upgrade or change the system language, to protect any custom sets you may have created. To reset the keyword button sets to the defaults using the current language setting, do this:

1. Quit Aperture if it's running.
2. Go to `~/Library/Preferences/` (where "~" represents your home folder).
3. Drag the `com.apple.Aperture.plist` file to the Trash.
4. Go to `~/Library/Application Support/Aperture`.
5. Drag the contents of `~/Library/Application Support/Aperture` to the Trash.
6. Open Aperture.

Note that you will lose any custom keyword button sets you have created, but any keywords already applied to images will remain.

Apple Wireless Mighty Mouse: Tracking light not visible

This article has been archived and is no longer updated by Apple.

Unlike previous Apple optical mice, you may notice that you can't see the tracking light on the Apple Wireless Mighty Mouse. This is normal.

The Apple Wireless Mighty Mouse uses a improved laser optical tracking system. Because the laser operates in the infrared part of the spectrum, it remains invisible the human eye. It also operates at such a low voltage that it is harmless if directed into the eye.

Click here for more details on the Apple Wireless Mighty Mouse.

Published Date: Oct 7, 2016

Aperture: System becomes unresponsive when external editor opens

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you send a large image from Aperture to an external editor, the computer may become unresponsive when the external editor starts to load.

Solution

This situation can occur when there is too little space available on the boot drive or partition. The reason this may happen is that some external editors copy the image to a temp directory on the boot drive/partition. The best way to avoid this issue is to maintain a healthy amount of free space on your boot volume. For information on other issues related to working with external editors see the following documents:

- Aperture: A large image "could not be located" when sending to external editor
- Aperture: Only one image opens when sending multiple images to Photoshop
- Aperture displays "Images Can't be Located" when sending files to an external editor.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Oct 7, 2016

Aperture: Compatibility Checker gives error for unsupported graphics card

This article has been archived and is no longer updated by Apple.

Issue or symptom

When run on an iMac G5 with a GeForce FX 5200 Ultra video card, the Aperture 1.5 Compatibility Checker shows the message

> "Your graphics card is not supported."

followed by

> "Error: The installed graphics card does not meet the minimum system requirements by Aperture."

Solution

This happens on iMac G5 1.6 Ghz systems. Aperture 1.5 requires an iMac G5 running at 1.8 Ghz or faster, but the Compatibility Checker erroneously indicates that the graphics card is the reason the computer is unsupported.

This issue is resolved in Aperture 1.5.1.

Replacement hard drives often require formatting before use

This article has been archived and is no longer updated by Apple.

Although replacement hard drives are often formatted and ready for use immediately after installation, you may find that your replacement hard drive doesn't appear as a valid volume for installing the OS.

Before assuming that there is an issue with your replacement drive, make sure it has been properly formatted by initializing the drive through the "Disk Utility" program. You may either start up from another volume like the Installation DVD that came with your computer, or launch "Disk Utility" from the menu of the Installer.

LaserWriter 8: LPR Printing May Be Slower Than AppleTalk

Print jobs sent over TCP/IP using the LPR protocol take longer to print than those sent over AppleTalk.
This article has been archived and is no longer updated by Apple.
LaserWriter 8 version 8.5.1 and later, includes an IP printing feature. This allows you to use the LPR protocol to print to many Apple LaserWriter printers over IP. The LaserWriter driver uses the LPR protocol to send PostScript print jobs to IP-enabled printers, allowing network administrators to integrate Apple LaserWriter printers into IP-only networks.

In most environments, printing over AppleTalk is the preferred network protocol for printing to PostScript printers. When using the LPR protocol, there are four situations that may cause print jobs sent over TCP/IP to take longer to print than those sent over AppleTalk. They are outlined below.

Situation 1
Printing is slower if MacIP is selected as the network connection instead of Ethernet in the TCP/IP control panel. Certain physical networks and dialup networking protocols, notably LocalTalk and Apple Remote Access Protocol (ARAP)-for dial up connections-cannot transmit TCP/IP. To allow TCP/IP connectivity over these networks, MacIP tunnels (wraps) the IP packets within AppleTalk packets so they can be transmitted across non-TCP/IP networks. The AppleTalk packets are received by a MacIP gateway that forwards the unwrapped IP packets to the destination.

Open the TCP/IP control panel and look the "Connect via" pop-up menu. If MacIP is selected then your print jobs are going from TCP/IP to AppleTalk and back to TCP/IP again. This requires additional time. If your network connection is not over LocalTalk or ARAP, then you should be able to set the "Connect via" pop-up menu to Ethernet to speed up communication.

Situation 2
Print jobs may take longer if you print to a print queue on a print server instead of printing directly to a printer. For optimal print performance, make sure your desktop printer is configured to print directly to the printer.

Situation 3
AppleTalk print jobs are optimized, and therefore smaller, so they require less time to be transmitted and processed by the printer.

At the beginning of each AppleTalk print job, the LaserWriter 8 driver opens a network connection to the printer and sends a query job to determine:

- PostScript language level compatibility (PostScript Level 1, 2 or 3)
- available file format (binary, ASCII)
- installed fonts

The LaserWriter driver uses the information it receives from the printer to optimize the AppleTalk print job. The LPR protocol cannot use this PostScript "backchannel" query mechanism. Because it does not know all of the printer's characteristics, the driver must make conservative assumptions about the printer's print and communications capabilities when creating a print job. This results in a print job that takes longer to transmit and print, but one that is more universally compatible.

In LaserWriter 8 version 8.7, which is part of Mac OS 9, LPR printer compatibility was enhanced. LaserWriter 8.7 examines the PPD file selected for your desktop printer to learn the printer's characteristics. The PPD includes information such as which fonts are present in the printer's ROM, if the printer has or is capable of using a TrueType rasterizer, if is it a color device, what product it is, its print resolution, its PostScript version, and what language level it can use. With this information, the LaserWriter 8.7 driver builds a more fully optimized LPR print job than earlier versions of the LaserWriter 8 driver. Despite this, an AppleTalk print job may be optimized to an even greater extent because of this protocol's use of the PostScript backchannel.

Situation 4
When the LaserWriter 8 driver prints over AppleTalk, it builds a print job using the full range of the possible eight-bit binary numbers, having a range of 0 to 255 possible byte values. Since not all printers work with this full binary range, only bytes in the ASCII range, 0 to 127, are used to insure compatibility under LPR, and many low control codes are avoided as well. Print jobs built using only values 0 to 127 are larger than print jobs that use the full range, and they take longer to transmit and process.

Fifth Generation iPod resets when playing some mono MP3 songs and podcasts

This article has been archived and is no longer updated by Apple.

Symptom

Some customers may experience an issue where a Fifth Generation iPod will reset when attempting to play certain MP3 files or podcasts encoded as MP3. This symptom may occur with any MP3 file encoded at 32Khz or higher with a mono channel.

Solution

Update to iPod Software 1.2.1 or later using the latest version of iTunes.

Published Date: Oct 7, 2016

Aperture: Folders or Projects missing after 1.5 update installed

This article has been archived and is no longer updated by Apple.

Issue or symptom

Folders or projects may disappear after you update to Aperture 1.5

Solution

The first thing to be sure of when this happens is that you do not empty the Trash until you have performed the following steps, or you may lose images.

Before proceeding with the following steps, check the issue described here. If this does not resolve the issue proceed as follows.

This happens when you use a period (".") as the first character in the folder/project name. The computer treats files or folders that start with a period as hidden files. If this happens, and you have an up-to-date vault, then do the Reinstall and Recover steps. If you don't have a vault or your vault is not up-to-date, then follow the Terminal steps below.

Reinstall and Recover

Note: Make sure that you have your installation discs and serial number handy before starting this.

1. In the Finder, go to `/Library/Receipts` and drag all receipts whose names start with "Aperture" to the Trash.
2. Drag the Aperture application from `/Applications` to the Trash.
3. Locate your Aperture Library (by default located at `~/Pictures`) and rename it something like `Aperture Library.old`.
4. Install a previous version of Aperture.
5. Recover your Aperture library from a vault.
6. Rename the folders and projects so that their names do not start with a period (".").
7. Re-apply the Aperture 1.5 update.

Terminal Steps

If you do not have an up-to date Vault, you may be able to recover some or all of the missing images by doing the following:

Warning: These steps involve entering commands in the Terminal application. Users unfamiliar with Terminal and UNIX-style environments should proceed with caution. The entry of incorrect commands may result in data loss and/or unusable system software.

1. Open the Terminal application from `/Applications/Utlities`.
2. At the prompt, type
   `defaults write com.apple.finder AppleShowAllFiles YES`
3. Log out and then back in. This will cause the changes from the previous step to take effect.
4. Open the Trash. If there are any of your missing folders there, drag them out of the Trash to the Desktop.
5. Rename any items from the previous step whose names start with "."
6. Control-click your Aperture Library and choose **Show Package Contents** from the shortcut menu.
7. If any of the project package or folder names in the library start with ".", rename them.
8. If you used a "." to start any folder names inside projects, then Control-click any of the project packages that contain those folders, choose **Show Package Contents**, and rename the folders.
9. Open Aperture. It will detect the renamed items.
10. If you recovered any items from the Trash, re-import the images from the Desktop.
11. At the prompt in the Terminal application, type
    `defaults write com.apple.finder AppleShowAllFiles NO`
12. Quit Terminal.
13. Log out and then back in. This will cause the changes from the previous step to take effect.

Aperture: Some projects seem to be missing after updating to Aperture 1.5

This article has been archived and is no longer updated by Apple.

Issue or symptom

After you update to Aperture 1.5, the Project Pane may not show all your projects.

Solution

In some cases, the Project Pane settings are changed by updating to Aperture 1.5. To resolve the issue, change the setting in the **Projects** pop-up menu from **Show Favorites** or **Show Recent** to **Show All**.

If the issue continues, see this document.

This document will be updated as more information becomes available.

Aperture: New and updated Automator actions do not behave as expected

This article has been archived and is no longer updated by Apple.

Issue or symptom

This issue may manifest in several ways:

- When you choose the **Import by Reference** option in the **Import Images** Automator action, imported images are placed in the Aperture Library (managed).
- When you use the **Export Images** action, images may be exported using the version name, rather than the file naming preset you selected.
- You choose **Export Images**, but it shows up as **Export Versions** in your workflow.

Solution

These issues can occur when you have updated from Aperture 1.1.2 to 1.5. To resolve the issues, delete the file `~/Library/Caches/com.apple.automator.actioncache`.

This issue is resolved in Aperture 1.5.1.

Published Date: Feb 20, 2012

Mac OS X 10.4.8: Black rectangle may appear after installing Mac OS X 10.4.8 update

This article has been archived and is no longer updated by Apple.

Issue or symptom

After installing the Mac OS X 10.4.8 Update, a black rectangle may appear around the cursor and follow the pointer's movement.

Solution

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Universal Access**.
3. Click the Seeing tab.
4. Click Options.
5. Deselect "Show preview rectangle when zoomed out".
6. Click Done.

Aperture 1.5 may fail to open on some iMac G5 computers

This article has been archived and is no longer updated by Apple.

Issue

Aperture may fail to open on a 1.8 GHz iMac G5 that has an NVIDIA GeForce FX 5200 Ultra graphics card.

Affected Products:

- 1.8 GHz iMac G5 with GeForce FX 5200 Ultra graphics
- Aperture 1.5

Solution

This issue is resolved in Aperture 1.5.1.

DVD Studio Pro: For motion menu background assets, use DV QuickTime sources with High Quality setting

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you use DV video content as a menu background element, the menu may not be rendered with the best possible quality if the High Quality QuickTime option is not set in the asset.

Solution

This issue occurs rarely, and only with DV QuickTime movies. You can avoid this issue by setting the High Quality option for your asset as follows.

Perform the following steps before importing the asset:

1. Open the movie file with QuickTime Player.
2. Choose **Window > Show Movie Properties**.
3. In the Properties window, select the Video Track.
4. Select the Visual Settings button. (If you do not see the Visual Settings button, try selecting the Audio Track, then reselect the VideoTrack to refresh the button display).
5. Select the High Quality check box if it isn't already selected.
6. Save the file.

Note: In QuickTime 7 and later, you can select a preference to always use high-quality video setting when available. If that preference is set, then the High Quality property will be selected by default when you open the file in QuickTime player.

This document will be updated as more information becomes available.

Mac OS X 10.4: Speech Commands window is empty

This article has been archived and is no longer updated by Apple.

Issue or symptom

When using Speakable Items in Mac OS X 10.4, the Speech Commands window may be empty (blank) and Speakable Items may not respond to any spoken commands.

Solution

This can happen if Address Book contains any Company cards that have no name in the Company field.

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Speech**.
3. Click the Speech Recognition tab.
4. Click the Off button next to Speakable Items.
5. Click the Commands tab.
6. Select Address Book from the list of command sets.
7. Click the Configure button.
8. Deselect any entries named "(null)".

9. Click Save when done.
10. Click the On button next to Speakable Items.

Additional information

If you would prefer to make the "(null)" address cards speakable, use these steps instead of the steps above:

1. Open Address Book (/Applications/Address Book).
2. Look at all cards that have been designated as a Company (icon looks like buildings) and make sure each of these cards has a name entered in the Company field, even if there is already a name entered in the First and Last fields.
3. Turn Speakable Items off, then back on.

Note: If you see "(null)" Address Book cards on an Intel-based Mac, and the Speech Commands window is not blank, see this article instead.

For other tips about using spoken commands see this article.

This document will be updated as more information becomes available.

iMovie: Use iMovie HD after migrating to a new computer

This article has been archived and is no longer updated by Apple.

After using Setup Assistant or Migration Assistant to migrate applications from a computer that has iMovie installed (version 4.0.1 or earlier) to a computer that has iMovie HD installed (version 5 or later), the destination computer will have both iMovie and iMovie HD installed. The iMovie icon on the Dock of any migrated users will open the older version of iMovie, which will not have as many features as iMovie HD and may not function properly with other iLife applications. The older version of iMovie can safely be removed from the system and iMovie HD should be used instead.

MacBook Color Profile changes after installing Mac OS X 10.4.8 Update

This article has been archived and is no longer updated by Apple.

Issue or symptom

After installing the Mac OS X 10.4.8 update, some MacBook computers will have a new color profile that is more consistent with other MacBook and MacBook Pro computers but may appear to have a blue tint when compared to the previous profile.

Solution

You can determine which profile you're using by opening the folder /Library/ColorSync/Profiles/Displays/. If you see a file named "Color LCD-4271780.icc" then you have the newer profile. If you don't see a file with this exact name, then the profile you have after installing Mac OS X 10.4.8 is the same one you had prior to installing the Mac OS X v10.4.8 update. (Not all MacBooks will have an updated color profile. If your computer doesn't have an updated profile, this article does not apply to your computer.)

If you don't like the updated profile, you have two choices. You can create a custom profile, or you can return to the previous default profile.

Previous profile

If you prefer to return to the color profile you had before updating, you can download it here. (The profile has been compressed into a .zip file - you may need to unzip the file in order to get the color profile with the .icc suffix.)

To install the profile:

1. Copy the downloaded file, "Color LCD-4271780_1047.icc" into /Library/ColorSync/Profiles/
2. Open the Displays pane of System Preferences and select the Color tab.
3. Select the desired color profile. The profile you used to use, that you just downloaded, is named "Color LCD v10.4.7". The profile that was updated with Mac OS X 10.4.8 is "Color LCD".

If your MacBook did not require the newer profile, then you won't see the "Color LCD v10.4.7" profile in the list even if you add it to your profiles folder. Profiles that were not created on your computer are filtered from the list.

Custom profile

You can also create a custom profile by clicking the Calibrate button in the Color tab of the Displays preference pane. This will open the Display Calibrator Assistant. Using expert mode, you can choose the color temperature you prefer.

Aperture: Tips on Using Edge Sharpen in Aperture 1.5

This article has been archived and is no longer updated by Apple.

Basics

The Edge Sharpen adjustment in Aperture is a professional tool that's used to sharpen photos. Unlike some sharpeners, Edge Sharpen has four special characteristics:

- **Only edges are sharpened**
  Edge Sharpen computes an edge mask and uses it to constrain the results of the sharpening operation. This means that, with the right settings, you should be able to sharpen your image without bringing up the texture in the noise, or in the sky. This can be useful in sharpening the edges of a face without introducing pockmarks.

- **Only image luminance is sharpened**
  Typical sharpeners work in the RGB color space. This can cause unusual colors to appear. So Edge Sharpen performs its sharpening only on the luminance information of the image, leaving the hue and saturation alone.

- **Image luminance is sharpened in a perceptual space**
  Sharpening should be accomplished in a space that has equal steps for equal perceptual steps. The Aperture Edge Sharpen adjustment does this so that the sharpening effect will be approximately the same in shadow areas as it is in the midtones.

- **Three sharpening passes are employed**

  It has often been mentioned on professional photography sites that typical sharpening algorithms can be improved by using several small sharpening steps with lower intensity. Usually the visual improvement is a decrease in the "ringing" around hard edges. These three sharpening passes are accomplished at different pixel radii (you can think of them as 1, 2, and 4 pixels, although their exact radii, actually standard deviations, are slightly different). Also, each sharpening pass uses a lowered intensity to purposefully avoid excessive "ringing" around edges. The relative contributions of each sharpening pass can be controlled using the Falloff slider.

Note: The 1, 2, and 4 scales were chosen specifically because they straddle the typical sharpening radius for a digital camera image (2.2 pixels).

Parameters

You can control Edge Sharpen to get professional results.

Intensity
The Intensity slider controls the overall amount of sharpening applied. Drag the Intensity slider to the right to increase the amount of sharpening applied to the image, and drag the Intensity slider back to the left to reduce it.

Edges
The Edges slider controls which pixels are edges and which are not. Drag the Edges slider to the right to increase the number of pixels that qualify as edges, and drag the Edges slider back to the left to restrict sharpening further. If you see noise increasing in a flat area of the image, like the sky, decrease the Edges parameter value.

Falloff
The Falloff slider controls how much sharpening is applied during the three sharpening passes at 1, 2, and 4 pixels respectively. Usually, the most sharpening happens in the 1-pixel pass, less in the 2-pixel pass, and less still in the 4-pixel pass. Drag the Falloff slider to the right to equalize the amount of sharpening power between the three sharpening radii, and drag the Falloff slider back to the left to increase the total sharpening power proportionately at the smallest features. Typically you should set the falloff parameter to a value between 0.4 and 0.7; a value of 0.7 means that, proportionately, only 70 percent of the sharpening power applied at the 1-pixel scale is applied at the 2-pixel scale, and only 49 percent of the 1-pixel scale sharpening is applied at the 4-pixel scale. Note that total intensity (between the three passes) always adds up to the indicated value of the Intensity slider.

Workflow

To sharpen an image:

1. Set the Intensity slider to the maximum value to see the effect of the operation.
2. Adjust the Edges slider so you can see which parts of the image are being sharpened. If possible, adjust the Edges slider so that edges are sharpened, but noise and texture in the image are not affected.
3. Adjust the Falloff slider so that the edge sizes you want sharpened the most are accentuated.
4. Decrease the Intensity parameter value until the sharpening effect is appropriately subtle. Usually a value of 0.5 is too much.

Edge Sharpen and RAW Edge Sharpening

TA24421_Aperture_Tips_on_Using_Edge_Sharpen_in_Aperture_.pdf

You can control the amount of sharpening applied in the RAW demosaic process as well. It is controlled by the Intensity and Edges sliders in the RAW Fine Tuning adjustment. This sharpening is generally applied to all your RAW files, so you might want to turn it down (or off) and apply sharpening as an adjustment later. If you want sharpening applied automatically as part of your RAW workflow, leave the settings at the default values. They are intended to "undo" the effect of the camera's internal anti-aliasing filter and provide a suitably sharp image right out of RAW conversion.

Nike + iPod Voice Kits: Frequently Asked Questions

This article has been archived and is no longer updated by Apple.

Spoken feedback is available in some languages other than English. If you set your iPod to a language in which spoken feedback is available and connect it to your computer, iTunes prompts you to download a version in the other language. If you set your iPod back to English, you can still hear spoken feedback in English. You can have only one non-English version of spoken feedback on your iPod at a time.

Which languages are available?
English has been available since the Nike + iPod Sport Kit was introduced. Japanese, French, Italian, German, and Spanish were released on 16 Oct 2006.

What is the size of a voice kit?
13 MB - 14 MB, depending on the language

What is hardware is required?

- Nike + iPod Sport Kit
- An iPod nano or iPod nano (Second Generation)
- Nike+ ready shoes

What software is required?

- iTunes 7.0.1 or later (Mac or Windows) with an Internet connection[1]
- iPod nano with iPod nano software 1.3 or later
- iPod nano (Second Generation) with iPod nano Second Generation software 1.1 or later

Where is the voice kit stored once it is downloaded?
Mac `~/Library/iTunes/Nike + iPod Voice Kits/`
Windows: `C:\Documents and Settings\yourusername\Application Data\Apple Computer\iTunes\Nike + iPod Voice Kits`

How do I get a particular voice kit to load onto iPod?

1. Make sure you are using the correct version of iTunes on your computer.
2. Make sure you are using the correct version of iPod software on your iPod nano.
3. If you have never connected the Nike + iPod Sport Kit Receiver to your iPod nano, do so now, wait 10 seconds and then remove the Receiver from the iPod nano.
4. Set the iPod to the desired language (Choose **Settings > Language**).
5. Connect iPod nano to your computer and open iTunes if it does not open automatically.
6. You will be prompted to download the latest voice kit for that language, if available.

How do I know that I have done these steps correctly?
When you connect iPod you will see the following:

or (in Japanese):

When you click "Install", the iTunes LCD will display the download progress as shown:

(in Japanese):

What can I do if I experience a problem with a voice kit and want to reload them?

1. Delete the "Nike + iPod Voice Kits" folder
   Mac:
   `~/Library/iTunes/Nike + iPod Voice Kits`
   Windows:
   `C:\Documents and Settings\yourusername\Application Data\Apple Computer\iTunes\Nike + iPod Voice Kits`
2. Restore iPod nano with latest software
3. Pick the language on iPod .
4. Connect and disconnect Nike + iPod Sport Kit receiver.
5. Connect iPod nano to your computer and make sure iTunes opens.
6. Follow the prompts to download the voice kits for that language, if available.

Notes

1. You must be connected to the Internet to get the voice kits.

GarageBand: Imported movie does not play to end

This article has been archived and is no longer updated by Apple.

Issue or symptom

A movie you import into GarageBand may not play all the way to the end.

Solution

If the movie is longer than the maximum GarageBand song length of 1999 bars, then the movie will stop playing when that point is reached. Lower the tempo of the song so the entire movie fits within 1999 bars.

Published Date: Feb 20, 2012

Aperture: Previews are recreated after turning off generation in preferences

This article has been archived and is no longer updated by Apple.

Issue or symptom

You delete the previews in your library, or for a project, and disable "New projects automatically generate previews" in the Aperture preferences. The next time you open Aperture, the previews are recreated.

Solution

The preference *New projects automatically generate previews* only governs how new projects are handled. To prevent preview generation for projects that had previously had them, select the project in the Project Pane, click the Action menu (gear icon) in the upper right corner and disable *Maintain Previews for Project*. To prevent preview generation for all projects, highlight the Library in the Project Pane, click the gear icon and disable *Maintain Previews for all Projects*.

Aperture: Changes in Aperture 1.5.1

This article has been archived and is no longer updated by Apple.

Changes in Aperture 1.5.1

Aperture 1.5.1 addresses more than 100 issues related to overall reliability and performance in all areas of the application. Here is a partial summary of the specific issues that have been addressed in this release:

Keywords

- Fixed some issues that prevented keywords from being properly added to or deleted from the Keyword HUD.
- Sorting of keywords in the Keyword HUD is now case-insensitive.
- Improved reliability when importing keyword list from a text file.
- Shift–clicking the Keyword button now correctly removes the corresponding keyword from the selected image(s).
- Multiple keywords applied to a single image and exported using XMP sidecar files now appear as separate keywords when viewed in applications such as Extensis Portfolio.

Loupe

- The most recent setting for the size of the Loupe is now retained for subsequent work sessions.
- Contextual menu commands for Loupe are now accessible via the the contextual menu on the Light Table.
- Improved reliability when using the Loupe while making adjustments in book and web gallery views.

Cropping

- Crop aspect ratio is now properly retained after deselecting a cropped image.
- Crop tool no longer reverts to the "1:1" setting when returning to a cropped image.

Previews

- Improved responsiveness when making Adjustments when the "Maintain Previews for Project" option is activated.
- Improved responsiveness while Previews are being generated.
- Previews for versions are all now correctly deleted when versions are deleted.
- Duplicating an adjusted version automatically generates an up-to-date preview.
- New previews are now automatically generated for duplicate versions.

Metadata presets

- Addressed issue with metadata presets in Import and Batch Change that prevented users from updating fields.

File renaming

- File naming changes applied during a relocate or consolidate operation are now properly updated in the database.

iPhoto Library import

- Improved reliability when importing an entire iPhoto Library or selected albums into Aperture.

Watermarks

- Watermarks now scale properly when applied on export.

Consolidate/Relocate

- Improved reliability when relocating the contents of an entire Library.
- Dialog now warns that consolidating images may revert files to their original names.
- Exporting or relocating a selected group of images while renaming them with a format that uses a counter or sequence now correctly preserves the order of images.

Managing Referenced Files

- Improved reliability when using Manage Referenced Files to reconnect to master images.

- Improved reliability when reconnecting to images that have been moved to a DVD/CD.
- The Mount/Unmount button in Manage Referenced Files dialog now properly updates Volume status.

Lift & Stamp

- Resolved a database issue that occurred when using Lift and Stamp with the *Create new versions when making adjustments* preference turned on.
- Keywords that are "lifted" and then deleted from the Lift & Stamp HUD are now omitted when stamped.

Print dialog

- Image preview resizes correctly when the Print dialog is resized.
- Changes to Colorsync profile and gamma settings in the Print dialog are now correctly reflected in the image preview in the Print dialog.

AppleScript and Automator

- Fixed an issue that occurred when exporting Versions with Current Version Name using Automator.
- The Extract Metadata Action now properly exports the selected metadata when used in an Automator workflow.

Image Deletion

- Fixed an issue that could occur when deleting duplicate versions in List View.
- The Delete Project dialog box now displays the name of the project being deleted.
- Fixed an issue which could cause performance to degrade after deleting Externally Edited images.
- Aperture's database now properly reflects the deletion of referenced images that are stored on a network volume.

Miscellaneous issues addressed

- Improved reliability when exporting Projects.
- Aperture now properly validates and runs on 1.8 GHz iMac with NVIDIA GeForce FX 5200 graphics card.
- Improved performance when switching in and out of Full Screen mode.
- Aperture no longer allows users to create folders with a period (.) as the first character.
- Pressing Option–Zero now clears rating from Compare image.
- Fixed an issue that prevented images with a "@" in the filename to be properly copied to a Vault.
- Fixed an issue with Autostacking offline images when in List View.
- Captions for books that were created using previous versions of Aperture are now correctly linked.

Final Cut Pro will not open in Curtain Mode under Apple Remote Desktop

This article has been archived and is no longer updated by Apple.

Issue

Apple Remote Desktop 3 includes a new feature called **Curtain Mode**. This feature enables a Remote Desktop administrator to temporarily disable the display on a Remote Desktop client machine while it is being controlled, effectively hiding the screen contents behind a "curtain." Final Cut Pro 5.1.2 cannot be opened on a Remote Desktop client while Curtain Mode is active.

Affected Products:

- Final Cut Pro
- Apple Remote Desktop Client

Solution

To work around this issue, open Final Cut Pro before activating Curtain Mode.

Note: Using Final Cut Pro remotely via Apple Remote Desktop is possible, but somewhat unconventional. Usually, an editor will sit at the computer for more responsive interactivity while editing in Final Cut Pro.

This document will be updated as more information becomes available.

Related Terms: can not cannot

Published Date: Feb 20, 2012

Final Cut Pro 5: May drop frames of 1080pA24 media on 1.67GHz PowerBook G4 models

This article has been archived and is no longer updated by Apple.

Issue

While the PowerBook models that operate at 1.67GHz are qualified to run Final Cut Pro 5, testing has shown that there may be dropped frames if you are working with DVCPRO HD 1080pA24 media.

Because the 1080pA24 media on tape is actually recorded at 29.97 interlaced frames per second (fps), Final Cut Pro has to remove the redundant fields, resulting in a 23.98 fps movie on your scratch disk. Performing the on-the-fly removal of redundant frames is a very performance-intensive operation, and the 1.67 GHz PowerBook G4 models may drop frames when attempting to Print to Video in the 1080pA24 format.

Affected Products

- Final Cut Pro 5
- PowerBook G4 (15-inch 1.67 GHz)
- PowerBook G4 (17-inch 1.67 GHz)

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Aperture: "Insufficient Disk Space" error when importing images

This article has been archived and is no longer updated by Apple.

Issue or symptom

Sometimes when you try to import images into Aperture, an error dialog indicating that more disk space is needed occurs, although there is more than the indicated amount of space available.

Solution

Aperture requires that a certain amount of unused disk space be kept in reserve. You may find situations where this dialog comes up when there are several hundred megabytes free, even after accounting for the space required for the images you wish to import. It's good practice to keep at least 1 GB free on the volume where the Aperture library is stored.

About Apple Remote Desktop 3.1

This article has been archived and is no longer updated by Apple.

Apple Remote Desktop (ARD) version 3.1 can be installed on computers that have:

- Mac OS X 10.3.9 or later.
- An Ethernet (recommended), Airport, or FireWire over IP network connection
- Apple Remote Desktop (ARD) 3.0

Apple Remote Desktop 3.1 is a Universal Binary updater application and will upgrade Apple Remote Desktop 3.0 installations on Intel- or PowerPC-based Macintosh computers which meet the above criteria.

Update packages

Apple Remote Desktop 3.1 provides two update packages:

- Apple Remote Desktop 3.1 Client
- Apple Remote Desktop 3.1 Admin

These updates can be downloaded from Apple downloads.

Compatibility with previous versions of Apple Remote Desktop

Apple Remote Desktop 3.1 allows you to Control or Observe Apple Remote Desktop version 2.0 or later and 3.0 clients.

If you choose not to upgrade your clients to the current version, you will have limited backwards compatibility and will only be able to control/observe computers that are running version 2.x or later of the client software.

Improvements

Apple Remote Desktop 3.1 offers numerous improvements, including:

Software distribution

- Install Package task now supports installing Apple Installer packages that have packages outside the .mpkg
- Addresses issues when copying files to root ("/") on PowerPC clients
- Copy Items task now correctly supports copying of files with aliases

Asset management

- PCI Reports now called Expansion Card Reports
- Software reports now also report architecture type of applications
- System Information Report can now report on Lights Out Management configuration and settings
- Administration Settings Report can now report on Lights Out Management settings
- Application Usage Reports no longer allows for a start date to be later than the end date
- You can now drag computer lists and computers into the the Remote Spotlight Search window

Remote control

- You can now power on an Xserve with Lights Out Management
- Send UNIX panel now correctly focuses cursor in the script field
- Enter key now invokes the Send button in Send UNIX panel
- The Lock Screen and Curtain Mode tasks can now display custom lock screen images
- Send UNIX task no longer has limits on length of commands/scripts being sent to client computers

Remote assistance

- Improved support for using right mouse buttons to invoke contextual menus
- When performing a drag-and-drop copy, Apple Remote Desktop will now prompt you if a same-named item already exists in the location
- Improved compatibility with third-party VNC viewers and servers
- Addresses an issue that could cause video to be displayed improperly when sharing screens
- Control/observe toolbars now retain their settings correctly

Automation

- Copy Items action now also works with computer lists

- AppleScript dictionary now includes support for Power On task for Xserves with Lights Out Management
- Workflows that include Choose Remote Computer and Choose Computer List actions now properly retain their settings when they are re-opened
- Using the "copy to me" task in AppleScript no longer cause the application to unexpectedly quit
- Execute AppleScript action now correctly handles quotes in the input
- AppleScript no longer sends extra quotes in the results of a Send UNIX task
- AppleScript now correctly interprets Install Package tasks that use a Task Server

Other

- Network scanners now support Bonjour-only discovery of Apple Remote Desktop and VNC-enabled client computers
- Get Info panel now supports setting username and password for the Xserves Lights Out Management
- Computer lists can now display the Lights Out Management status of Xserves
- Addresses issue of Smart Computer Lists occasionally clearing out entries in other computer lists
- Apple Remote Desktop now correctly recognizes users that login using Active Directory account with machine administration rights
- kickstart can now correctly configure clients for VNC access
- Resolves an issue when the client idle time in computer lists reported thousands of hours
- Computers that have multiple network interfaces can now be used as Task Servers
- Addresses issues in which IP addresses could occasionally be displayed inverted
- Resolves the issue of not being able to include individual icons for the Sleep/Wake/Restart/Shutdown on your toolbar
- Addresses an issue with computers disappearing form smart computer lists after quitting the Apple Remote Desktop application
- If System Preferences has been restricted from opening, the Remote Desktop menu extra will now not allow launching of System Preferences
- Addressees an issue in which task items could occasionally be dimmed ("grayed out")
- Support for administrators that are in more than 14 groups
- The Installed RAM column of computer lists no longer rounds up values
- Authenticating using directory services based accounts no longer conflicts with mobile accounts in Active Directory
- Authenticating using directory services can now be throttled to minimize load on directory servers

For more support information, visit the Apple Remote Desktop support page.

Final Cut Pro: Canceling render may take longer when rendering media with processor-intensive effects

This article has been archived and is no longer updated by Apple.

When Final Cut Pro is rendering media, you can cancel the render at any point in its progress by clicking the Cancel button. If the cancel button seems unresponsive for a moment after you click it, don't worry; the render operation will stop momentarily.

This can occur in some cases when Final Cut Pro is rendering media that requires a lot of processing power (i.e., clips that have a lot of effects or superimposed elements). In such a case, it's only necessary to click the Cancel button once, and Final Cut Pro will cease rendering.

This document will be updated as more information becomes available.

MacBook Pro: What to do if bus-powered FireWire devices don‘t appear in menus or behave correctly

This article has been archived and is no longer updated by Apple.

Your MacBook Pro may not recognize your FireWire device properly—it doesn't appear in menus, it's not recognized or it doesn't behave properly.

If you find this to be the case, the device probably came with an external power supply, and is demanding more power than the FireWire standard provides through the bus. This issue can also appear if a number of FireWire devices are plugged in to the same bus and demand more power than the bus provides.

(Bus-powered devices derive their power from a source on the bus to which they are attached. Self-powered devices come with an AC adapter and plug into a wall socket for power as well as into the computer.)

Be sure always to use the power supply if one came with a FireWire product. If you are connecting more than one device, use a self-powered FireWire hub or switch.

iPhoto: iPhoto unexpectedly quits when importing movies

This article has been archived and is no longer updated by Apple.

Issue or symptom

When importing small movie files (such as .avi files) from a still camera or other device, iPhoto may unexpectedly quit.

Solution

1. Check the following locations for non-Apple plug-ins:
   - ~/Library/QuickTime/ (that is, the QuickTime folder inside the Library folder in your home directory)
   - /Library/QuickTime/ (that is, the QuickTime folder inside the Library folder at the root level of your computer)
2. Remove the non-Apple plug-ins you find in those locations.
3. Log out and log back in and see if iPhoto now imports the movie files correctly. If so, contact the developer of the plug-in you removed for more information, or to see if an update to the plug-in is available.

Mac OS X Server 10.4: Serial number "invalid" alert after enabling firewall service on an Intel-based Mac

This article has been archived and is no longer updated by Apple.

Issue or symptom

After enabling Mac OS X Server 10.4's firewall service on an Intel-based Mac, you may see an alert message stating that the serial number is "invalid."

Solution

Update to Mac OS X Server 10.4.9 or later.

.Mac Webmail: Ways to use Address Book entries to create new messages

This article has been archived and is no longer updated by Apple.

If you want to email a contact in your .Mac Webmail Address Book, there are two ways to go about this:

1. Start typing the contact's name—the autocompletion feature should fill in the information.
2. Find the contact in the Address Book in the left pane, and then click on the email address to create a new message.

Note: Don't use method 2 (click on the Address Book email address) if you're already composing a new message. If you're already composing a new message and you click an email address in your address book, you'll see an alert message that says "This message has not been sent. To close this message without sending it, click OK."

Published Date: Oct 7, 2016

Don‘t leave .Mac Webmail while composing an email

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you create a new email in the three-pane layout of .Mac webmail, a separate window pops up for your email composition. Make sure you don't navigate to another site from the main .Mac webmail page while you're writing your email. If you navigate outside of webmail with that window, your message will appear to send but will not actually be sent.

Affected Product

- .Mac webmail

Solution

Be sure to complete your email message and click send while the mac.com site is still in the main window. If you need to view a different webpage while composing your email, open a new window for the different webpage.

Final Cut Express may unexpectedly quit if the display color setting is changed to thousands

This article has been archived and is no longer updated by Apple.

Final Cut Express HD is capable of handling millions of different colors—all of the colors in the video gamut and beyond. For editors to work with all these colors effectively, Final Cut Express HD is designed to be run while your computer's display is set to show millions of colors, as opposed to thousands or fewer.

For best results, be sure that your display is set to show millions of colors before you open Final Cut Express HD. If you change the color setting for your display from millions of colors to thousands while Final Cut Express is running, you may encounter unexpected results or Final Cut Express HD may unexpectedly quit.

Checking your display color settings

Follow these steps to check the color setting for your display.

1. Choose **Apple** > **System Preferences**.
2. Choose **View** > **Displays** to open display preferences.
3. From the **Colors** pop-up menu, choose **Millions**.

If you have more than one display connected, there will be a separate settings panel for each display. Verify that each is set to Millions of colors.

.Mac: System Status Says some members may experience intermittent mail delivery errors

This article has been archived and is no longer updated by Apple.

Sometimes the .Mac Support site shows a System Status announcement that says "Some members may be experiencing intermittent delivery errors when trying to send mail from their mail clients. .Mac mail on the web and all other .Mac services are unaffected. Read more for interim solutions." This article explains that message in more detail.

What can I expect while this is happening?

You may experience intermittent difficulties sending mail from your .mac address using your computer's mail application.

What can I do while this is happening?

You will be able to send mail intermittently. If you experience difficulties sending .Mac mail using a mail application on your computer, try sending your mail from .Mac Mail on the web. To access .Mac Mail on the web, go to http://www.mac.com/ and click the Mail link at the top left of the menu bar.

If you need to interact with a .Mac Support specialist, go to the .Mac Support Page at http://www.apple.com/support/dotmac/. Select the appropriate topic, fill out the form at the bottom of the page, and click "Send Question." Our support experts will make every effort to reply within 24 hours.

What can I expect after this is resolved?

When the issue is resolved, you will be able to send and retrieve .Mac mail from your computer's mail application as usual.

Mac OS 8: Items Cannot Be Left In Trash Message

When I place an item in the Trash, a message appears stating that the item cannot be left in the Trash and needs to be deleted immediately.

This article has been archived and is no longer updated by Apple.
If your date gets reset to an invalid year such as 1904, this may occur under Mac OS 8.0 or Mac OS 8.1. This is more common on PowerBook models, where if the unit is left without power for a lengthy period of time the backup battery can drain causing PRAM to get reset along with the date and time.

To resolve this, open the Date & Time control panel and set the correct date.

Apple Portables running Mac OS X 10.4.8 or later: How to use trackpad screen zooming

This article has been archived and is no longer updated by Apple.

On Apple portables that include trackpad scrolling and are running Mac OS X 10.4.8, you can use the trackpad in addition to keyboard commands, to control screen zooming.

To zoom the image on the screen using the trackpad, hold down a modifier key and gesture with a forward finger motion on the trackpad. The reverse motion will zoom back out. (By default, the modifier key is the Control key—but this can be customized in the Keyboard & Mouse pane of System Preferences.)

Screen zooming is already set up on your Apple portable running Mac OS X 10.4.8 or later. It may even already be enabled. To personalize screen zooming:

1. Open the Keyboard & Mouse pane of System Preferences.
2. Select the Trackpad tab.
3. Select or deselect “Zoom while holding” and enter a modifier key or keys to turn zooming on or off. (To use multiple modifier keys, press them at the same time.)

There are four user-configurable options that adjust how you can move within a zoomed screen and how smooth the image will look:

- Select "Continuously with the pointer" to make the zoomed image shift continuously as you move the mouse.
- Select "Only when the pointer reaches an edge" to prevent the zoomed image from moving until you move the pointer to one edge of the screen.
- Select "So the pointer is at or near the center of the image" to keep the center point of the screen near the pointer as you move it.
- Select "Smooth images" to make the zoomed screen images appear smooth when you press Option-Command.

QuickTime MPEG-2 Playback Component plays only first 4 GB of file

This article has been archived and is no longer updated by Apple.

The QuickTime MPEG-2 Playback Component provides QuickTime users with the ability to import and play back MPEG-2 content, including both multiplexed (a.k.a. muxed, where the audio and video tracks are interleaved together into one track) and non-multiplexed (a.k.a. elementary) streams.

The QuickTime MPEG-2 Playback Component will only play the first 4 GB of an MPEG-2 file. QuickTime will open files that are larger, but only the first 4 GB of a given movie will be played.

This document will be updated as more information becomes available.

Aperture: Switching between Aperture Libraries

This article has been archived and is no longer updated by Apple.

In Aperture, you can change the active library you are using for importing and editing pictures. Changing this library will change which photos are displayed in the Photos pane of iMovie, iDVD, and the Desktop Pictures and Screen Saver system preference panes.

To access a different Aperture Library:

1. Choose **Aperture > Preferences**, or press Command–comma (,).
2. Click Choose under the Library Location option.
3. Navigate to and select the Library you want, then click Select.
4. Quit Aperture and then reopen it.

If you don't already have an additional Aperture Library and want to create one, navigate to the folder where you want to create the library at step 3, and then click Select.

By default, Aperture creates a new Library file named Aperture Library. It’s recommended that you rename Library files to avoid any mix-ups or the possibility of overwriting one Library file with another accidentally. After renaming a Library file, make sure to open Aperture and select the renamed Library file.

When you have multiple Library files and you want to switch between them, you use the Preferences window in Aperture to select the Library you want. You then quit and reopen the application to complete the switch.

Additional information is available in the "Working with Library Files" section of the Aperture User's Guide.

How Final Cut Pro calculates Broadcast Wave File Time at a Video Rate of 29.97 frames per second

This article has been archived and is no longer updated by Apple.

If you import the same Broadcast Wave file (BWF) into Final Cut Pro and other editing applications, certain timecode numbers may be calculated differently. The following section explains how Final Cut Pro accurately calculates time when importing Broadcast Wave files.

In Final Cut Pro, there are three factors that affect the calculated timecode value of an imported Broadcast Wave file:

1. **The true frame rate of NTSC video:**

   Timecode calculation is fairly straightforward, with the exception of NTSC-related frame rates. Calculating timecode for NTSC video is complicated because it's true frame rate is not simply 30, nor is it 29.97. The actual frame rate is 30 * 1000/1001, which equals 29.9700299700299700 (repeating). Timecode calculated using 29.97 (instead of 30 * 1000/1001) can be inaccurate, especially as the duration of media increases. Final Cut Pro uses the more accurate calculation (30 * 1000/1001).

   For more information, see SMPTE 170M-1999 "Composite Analog Video Signal - NTSC for Studio Applications."

2. **Mapping audio samples to video frames:**

   Timecode is calculated for digital audio files by mapping a certain number of audio samples to each video frame. When the sample rate is an integer multiple of the video frame rate, the timecode count can be accurately mapped to the sample count. For example, if the audio sample rate is 48000 Hz and the video rate is 25 fps, every 1920 audio samples is equivalent to one video frame.

   However, with NTSC-related video rates, there is no simple relationship between the number of audio samples per second and video frames per second. To avoid ambiguity, the Society of Motion Pictures and Television Engineers (SMPTE) specifies how many audio samples should be mapped to each video frame. The number of audio samples per frame is varied on a frame-by-frame basis to form a consistent pattern. Instead of an exact number of samples per frame, a consistent pattern of varying samples is spread over several frames.

   When you import a Broadcast Wave file, Final Cut Pro calculates timecode based on two parameters:

   - The time base (frame rate) of the currently selected sequence preset
   - The audio sample rate of the imported Broadcast Wave file

   When the sequence preset frame rate is 29.97 fps and the sample rate of the Broadcast Wave file is defined in the SMPTE specification, Final Cut Pro uses the repeating frame patterned defined in the SMPTE specification.

   For more information, see sections 3.15 and 14.3 of ANSI/SMPTE 272M-1994 "Formatting AES/EBU Audio and Auxiliary Data into Digital Video Ancillary Data Space."

3. **Dropframe indicators in Broadcast Wave files:**
   There is no ratified standard to indicate or detect whether a Broadcast Wave file was recorded with drop frame or non-drop frame timecode. Although there are several de facto ways this information is stored, Final Cut Pro 5.1.2 does not support reading this information. Instead, Final Cut Pro 5.1.2 always calculates non-drop frame timecode for Broadcast Wave files.

To modify the timecode of a Broadcast WAVE file to drop frame:

1. In the Browser, select the audio clip whose timecode you want to modify.
2. Choose **Modify > Timecode**, then choose Drop Frame from the **Format** pop-up menu.

Detailed SMPTE technical documents and specifications, including those referenced in this document, are available from the SMPTE website.

Remote Desktop: Understanding privileges and security

This article has been archived and is no longer updated by Apple.

Remote Desktop in Sharing preferences

It is not necessary to use an administrative user when assigning privileges in the Remote Desktop pane of Sharing preferences. For improved security, you should use a non-administrative user to restrict access privileges.

If multiple users will be administering a computer with different needs, create separate user accounts on the computer and assign privileges accordingly.

For information on the privileges in Sharing preferences, refer to page 60 in the ARD 3 Admin Guide or pages 38 and 39 in the ARD 2.2 Admin Guide.

Non-administrative users using the admin application ("user mode")

Restrictions for non-admin users are defined in the Security section of Remote Desktop administrators's preferences window. Only administrators may change these settings. For information on user mode settings, refer to page 66 in the ARD 3 Admin Guide or page 51 in the ARD 2.2 Admin Guide.

These settings are designed to prevent non-administrative users from using certain features within the admin application. If you have a user who needs limited access to features, in addition to specifying user mode restrictions, you should create a new user account on the client computer and define privileges accordingly.

For example, if Rita needs to be able to install packages onto clients and obtain reports, create a new user account on the client systems and then assign her the appropriate privileges in the Remote Desktop pane of Sharing preferences, as described above.

Mac OS X Server 10.4.8: Password Server may not start

This article has been archived and is no longer updated by Apple.

Issue or symptom

After updating from Mac OS X Server 10.4.7 to 10.4.8, Password Server may not start. Server Admin may report that the Password Service has stopped.

The ApplePasswordServer.Error.log (in /Library/Logs/PasswordService/) may contain the message, "CUDPListener: internal error, RSA key hash not set."

Solution

The following steps will rebuild your /var/db/authserver/authserverreplicas file.

1. Using these guidelines, create a new file on your desktop named "make-replica-file".

2. Paste this content into the file:

```
#!/bin/sh

if [ `id -u` != 0 ] ; then
  echo "You must run this script as root."
  exit
  elif [ ! -s "/usr/sbin/mkpassdb" ] ; then
  echo "This script can only be run on Mac OS X Server"
  exit
  fi

# try the LDAP config record
  export LDAPConfigRecord=`dscl /LDAPv3/127.0.0.1 -read /Config/passwordserver PasswordServerList | sed 's/PasswordServerList: //'`
  echo $LDAPConfigRecord | grep "No such key" > /tmp/authserverreplicas.test
  if [ ! -s /tmp/authserverreplicas.test ] ; then
  echo "$LDAPConfigRecord"
  exit
  fi

# make the ID string
  export key=`mkpassdb -key`
  export keyID=`echo -n "$key" | md5 | awk '{print toupper($0)}'`

# Get the IPv4 for en0 and look it up
  export QueriedIPAddress=`ifconfig | grep -A 1 "en0" | grep "inet " | sed 's/.*inet //;s/ .*//'`
  export QueriedDNS=`dig -x $QueriedIPAddress | grep -A 1 "ANSWER SECTION" | sed 's/;;.*//;s/.*PTR//' | tr "\\n\\t" "  " | sed 's/ //g' | awk '{print substr($0,0,length($0)-1)}'

echo "<?xml version=\\"1.0\\" encoding=\\"UTF-8\\"?>"
  echo "<!DOCTYPE plist PUBLIC \\"-//Apple Computer//DTD PLIST 1.0//EN\\" \\"http://www.apple.com/DTDs/PropertyList-1.0.dtd\\">"
  echo "<plist version=\\"1.0\\">"
  echo "<dict>"
  echo "        <key>ID</key>"
  echo "        <string>$keyID</string>"
  echo "        <key>Parent</key>"
  echo "        <dict>"
  echo "                <key>DNS</key>"
  echo "                <string>$QueriedDNS</string>"
  echo "                <key>IDRangeBegin</key>"
  echo "                <string>0x00000000000000000000000000000001</string>"
  echo "                <key>IDRangeEnd</key>"
  echo "                <string>0x000000000000000000000000000001f5</string>"
  echo "                <key>IP</key>"
  echo "                <string>$QueriedIPAddress</string>"
  echo "        </dict>"
  echo "        <key>Status</key>"
  echo "        <string>AllowReplication</string>"
  echo "</dict>"
  echo "</plist>"
```

3. In Terminal, execute these commands:

```
$ chmod +x ~/Desktop/make-replica-file
$ sudo ~/Desktop/make-replica-file > ~/Desktop/authserverreplicas
$ chmod 644 ~/Desktop/authserverreplicas
$ sudo chown root:wheel ~/Desktop/authserverreplicas
$ sudo mv ~/Desktop/authserverreplicas /var/db/authserver
```

4. Restart the server.

Final Cut Pro: Multiclips may lose sync if "Remove Subclip Limits" is used

This article has been archived and is no longer updated by Apple.

Issue

If you have a multiclip that has unexpectedly lost sync between its constituent clips, check to see if any of those clips are subclips.

It's perfectly fine to create multiclips comprised of subclips, but there's an important caveat to keep in mind:

- Avoid using the **Remove Subclip Limits** command on any subclips which are included as parts of multiclips. If you do so, the timing of that subclip within the multiclip may fall out of sync with the other parts of the multiclip.

This document will be updated as more information becomes available.

Using systemsetup on Xserve (Intel Xeon) with Apple Remote Desktop 2.x

This article has been archived and is no longer updated by Apple.

Issue or symptom

The systemsetup tool embedded in the ARDAgent.app does not work correctly on Xserve (Intel Xeon) systems when executed with the argument:
`-setwaitforstartupafterpowerfailure`

Solution

There are two different versions of the systemsetup tool in the Mac OS X Server build installed on Xserve (Intel Xeon). One resides in `/usr/sbin` and the other is embedded in ARDAgent.app.

The version of systemsetup tool in `/usr/sbin` in Mac OS X Server on Xserve (Intel Xeon) systems has been updated to function properly when executed with the argument `-setwaitforstartupafterpowerfailure`.

When using this command remotely (within Apple Remote Desktop's *Send UNIX Command* feature) the full path of `/usr/sbin/systemsetup` should be specified rather than simply referencing the tool. If the specific path is not stated, Apple Remote Desktop defaults to using the internal and outdated version.

Published Date: Oct 7, 2016

About the security content of Xcode Tools 2.4.1

This article has been archived and is no longer updated by Apple.

This document describes the security content of Xcode Tools 2.4.1, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Xcode Tools 2.4.1

- **GDB**

  CVE-ID: CVE-2006-4146

  Available for: Mac OS X v10.4 and later

  Impact: Opening a maliciously-crafted DWARF binary with GDB may lead to arbitrary code execution

  Description: GDB, the GNU Debugger, is susceptible to multiple vulnerabilities that may lead to arbitrary code execution when loading maliciously-crafted DWARF binaries. This update addresses the issues by performing additional validation while handling DWARF binaries. Credit to Will Drewry and Tavis Ormandy of the Google Security Team for reporting this issue.

.Mac Webmail: After renaming a contact, the contact may not be searchable

This article has been archived and is no longer updated by Apple.

Symptom or Issue

If you rename a contact using "quick contact"—by changing the name in the First and Last Name fields, you may not be able to filter your messages by that changed name using the Webmail Search field.

The Webmail Search field searches through your message headers. Often when you receive a message in your inbox, it arrives with a first and last name already associated with it. The Webmail Search field looks for precisely that original first and last name. The Webmail Search field also looks for the email address. It doesn't look for the "quick contact" information you have entered.

Solution

There are two ways to deal with this:

- Enter email address in Webmail Search field
  You can retrieve all messages sent from a particular email address if you enter that email address in the Webmail Search field. The Search field will often find the messages even when you've only typed the beginning of the address.
- Sort by "From:"
  If you want to search for email messages from a contact whose name you have changed in your .Mac Address Book, you can sort your webmail by sender by clicking on the "From" category at the top of the sender column. Then your messages will all be ordered by who sent you the message, and all mail from that contact will be grouped together.

iPod 101: Tour the Store

This article has been archived and is no longer updated by Apple.

Now that you've got access to everything that the iTunes Store has to offer, let's go shopping! If you like the feeling of being a kid in a candy store, feel free to roam the virtual aisles without our guidance. Or settle in here to get an overview of the stores within the store and how to navigate through everything.

- Getting Around—The Navigation Bar
- The Homepage
  - Spotlight Items—The latest and greatest
  - Left Column Items—Find music, videos, and podcasts, redeem cards, and more
  - Middle Section Content—New releases, staff favorites, and more
  - Right Column Items—Top songs, albums, and videos

Getting Around—The Navigation Bar

If you're not already in the iTunes Store, go there now (just click iTunes Store in the iTunes Source list). Notice the navigation bar above the iTunes Store page, right below the iTunes display? No matter where you are in the store, you can click the back and forward arrow buttons, the home tab (the button with the house), and any tabs that mark the path you've traveled to jump back and forth to previous locations, like you do with your web browser. Any time you want to go back to the iTunes Store homepage, just click the home tab.

Use the navigation buttons and tabs at the top of the pane to get around the iTunes Store.

The Homepage

Want a little tour before you explore? Read on to discover the iTunes Store sections and special features.

The iTunes Store homepage gives you quick access to the various sections in the store and features some highlights and exclusives that you won't want to miss. The homepage layout is used in other areas of the iTunes Store too. If you click Audiobooks in the left column, you'll be taken to the audiobooks store page, which looks just like the homepage except that you'll see audiobook images and content instead of albums. Likewise, if you choose any media category in the top left column, you'll get a page that has the same look and feel except it's geared toward your chosen media preference. Here's a look at the sections you'll find on most store pages.

Spotlight Items

Check out the three top panes to see the latest releases and exclusives.

At the top of the page, you'll see three rotating panels that change over time. This is where we highlight new items, exclusive content, and other things that are sure to spark interest. To get more details, just click the item to go to its page.

Left Column Items

Starting from the Top

If you have a favorite media, and don't want to be bothered with all the rest, just click any of the iTunes Store pane categories, and bam, you've got everything you ever wanted in that category laid out before your eyes. Choose from Music, Movies, TV Shows[1], Music Videos, Audiobooks,

Podcasts, or even iPod Games. One click and you're in heaven.

View Videos
iTunes isn't just about music—you can watch videos right in your iTunes window too. And if you have a Fifth Generation iPod (with video), you can transfer videos from your iTunes library to your iPod. If you need a little visual stimulation, check out the music videos, TV shows, and in the U.S. movies and movie trailers available in the iTunes Store.

Find What you want Fast in the iTunes Store Pane
If you came shopping with a specific media in mind—you just have to find out what happened on that episode of LOST you missed—click TV Shows in the iTunes Store pane to go to the TV Shows page, or click Movies or Music Videos for similar pages. The new page will share the same layout but the middle section will break-out the media into easy-to-browse categories that make your shopping target a cinch to find!

If you're looking for podcasts or audiobooks, click the Podcasts or Audiobooks link to visit those stores. If you want to learn more about finding and subscribing to podcasts, see "Plug into Podcasts." We'll talk more about how to find and purchase audiobooks (as well as music) in "Browse and Buy Books and Music."

Just Looking- For Video Suggestions?
If you're in the mood for video—but aren't sure quite what—check out the Top Movies, Top TV Episodes, or Top Music Videos panes. Each pane is a top-10 best-sellers list. Click the pane title to go to the store for that media, or click any top-10 title to go to a page for all the video buzz. You can check out the credits, the plot, customer reviews, or see the trailer. Click the Add Movie button to add the video to your shopping cart, or the Pre-order button to get a bargain on pre-release titles.

Middle Section Content

Find what's new
In the middle part of the homepage, you'll find some scrollable panes and additional featured items. Here's a look at what you'll generally find in this section.

Scrollable panes
The middle section contains several scrollable panes that let you scroll through a row of corresponding selections and click what you like to go to that selection's page. Some of the panes also have tabs just under the title bar. The tabs let you zero-in on whatever media type you want in that pane topic. Click Alternative, under New Releases, to skip the top-of-the-pop stuff.

The Lastest and Greatest
The New Releases pane contains (no surprise) new media additions. Click the pane's right or left arrow to scroll the album content forward or backward, or click See All to (you guessed it) see all new releases. New Releases displays all new additions by week (we add stuff every Tuesday, so make it a point to swing by the store).

The What's Hot pane keeps you up to date with what's currently toping the charts. Chances are, if you've heard somebody talking about new music or video, it's listed here. Click the tabs, or See All, to get a broader look at What's Hot.

Recommendations—From the Staff
The iTunes store staff keeps up with it all. They not only know what's hot now, but what was hot in the past, and what will be hot tomorrow. Check out the selections in Staff Favorites if you're in the mood to expand your collections, or branch out into new areas.

Get exclusive stuff
The **EXCLUSIVELY ON iTunes** section features exclusive albums by artists that offer special in-studio live performances, choose album tracks, and interviews with the artist about their careers and music. Select an artist in the list to view the album's contents or click See All (or the iTunes Originals header) to view all iTunes Originals albums. To preview any song on any iTunes Originals album, just choose a song in the preview pane and double-click it.

The Exclusives section showcases albums and songs that are iTunes exclusives, meaning you won't find these items anywhere else at that particular time, or prereleases (albums or songs that you can buy right now before the album gets released worldwide). As with the New Releases section, you can use the pane's arrows to scroll through content or click See All to view everything. If you're curious to see what some iTunes Store staffers listen to, check out the Staff Favorites section, while the Just Added section features albums that are new to the iTunes Store.

Get freebies
Who said that nothing in life is free? Check out the songs (and even audiobooks from time to time) in the **FREE ON iTunes** section for free song downloads (in addition to our free single of the week).

Other items change constantly, depending on what promotions we're running. For example, you may find links to various win-a-free-song redemptions, album pre-orders, new celebrity playlists and iTunes Essentials, and other fun stuff.

Right Column Items

In a Hurry?
The Quick Links pane gives you immediate access to additional services like searching, account maintenance, support and other purchasing options like buying and redeeming iTunes gift cards.

Browse
If you want a quick way to scope out audio files by genre or sales charts, TV shows and videos, or chart-topping music, click **Browse** to display the browser, which lists several music genres and store categories including audiobooks and podcasts. Select any item to display a submenu (if applicable) in the next pane and keep picking stuff until you find what you want. You should wind up with a list of audio or video files for your selection in the preview pane. To get a 30-second preview of any song or a 20-second preview of any video, just choose an item and double-click it.

Power Search for stuff
If you know what you're looking for, you can search for things by typing names or words in the Search iTunes Store field in the top-right corner of the iTunes window or click **Power Search**. The Power Search pane provides search fields for Song, Artist, Album, and Composer, as well as a Genre pop-up menu (drop-down menu in Windows) to enter your criteria as needed. This way, you can search for, say, the band "The Killers" without having to see every "killer" song.

Account
Review and change all your important account information, including name, address, credit card numbers, reviewing nickname, and the iTunes Terms of Service and Privacy policies.

Gift-giving options and redemptions
You don't need a credit card to buy music, videos, and audiobooks. You can use iTunes Gift Certificates, Gift Cards, an Allowance, or even redeem free song codes in the iTunes Store. You can also give an Allowance and purchase iTunes Gift Certificates too. Buy and Redeem allows you to purchase and send gift cards, or add funds to an account to allow—or limit—how family members can make iTunes purchases.

Got a Problem?
Support gives you direct access to on-line customer service, billing support, trouble-shooting resources, and general tips and advice for new users.

Just Looking—For Other Suggestions?
Just as the left-side column displays the top-10 lists for video, the right-side column show the top lists for Top Songs, Top Albums, Top Audiobooks, and Top Podcasts.

Today's Top Songs
This pane displays the day's top 10 most downloaded songs. You can click any of the songs listed to go to that album's (or song's) page in which you can preview the song, purchase it, and even buy the entire album. If you want to see all other songs vying for the iTunes Store popularity contest.

Today's Top Albums
Below Top Songs, you'll find a section dedicated to the top downloaded albums of the day. Like the Top Songs, the Top Albums pane displays the current top 10 most downloaded albums—click any album in the list to view that album's page. Click any album to go to that album's page.

Today's Top Audiobooks
Midway down the right column, you'll find a pane that lists the top five most downloaded audiobooks of the day. Click any audiobook to go to that audiobook’s page.

Today's Top Podcasts
At the bottom of the right column, you'll find the list of the top five most downloaded podcasts of the day. Click any podcast to go to that podcast’s page.

1. Some features for the iTunes Store mentioned in these lessons are not available in all stores, including AOL login, TV shows, and movies.

How to Browse and Buy Videos from the iTunes Store

This article has been archived and is no longer updated by Apple.

Not only can you purchase music and audiobooks from the iTunes Store, with iTunes 7 or later you can buy music videos, movies, and even television shows[1] that play directly in iTunes. If you have Apple TV, you can view purchased videos on your TV. And if you've got a Fifth Generation iPod (with video), you can copy videos to your player to watch videos whenever and wherever you want. Here's how to browse, preview, and purchase videos.

- Browse and Buy Music Videos
- Browse and Buy Movies
- Browse and Buy TV Shows

Important Information about your iTunes Purchases

Digital Rights Management (DRM) protected video files purchased from the iTunes Store are protected by FairPlay, Apple's digital rights management system. FairPlay allows you to play your music on up to five computers at a time, enjoy unlimited syncing with iPods, and sync to up to five Apple TVs.

The iTunes Store also offers music videos without DRM protection, from participating record labels. These DRM-free songs, called "iTunes Plus," have no usage restrictions and feature higher-quality encoding. There are no burn limits and iTunes Plus music will play on all iPods, Mac or Windows computers, Apple TVs, and many other digital music players.

For more information about FairPlay authorization, see the "Authorization FAQ" page on the iTunes Store Customer Service page.

Browse and Buy Music Videos

Why wait for music channels to play your favorite music videos when you can own your own copy from the iTunes Store?

If you want a little visual to go with your music, check out the 9000+ music videos available in the iTunes Store—just click the Music Videos link in the left column under iTunes Store. Like other iTunes Store pages, the Music Videos store features the same familiar sections. You can browse the various sections for videos, click a genre under **GENRES** in the left column, or type an artist's name in the Search iTunes Store field in the upper-right corner to see videos (and music) from that artist.

Click any item to go to that music video's purchase page, which displays a Preview button, the purchase price, and all other music videos available for that artist. If you browsed for videos by genre, you can view a music video's page by clicking the small arrow button to the right of the music video name in the video list pane (all video files that appear in a list pane will display a TV icon next to their name so you can tell them apart from music files).

You can preview and purchase your chosen video on any music video page, as well as view all other videos available for that artist.

Click the Preview button to watch a 20-second snippet of your chosen video play on the page (or double-click a video listing if you're viewing a selection in the video list pane). You can also click any other video on a page to go to that music video's page and get a preview.

1-Click Shopping
If you set up the store for 1-Click shopping, simply click any "Buy Video" button to immediately purchase and download that video to your iTunes library. iTunes adds the video to your Purchased playlist in the Source list so you can keep track of all purchases you've made from the store.

With 1-Click shopping, you'll see "Buy Video" buttons, which let you purchase and download videos with a simple click.

Shopping Cart
If you've opted to use a shopping cart, click any "Add Video" button to add that video to your shopping cart, which appears in the iTunes Source list under Store (click the disclosure triangle next to Store if you don't see Shopping Cart listed).

If you see "Add Video" buttons, clicking them adds videos to a virtual shopping cart from which you can purchase and download items.

If you want to see what's in your shopping cart, just choose Shopping Cart in the Source list. Your pending purchases are listed in a preview pane just like what you see in any album or singles page. You can choose to buy everything in your shopping cart or buy items singly if that's your prerogative. Your total purchase price for everything in your cart appears at the bottom of the window.

To buy everything, click the "Buy Now" button at the bottom-right corner of the window. If you only want to buy certain items, click the "Buy Video" button next to the video you want. iTunes downloads your purchases to your iTunes library and adds the video to a Purchased playlist in the Source list so you can keep track of what you've bought from the store. To remove an item from your shopping cart, click the round X button to the right of a "Buy" button, or choose an item and press Delete on your keyboard.

With shopping cart purchases, you can decide to buy everything in your cart or choose the items you want.

Browse and Buy movies

Watch big screen cinema in the palm of your hands, browse through a full catalog of old and new releases available for purchase and download.

Enjoying a night at the movies is now easier than ever when you download Movies from the iTunes Store. You can find all your favorite classics, as well as latest releases, from film studios such as Disney, Paramount, and Lionsgate. From the iTunes Store, click Movies to access a catalog filled with great movies and short films available for purchase.

Just click any movie poster to view details about that movie, read the plot summary, view a trailer, or check out the customer reviews. When you're ready to purchase, click the Buy Movie or Add Movie icon, you can also send a movie as a gift to your family or friends. Following the download, you can sync it with your iPod or enjoy your movie selection on your computer in iTunes. You can also sync or stream the movie to an Apple TV.

Browse and Buy TV Shows

No need to stay home and be a couch potato. The iTunes Store features lots of new and vintage shows for purchase that you can view on your computer, Apple TV, or iPod anywhere.

Forget programming your VCR, setting TiVo, or rushing to get home on time to catch your favorite TV show. You just might find it in the iTunes Store. Just click TV Shows under iTunes Store in the left column on the iTunes Store homepage to view all of the television shows available for purchase.

The TV Shows store is set up just like our music and audiobooks store and features current hit shows such as Lost, The Office, Desperate Housewives, Monk, and Law & Order, as well as classics including Alfred Hitchcock Presents, Dragnet, and Knight Rider. You'll also find various sketches from Late Night with Conan O'Brien and The Tonight Show with Jay Leno.

Just click any show icon, choose a show from the Top TV Shows chart in the right column, or choose a network from the Network section in the left column and then a show from there to go to a show's page. Each show page displays all of the episodes available for each season—you'll see the current season, but you can check out all back episodes too by clicking a Previous Season icon if there are more episodes available.

Just double-click any episode to view a 20-second preview (by default, iTunes plays the clip in the artwork and video viewer pane).

To preview any episode, choose one in the preview pane, then double-click it to watch a 20-second clip. You can buy individual episodes (click

the "Buy Episode" or "Add Episode" button), a group of episodes within the current season (click the "Buy All Episodes" or "Add All Episodes" button), or purchase an entire season (click the "Buy Season" or "Add Season" button). To purchase a TV show, follow the same instructions for buying music videos here.

About contacts, schedules, and notes on your iPod

This article has been archived and is no longer updated by Apple.

Why carry around business cards, sticky notes, or scraps of paper when you can store your contacts, schedules, to-do lists, and other notes on your iPod?

If you want to have phone numbers, email addresses, meeting times, grocery lists, driving directions, and other bits of information at your fingertips, you can stick the data in any iPod model with a display screen. And every iPod allows you to use it as a "disk drive" to shuttle your projects and music files between your computers. Here are the ways iPod can make your life easier for those times when you need to get your life in order.

- Organize My Contacts and Schedule
- Take a Note
- Viewing my Contacts, Schedule, and Notes on my iPod
- Shuttle My Projects and Music

Organize My Contacts and Schedule

If you've got contacts on your computer, you can easily turn your iPod into a more sophisticated version of your little black book.

If you've got phone numbers, email addresses, and other personal information for those very important people in your life stored on your computer, you can easily take it all with you on your iPod.

If you're using a Mac, you can easily sync contacts in Address Book with your iPod. If you're using Windows, you can easily sync contacts from Microsoft Outlook or Outlook Express. Alternatively, you can transfer contact information from any Mac or Windows contacts manager that can export (or supports) contacts in vCard (.vcf) file format, such as Palm Desktop, Microsoft Entourage, and Eudora.

Syncing Contacts and Calendars on a Mac

On a Mac, you can use iTunes to sync contacts from Address Book, or your calendars from iCal, directly to your iPod. Check out "Mac OS X 10.4: Use iTunes for iPod syncing" to see how on a Mac.

Syncing Contacts and Calendars on Windows

On Windows, you can use iTunes to sync contacts from your Outlook or Outlook Express address book, or your calendar from Microsoft Outlook, directly to your iPod. Check out "Syncing contacts and calendars to iPod with iTunes for Windows" to see how on Windows.

Adding Contacts Manually (Mac and Windows)

You can easily copy contacts from popular address book applications and programs on either your Mac or Windows PC by simply dragging vCard files directly into the Contacts folder on your iPod.

If you don't have iCal or one of the Windows Outlook applications, you can still add contacts from other popular address books and calendars manually, by using vCards. Check out "iPod: Importing Contacts and Appointments" to find out how.

Take a Note

TA24468_About_contacts_schedules_and_notes_on_your_iPod.pdf

To read text files on your iPod, just convert them to plain text files and drag them into the Notes folder on your iPod.

Grocery lists, to-do items, driving directions, a cheat sheet that details your blind date's interests—if you can type (or copy) a note, you can take it with you on your iPod and refer to it as often as needed. Just remember to keep your notes fairly brief—you can cram in up to 4096 characters (4 KB total) per note.

To see how to make your iPod "notable", check out "Storing and reading notes with your iPod".

Viewing my Contacts, Schedule, and Notes on my iPod

Viewing Contacts

When you're done copying your contacts, click the eject button next to your iPod icon in the Source list, then disconnect your iPod from your computer. To view your contacts, just choose **Extras > Contacts** to view a list of your contact names (to change how these are sorted and displayed, see the Contacts section of "What's on the Menu." To view the details, use the Click Wheel to highlight a name and press the Center button.

Viewing Calendars

When you're done copying your calendars, click the eject button next to your iPod icon in the iTunes Source list, then disconnect your iPod from your computer. To view your schedule, just choose **Extras > Calendars**. To view your entire schedule (all calendars together), select All. To view an individual calendar, choose its name in the list.

Your iPod displays a calendar graphic marked by flags, which indicate an event (or scheduled item). To view an event, use the Click Wheel to scroll to the date, press the Center button to view a list of all events for that date, then choose an item to view its details.

Viewing Notes

When you're done copying over your notes, click the eject button next to your iPod icon in the iTunes Source list, then disconnect your iPod from your computer. To view your notes, just choose **Extras > Notes** to view a list of all notes on your iPod. To read one, scroll the Click Wheel to highlight its name and press the Center button (use the Click Wheel to scroll down the document too).

Shuttle My Projects and Music

If you haven't already figured it out by now, you can use any iPod model as an external hard drive, allowing you to copy files onto it and shuttle items from one computer to another. This comes in handy if you need to work on projects at the office or school and at home, or you want to transfer your digital music collection from your old computer to a new one. Here's how to enable this feature.

QuickTime: Quality settings for BMP export cannot be changed

This article has been archived and is no longer updated by Apple.

When exporting to BMP format in QuickTime Pro, you may notice that any changes you make to the "Quality" slider in the Export Options window revert back to the default settings.

This is expected behavior based on available specifications for the BMP codec. Quality specifications are not available for the BMP codec.

Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

Intel-based Macs audio may get out of sync with input source

This article has been archived and is no longer updated by Apple.

Issue or symptom

The computer's audio and input source may go out of sync when a device is plugged in or removed from the line-out jack while monitoring the input source.

Solution

Stop and restart the playback. If this doesn't work, close the application you are using and open it again, then start the playback again.

Boot Camp Beta 1.1.2: Disable wireless if Apple external USB modem disconnects unexpectedly in Windows XP

This article has been archived and is no longer updated by Apple.

Issue or symptom

With Boot Camp Beta 1.1.2 and Windows XP, an Apple external USB modem may not connect or may remain connected to an ISP for only a few minutes, then disconnect unexpectedly.

Solution

In some cases, disabling 802.11 wireless networking in Windows XP may resolve the issue.

Warning: Boot Camp Beta is preview software licensed for use on a trial basis for a limited time. Do not use Boot Camp Beta in a commercial operating environment or with important data. You should back up all of your data before installing this software and regularly back up data while using the software. Your rights to use Boot Camp Beta are subject to acceptance of the terms of the software license agreement that accompanies the software.

Important: Apple does not provide technical phone support for using Boot Camp Beta, burning the Macintosh Drivers CD, or installing Windows XP. Support is available on Apple's website. Fee-based support agreements are not available for Boot Camp Beta.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Holding the Volume Down button while docking may prevent iPod shuffle (Second Generation) from being recognized by iTunes

This article has been archived and is no longer updated by Apple.

While connecting your iPod shuffle (Second Generation) to the dock, inadvertently pressing and holding the Volume Down button (-) may cause the iPod to not be seen by iTunes. If this happens, follow these steps:

Mac users

1. Remove iPod shuffle (Second Generation) from the dock.
2. Reset your iPod shuffle (Second Generation). To reset, switch the power on, then off—and leave the power off for 5 seconds. This will reset your iPod.
3. Reconnect your iPod shuffle (Second Generation) to the dock for it to be properly recognized.

Windows users

1. In the Notifications area of the Taskbar, left-click the Safely Remove Hardware icon.

Note: If you don't see the Safely Remove Hardware icon in the Taskbar, you can remove iPod shuffle (Second Generation) from the dock.

2. Choose **Safely remove USB Mass Storage Device - Drive(E:)** from the shortcut menu. In some cases, the drive letter may be different. If you have other USB drives attached, you may need to repeat this if you're not sure which drive letter corresponds to your iPod.

3. Reset your iPod shuffle (Second Generation). To reset, switch the power on, then off—and leave the power off for 5 seconds. This will reset your iPod.
4. Reconnect your iPod shuffle (Second Generation) to the dock for it to be properly recognized.

Mac OS X 10.4.8: Account password can‘t be changed on some Intel-based Macs

This article has been archived and is no longer updated by Apple.

Issue or symptom

After updating to Mac OS X 10.4.8 on some Intel-based Macs, a non-administrator user might not be able to change their password.

Solution

Download and install the Mac OS X 10.4.8 Combo Update (Intel).

This document will be updated as more information becomes available.

Published Date: Oct 7, 2016

TA24476_Aperture_Trial_version_cant_be_updated_to_version_.pdf

Aperture: Trial version can‘t be updated to version 1.5.1

This article has been archived and is no longer updated by Apple.

Issue or symptom

After you install the Aperture 1.5 Trial version, you can't update to Aperture 1.5.1.

Solution

This is expected—the Aperture 1.5 Trial version cannot be updated while running with a trial serial number. If you buy Aperture from the Trial, it is possible to update to 1.5.1 after you have entered the full serial number.

There is one scenario where Software Update may offer the Aperture 1.5.1 update after you install the Aperture 1.5 Trial. If you install the trial version and run Software Update before launching the Aperture Trial for the first time, Software Update will offer Aperture 1.5.1. Do **not** install the update—it will render the trial serial number inoperative. If you have already updated the trial version, just delete the Aperture application from `/Applications` and then reinstall the Aperture 1.5 Trial.

Play podcasts with iPod

This article has been archived and is no longer updated by Apple.

If you haven't heard of it by now, podcasting is the new generation of entertainment media that allows listeners to subscribe to radio-style shows available on the Internet that get downloaded to their computers automatically. It's like listening to a radio show on demand.

With podcasts, you're no longer strapped with having to wake up early, stay up late, or hunker down at work or in class with headphones on just to catch a radio show—you can choose when and where to listen to shows. With iTunes 4.9 and later, you can browse for podcasts, preview episodes, subscribe to and download podcasts, play them, and sync them to your iPod for play while you're on the go.

Rather than scour the web, you can find tons of podcasts to subscribe to (for free!) in the iTunes Store.

Podcasts come in a lot of varieties—everything from glossy news, music, or talk shows to verbal blogs from regular folks from around the globe. The ones offered on the iTunes Store are free, but others may charge a subscriber fee. You'll find professionally created podcasts from major broadcasters (such as ESPN, NPR, CNN, the Wall Street Journal, and Disney), shows from known personalities (including Rick Steves, Ebert & Roeper, the Simpsons, and Adam Curry), and plenty of stuff from lesser knowns who are finding new celebrity in this new medium. For more information about podcasts, be sure to visit our Podcasting page.

iTunes displays podcasts you've downloaded in the Podcasts section in the Source pane too, making finding them easy. Just choose Podcasts in the iTunes Source pane to view the pane. Of course, if you haven't subscribed to any podcasts, your list will be empty, but it doesn't have to stay that way for long. One of the best sources to find podcasts is none other than the iTunes Store, and these podcast subscriptions won't cost you a penny.

Show Me How

Browse, Preview, Subscribe to, and Play Podcasts

To find, preview, subscribe to, download, and play a podcast from the iTunes Store and then copy it to your iPod, do this:

1. In the Podcasts pane in iTunes, click the "Podcast Directory" link at the bottom part of the iTunes window. The iTunes Store opens in your iTunes window, displaying a selection of podcasts.
2. If any podcast displayed or listed on the podcast homepage catches your eye, you can click it to access it. Or browse for podcasts by typing a word or words in the “Search iTunes Store” field in the upper-right corner of iTunes, clicking a category of interest from the Categories list below search, or clicking the item in the CATEGORIES list in the right-column. For browsing purposes, click the "Comedy" link under CATEGORIES.
3. You'll see podcast listings organized by provider, popularity, release dates, and other helpful categories in the resulting window. Scope out the contents. Then click on any show name or graphic that catches your eye to view its details.
4. A typical podcast's page includes details such as the show name, description, subscription fee (if any—most say "Free"), and associated website (if applicable). It'll also list all available podcast episodes. To preview an episode, choose one from the list and double-click it.

Most will provide a 1 minute, 30 second preview of the show. Others will stream the whole show to you. Listen to as many previews as you like. If you see an "i" icon next to an episode description, you can click it to reveal more details about the show.

5. When you find a podcast that you like and want to subscribe, click the Subscribe button. A dialog opens, asking if you're sure that you want to subscribe. If that is your intent, click Subscribe.

To subscribe to a podcast, simply click its Subscribe button in any page.

6. iTunes downloads the most recent episode and will automatically download future episodes whenever you open iTunes. To view your new subscription, choose Podcasts in the Source pane. If the individual episodes aren't displayed, click the disclosure triangle to the left of the podcast name to reveal them. If an episode is dimmed, it hasn't been downloaded to your computer (these are older episodes); if you want it, click the Get button next to it.
7. To play a podcast in iTunes, simply double-click the episode to hear it.
8. To copy a podcast to your iPod, either enable podcast syncing or drag any episode to your iPod icon in the Source pane.

Voice Your Own Podcast

If you're looking to break into the broadcasting industry or simply want to take blogging (or your opinions) to an audible worldwide level, consider creating your own podcast. All you need is a computer with recording software to capture your talent, a server to host the file, and a little imagination and planning.

Whether you use GarageBand or other audio recording software, you can create your own podcast without much effort.

If you're using a Mac and have GarageBand, you can easily create your own podcast complete with music, pictures, and web links. We provide some guidance, tips, and instruction on our "GarageBand: Recording Your Podcast" page. You can also use QuickTime 7 Pro; see "Creating Podcasts with QuickTime 7 Pro" for instructions.

If you're a Windows users, you can follow the same instructions for GarageBand but substitute your preferred audio recording application for GarageBand (the concepts and principles are the same). Or follow the same instructions for QuickTime 7 Pro.

About the Mac OS X Server 10.4.9 (PowerPC) Update (delta)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server 10.4.8 (PowerPC) to version 10.4.9.

Note: PowerPC-based Macintosh Servers with Mac OS X Server (Universal) 10.4.8 installed should use the Mac OS X Server (Universal) 10.4.9 Update (delta) instead.

The 10.4.9 Server Update is recommended for all PowerPC-based servers and includes fixes for the operating system and various applications, services and technologies.

Note: Apple recommends installing the Mac OS X 10.4.9 client update on client machines in conjunction with updating Mac OS X Server to 10.4.9. Also, if your PowerPC server has Mac OS X Server 10.4.7 or 10.4.8 (Universal) installed, you should use the Mac OS X Server 10.4.9 (Universal) Update (combo) or Mac OS X Server 10.4.9 (Universal) Update (delta), respectively. For Xsan installations, all connected clients and servers must be updated to version 10.4.9 in order to benefit from the Xsan-related inclusions in this update.

Important: Please Read Before Installing

You must have an administrator account password that does not contain Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).

You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.

The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.9. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.9: Use Software Update or install from a standalone installer. Software Update installation Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Note: Do not use the "Download Only" or "Install and Keep Package" options in Software Update. The resulting download will not install on your server.

If you need a standalone installer, follow the instructions in the next section.

Standalone installer

A standalone installer is also available from Apple Downloads. The Mac OS X Server 10.4.9 (PowerPC) Update (Delta) specifically updates version 10.4.8 (PowerPC) to version 10.4.9.

There is also a combo update installer available, which will update any version of Mac OS X Server 10.4 (PowerPC) to 10.4.9.

Remote installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool or the Server Admin application. Information about the Server Admin application can be found here.

What's included?

File Sharing Services

- Addresses AFP connection issues when authenticating Active Directory users who are members of several groups.
- Resolves SMB/CIFS server deadlocks and service interruption issues.
- Addresses NFS server non-responsiveness at shutdown.

Directory Service

- Improves authentication of Windows clients that are bound to Active Directory.
- Addresses an issue that could prevent Open Directory authentication when using Ethernet Link Aggregation Print Service.

- Addresses slow performance of non-cached DNS queries and provides an update to BIND version 9.3.2.

Print Service

- Resolve an issue that could produce many more copies of a document than were requested, when using the Print Server DNS.

Networking

- Better TCP performance for Windows clients and servers.

File System

- Resolves issues with using rsync to copy files that have extended attributes.
- Issues with copying read-only files to AFP shares on Xsan and UFS volumes are addressed.
- Resolves issues copying files with extended attributes from an AFP share of an Xsan volume.
- Addresses an issue affecting Mac Pro client connections to AFP service.
- Addresses an issue that could cause reduction of performance when browsing AFP directories.

Other

- Creating and managing VLANs from the command-line is now possible.
- Resolves an issue with setting startup wait period after a power loss.
- Includes the latest worldwide time zone and Daylight Saving Time (DST) rules as of January 8, 2007 (2007-01-08).
- Directory listings are now properly displayed after moving directories with 'mv'.
- This update also includes recent security updates for Mac OS X Server 10.4; for detailed information on Security Updates, see this article: http://www.info.apple.com/kbnum/n61798.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About the Mac OS X Server 10.4.9 (PowerPC) Update (combo)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server (PowerPC) versions 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, 10.4.7 and 10.4.8 to Mac OS X Server 10.4.9. It is a "combo" update that combines updates delivered with versions 10.4.1 through 10.4.9. If you already have Mac OS X Server 10.4.8 (PowerPC), you can download a smaller update to update to version 10.4.9.

The 10.4.9 Server Update is recommended for all PowerPC-based servers and includes updates for the operating system and various applications, services and technologies. **Note**: Apple recommends installing the Mac OS X 10.4.9 Client update on client machines in conjunction with updating Mac OS X Server to 10.4.9. Also, if your PowerPC server has Mac OS X Server 10.4.7 or 10.4.8 (Universal) installed, you should use the Mac OS X Server 10.4.9 (Universal) Update (combo) or Mac OS X Server 10.4.9 (Universal) Update (delta), respectively. For Xsan installations, all connected clients and servers must be updated to version 10.4.9 in order to benefit from the Xsan-related inclusions in this update.

Important: Please read before installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.9. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.9: Use Software Update or install from a standalone installer.

Software Update installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."
Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.
Note: This version of Mac OS X Server is built as a multi-package and should not be used with Software Update's "Download Only" and "Install and Keep Package" options. If you need to save these packages for later use, try the manual update instead.

Standalone installer

A standalone installer is also available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, you can do so using the softwareupdate command-line tool.

What's included?

This update delivers many fixes. Because this is a combo update, it includes fixes delivered with the Mac OS X Server 10.4.9 delta update as well as these previous Mac OS X Server 10.4.x updates: 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, 10.4.7 and 10.4.8.

Published Date: Oct 7, 2016

About the Mac OS X Server 10.4.9 (Universal) Update (delta)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server 10.4.8 (Universal) to version 10.4.9. **Note**: If you have PowerPC-based Macintosh Servers with Mac OS X Server 10.4.8 (PowerPC) installed, you should use the Mac OS X Server (PowerPC) 10.4.9 Update instead.

The 10.4.9 (Universal) Server Update is recommended for all servers currently running Mac OS X Server (Universal) versions 10.4.7 or 10.4.8, and includes updates for the operating system and various applications, services and technologies.

Note: Apple recommends installing the Mac OS X 10.4.9 Client update on client machines in conjunction with updating Mac OS X Server to 10.4.9. Also, if your PowerPC server has Mac OS X Server 10.4.x (PowerPC) installed, you should use the Mac OS X Server 10.4.9 (PowerPC) Update (combo) or Mac OS X Server 10.4.9 (PowerPC) Update (delta), as appropriate. For Xsan installations, all connected clients and servers must be updated to version 10.4.9 in order to benefit from the Xsan-related inclusions in this update.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

Mac OS X 10.4.8: Activity Monitor shows AirPort process taking unexpected CPU time, computer runs "slow" with third-party VPN client

This article has been archived and is no longer updated by Apple.

Issue or symptom

After updating to Mac OS X 10.4.8, if some third-party VPN client software is installed, Activity Monitor may show the AirPort process taking 90% or more of the CPU time, and the computer may seem "slow".

Solution

Make sure your third-party VPN client software is up-to-date. Contact your network administrator or the manufacturer of your VPN client software.

This document will be updated as more information becomes available.

iPod shuffle (Second Generation): LED behavior after charging

This article has been archived and is no longer updated by Apple.

Issue or symptom

You may notice that the status light on the iPod shuffle may not change from orange to green after prolonged charging (two or more hours).

Solution

If you observe this condition, you should take the following steps.

1. Disconnect the iPod shuffle (Second Generation) from the dock.
2. Turn the iPod shuffle (Second Generation) off.
3. Wait for 5 to 10 seconds.
4. Turn the iPod shuffle (Second Generation) back on.

The status light on the iPod shuffle (Second Generation) should now be green indicating that it is charged.

Mac OS X 10.4: "Mail cannot update your mailboxes because your home directory is full" alert

This article has been archived and is no longer updated by Apple.

Issue or symptom

While opening Mail, you may see this alert message even if your Home is not full:

"Mail cannot update your mailboxes because your home directory is full. You must free up space in your home folder before using Mail. Delete unneeded documents or move documents to another volume."

Solution

Verify that your home directory is not full

Choose **Home** from the Finder's **Go** menu and make sure the volume is not full by checking the space available on the drive.

If it is full you can free up space on the volume by removing (or archiving to a different volume) files and documents such as ones in your Documents folder and on your desktop.

If your home directory is not full

1. Quit Mail if it's running.
2. Choose **Go to Folder** from the Finder's **Go** menu, then type :
   ~/Library/Mail/
3. Move the file named "Envelope Index" to the desktop.
4. Open Mail. Your will be alerted that your Mail messages will be imported again. Click OK.

Once the issue is resolved, you can remove (delete) the "Envelope Index" file from your desktop

.

Mac OS X Server 10.4: How to renew a signed certificate

This article has been archived and is no longer updated by Apple.

Learn how to renew a signed certificate in Mac OS X Server 10.4 or later. A server certificate allows secure transactions between the server and clients. Certificates are provided by Certificates Authorities--organizations that are trusted to issue safe certificates. Some Certificate Authorities (CA) include Thawte, Verisign, and Entrust. Certificates normally expire after a period of time for security reasons.

Renewing an expired certificate

Important: These steps will leave your server without a certificate until the new certificate is issued. You can use a self-signed Certificate Authority and certificate to fill the gap. The clients will need the CA certificate to be added.

1. Refer to the Mac OS X Server Security Configuration Guide (chapter 8) to delete the expired certificate.
2. Refer again to the Mac OS X Server Security Configuration Guide to request a certificate from a CA and add it.

Renewing a certificate that has not yet expired

1. Open Terminal (/Applications/Utilities).
2. Execute this command to create a Certificate Signing Request:

   ```
   certtool r certrequest.pem k=CertRequest.keychain c
   ```

   Note: You cannot use Server Admin because it does not allow two certificates with the same common name.
3. Open Keychain Access (/Applications/Utilities).
4. Click Show Keychains.
5. Select CertRequest.
6. Export the private key.
7. Submit the certificate "certrequest.pem" to the Certificate Authority (CA) of your choice--the CA will explain you what to do with the CSR in order to purchase or renew a certificate.
8. After the CA provides you with a new certificate (typically it is mailed to you), log in as root on the server.
9. Open Keychain Access.
10. Locate the keys related to the existing certificate and export them (this works only as root).
11. Log out.
12. Open Server Admin.
13. In the Computers & Services list, select the server you are renewing a certificate for.
14. Click Settings.
15. Click Certificates.
16. Delete the existing certificate.
17. Click Import.
18. Select the certificate file and the private key file (the one exported in step 6 above).
19. Click Import.

If the import does not succeed, open the system log and look for the text "[CertificateManager importIdentity:]" to determine the cause of the issue and resolve it. You can import back the expiring certificate using the private key exported in step 10.

Xsan 1.4.1: PowerPC MDCs log quota messages and disappear from Computer List after updating Intel MDCs

This article has been archived and is no longer updated by Apple.

Issue or symptom

When upgrading heterogeneous Metadata Controllers, or MDCs, either Intel- or PowerPC-based, to Xsan 1.4.1, PowerPC-based MDCs may log quota messages and disappear from the Computer List until they are updated.

Solution

Be sure to upgrade all MDCs to Xsan 1.4.1. Once all MDCs are updated to Xsan 1.4.1, this issue should be resolved.

Apple CD ROM Drives: Using CD-RW Discs

This article describes the use of CD-RW discs with Apple CD-ROM drives.
This article has been archived and is no longer updated by Apple.
The only drives that are qualified to read CD-RW formatted discs are the 24x drives that are in desktop Power Macintosh computers (including iMac).

PowerBook CD-ROM Drives and older desktop CD-ROM drives may read some of the discs but it would be unsupported and unreliable. CD-RW is really designed as a backup format for a computer with a CD-RW drive. If you want to use CDs made on other Macintosh computers the CDs should be formatted as CD-R instead of CD-RW.

About the security content of Apple Remote Desktop 3.1

This article has been archived and is no longer updated by Apple.

This document describes the security content of Apple Remote Desktop 3.1, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Apple Remote Desktop 3.1

- **Apple Remote Desktop**

  CVE-ID: CVE-2006-4413

  Available for: Apple Remote Desktop 3.0

  Impact: Malicious local users may be able to modify packages used to install or upgrade client systems

  Description: Apple Remote Desktop includes built-in packages used to install and upgrade client systems. The permissions on these packages could allow them to be altered by malicious local users on Apple Remote Desktop admin systems. This could lead to the execution of arbitrary commands with root privileges on client systems when Apple Remote Desktop client software is installed or upgraded. This issue has been addressed by applying more restrictive permissions on the built-in installation packages. Credit to Andrew Mortensen of the University of Michigan for reporting this issue.

QuickTime Pro: About annotations in Mobile MP4 3GPP movies

This article has been archived and is no longer updated by Apple.

QuickTime Pro enables content creators to export movie files in 3GPP formats that can be played on mobile devices. If you export a movie in the Mobile MP4 3GPP format, it's important to note that only certain annotation fields will be present in the resulting movie.

Supported Annotation Fields:

- Title
- Author
- Copyright
- Description

For example, if your source movie contains annotations for Comment, Title and Description, the resulting 3GPP Mobile MP4 format movie will only contain the Title and Description annotations.

More information about QuickTime, 3GPP, and other mobile formats is available from the QuickTime Mobile Technologies page.

Security Update 2006-007

- **AirPort**

  CVE-ID: CVE-2006-5710

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Attackers on the wireless network may cause arbitrary code execution

  Description: A heap buffer overflow exists in the AirPort wireless driver's handling of probe response frames. An attacker in local proximity may be able to trigger the overflow by sending maliciously-crafted information elements in probe responses. This issue affects eMac, iBook, iMac, PowerBook G3, PowerBook G4, and Power Mac G4 systems equipped with an original AirPort card. This issue does not affect systems with the AirPort Extreme card. This update addresses the issue by performing additional validation of probe response frames. Credit to H D Moore of Metasploit for reporting this issue.

- **ATS**

  CVE-ID: CVE-2006-4396

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Local users may be able overwrite or create files with system privileges

  Description: The Apple Type Services server insecurely creates error log files. As a result, a malicious local user may be able to overwrite or create files with system privileges. This update addresses the issue by creating error logs securely.

- **ATS**

  CVE-ID: CVE-2006-4398

  Available for: Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Local users may be able to run arbitrary code with raised privileges

  Description: Multiple buffer overflows were discovered in Apple Type Services server. By sending a maliciously-crafted service request, a local user may trigger these overflows. This may lead to a crash or arbitrary code execution with system privileges. This update addresses the issue by performing additional validation on service requests. This issue does not affect systems prior to Mac OS X v10.4.

- **ATS**

  CVE-ID: CVE-2006-4400

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Viewing maliciously-crafted font files may lead to arbitrary code execution

  Description: The Apple Type Services server contains a stack buffer overflow in font processing. By carefully crafting a corrupt font file, an attacker can trigger the buffer overflow which may lead to a crash or arbitrary code execution with system privileges. Font files are processed when opened or previewed in Finder. This update addresses the issue by performing additional validation of font files.

- **CFNetwork**

CVE-ID: CVE-2006-4401

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

Impact: Visiting FTP URIs may inject arbitrary FTP commands

Description: By enticing a user to access a maliciously-crafted FTP URI, an attacker can cause the user's FTP client to issue arbitrary FTP commands to any accessible FTP server, using the credentials of the victim. This issue may also facilitate attacks of other line oriented protocols, such as SMTP. This update addresses the issue by performing additional validation of URIs.

- **ClamAV**

  CVE-ID: CVE-2006-4182

  Available for: Mac OS X Server v10.4.8

  Impact: Processing maliciously-crafted email messages with ClamAV may lead to arbitrary code execution

  Description: ClamAV is updated to version 0.88.5 to address several security issues. ClamAV was introduced in Mac OS X Server v10.4 for email scanning. The most severe of these issues could lead to arbitrary code execution with the privileges of ClamAV. Further information is available on the ClamAV project web site (www.clamav.net).

- **Finder**

  CVE-ID: CVE-2006-4402

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Browsing a shared directory may lead to an application crash or arbitrary code execution

  Description: A heap buffer overflow may be triggered when the Finder is used to browse a directory containing a corrupt ".DS_Store" file. By enticing a user to browse a directory containing a maliciously-crafted ".DS_Store" file, an attacker may be able to trigger the overflow. This could lead to an application crash or arbitrary code execution with the privileges of the user running Finder. ".DS_Store" files may be included in archives, on disk images, and on network file systems. This update addresses the issue by performing additional validation of ".DS_Store" files.

- **ftpd**

  CVE-ID: CVE-2006-4403

  Available for: Mac OS X v10.3.9

  Impact: When FTP Access is enabled, unauthorized users may determine account name validity

  Description: When attempting to authenticate a valid user, the FTP server may crash during a failed login attempt. The crash does not occur when attempting to authenticate unknown users. This behavior can be used to determine if an account name is valid. This issue is addressed by resolving the crash condition. FTP Access is not enabled by default. Mac OS X Server v10.3.9, Mac OS X v10.4, Mac OS X Server v10.4, and later systems are not affected. Credit to Benjamin Williams of the University of Canterbury for reporting this issue.

- **gnuzip**

  CVE-ID: CVE-2006-4334, CVE-2006-4335, CVE-2006-4336, CVE-2006-4337, CVE-2006-4338

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Uncompressing a file with gunzip may lead to an application crash or arbitrary code execution

  Description: By carefully crafting a malicious compressed file, an attacker may be able to trigger any of several vulnerabilities in gunzip when the file is processed. The most severe of these issues could lead to an application crash or arbitrary code execution. Many applications use the gunzip command for decompression, including command-line tools such as tar and services such as Mail Server. This update addresses the issue by performing additional validation of compressed files. Credit to Tavis Ormandy of the Google Security Team for reporting this issue.

- **Installer**

  CVE-ID: CVE-2006-4404

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: When installing software as an Admin user, system privileges may be used without explicit authorization

Description: Admin users are normally required to authenticate before executing commands with system privileges. However, the Installer allows system privileges to be used by Admin users when installing certain packages without requiring authentication. This update addresses the issue by requiring authentication before installing software with system privileges.

- **OpenSSL**

  CVE-ID: CVE-2006-2937, CVE-2006-2940, CVE-2006-3738, CVE-2006-4339, CVE-2006-4343

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Multiple vulnerabilities in OpenSSL

  Description: OpenSSL is updated to version 0.9.7l to address several critical vulnerabilities. The most severe of these vulnerabilities may lead to impersonation of services using SSL or TLS, or to arbitrary code execution. Further information is available via OpenSSL advisories at http://www.openssl.org/news/vulnerabilities.html.

- **perl**

  CVE-ID: CVE-2005-3962

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Perl applications with unsafe string handling may be vulnerable to arbitrary code execution

  Description: An integer overflow exists in Perl's format string functionality. This integer overflow may lead to arbitrary code execution in Perl applications which use format strings unsafely. This update addresses the issue by performing additional validation of uses of format strings.

- **PHP**

  CVE-ID: CVE-2006-1490, CVE-2006-1990

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: PHP applications may be vulnerable to denial of service or arbitrary code execution

  Description: PHP is updated to version 4.4.4 to address several security issues in the Apache module and scripting environment. Applications using affected APIs may be vulnerable. The most severe of the vulnerabilities may lead to arbitrary code execution. Further information is available on the PHP project web site (www.php.net).

- **PHP**

  CVE-ID: CVE-2006-5465

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: PHP applications may be vulnerable to arbitrary code execution

  Description: Buffer overflows exist in the htmlentities() and htmlspecialchars() functions. These buffer overflows may lead to arbitrary code execution in applications using the affected APIs. This update addresses the issue by performing additional validation of input to the affected APIs.

- **PPP**

  CVE-ID: CVE-2006-4406

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Using PPPoE on an untrusted local network may lead to arbitrary code execution

  Description: When PPPoE is enabled, an attacker on the local network may be able to trigger a buffer overflow. This could lead to a system crash or arbitrary code execution with system privileges. This update addresses the issue by performing better validation on PPPoE traffic. PPPoE is not enabled by default. Credit to the Mu Security research team for reporting this issue.

- **Samba**

  CVE-ID: CVE-2006-3403

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: When Windows Sharing is enabled, remote attackers may cause a denial of service

Description: The list of active connections tracked by Windows Sharing may grow unbounded. An attacker may be able to create many connections, leading to memory exhaustion and a denial of service. This update addresses the issue by limiting the number of active connections. Windows Sharing is not enabled by default.

- **Security Framework**

  CVE-ID: CVE-2006-4407

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: Secure Transport may not negotiate the best cipher available

  Description: Secure Transport provides the ability to encrypt and authenticate data using several ciphers. When a connection is made, the best mutually-supported cipher should be used. Due to the order they are evaluated, it is possible for Secure Transport to use a cipher that provides no encryption or authentication when better ciphers are available. This update addresses the issue by giving priority to better ciphers. Applications using Secure Transport through CFNetwork, such as Safari, are not affected by this issue on systems with Security Update 2006-006 or later. This issue does not affect systems using Mac OS X v10.4.8 and later. Credit to Eric Cronin of gizmolabs for reporting this issue.

- **Security Framework**

  CVE-ID: CVE-2006-4408

  Available for: Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Processing X.509 certificates may lead to a denial of service

  Description: It is possible to create an X.509 certificate containing a public key that could consume a significant amount of system resources during signature verification. An attacker may cause a system to process such a certificate, leading to a denial of service. This issue does not affect systems prior to Mac OS X v10.4. Credit to Dr. Stephen N. Henson of Open Network Security for reporting this issue, and to NISCC for coordinating.

- **Security Framework**

  CVE-ID: CVE-2006-4409

  Available for: Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: When using an HTTP proxy, certificate revocation lists cannot be retrieved

  Description: On systems that are configured to use an HTTP proxy, the Online Certificate Status Protocol (OCSP) service is unable to retrieve certificate revocation lists. This update addresses this issue by using the system proxy settings in ocpsd. This issue does not affect systems prior to Mac OS X v10.4. Credit to Timothy J. Miller of the MITRE Corporation for reporting this issue.

- **Security Framework**

  CVE-ID: CVE-2006-4410

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: Certain revoked certificates may be erroneously honored

  Description: The revocation list from an issuing authority may not be consulted for certain leaf certificates. This update addresses the issue through improved handling of the certificate revocation list. This issue does not affect Mac OS X v10.4.7 and later systems. Credit to Jose Nazario of Arbor Networks for reporting this issue.

- **VPN**

  CVE-ID: CVE-2006-4411

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Malicious local users may gain system privileges

  Description: Under certain circumstances, the VPN server may execute commands without properly cleaning the environment. This may allow a malicious local user to create files or execute commands with system privileges. This update addresses the issue by ignoring the user's environment when executing commands.

- **WebKit**

TA24494_About_the_security_content_of_Security_Update_.pdf

CVE-ID: CVE-2006-4412

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

Impact: Visiting a malicious web site may lead to arbitrary code execution

Description: A maliciously-crafted HTML document could cause a previously deallocated object to be accessed. This may lead to an application crash or arbitrary code execution. This update addresses the issue by properly handling such documents. Credit to Tom Ferris of Security-Protocols for reporting this issue.

Xserve: Server Monitor does not authenticate with server over subnet

This article has been archived and is no longer updated by Apple.

Issue or symptom

After changing a username or password with Server Monitor, the Xserve may stop authenticating remote Server Monitor users.

Solution

To correct this, perform the following steps:

1. Make the necessary changes to the username or password using Server Monitor.
2. Quit Server Monitor.
3. Shut down the Xserve that is the target of these changes.
4. Remove the power cord from the back of the Xserve.
5. Wait 30 seconds and plug the power cord back in.
6. Power the server back on.

Communicating with the Xserve with Server Monitor across subnets should now function as expected.

Aperture: Some Uncompressed DNG files show wrong color palette

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some DNG images created with Adobe DNG Converter 3.5 or later may have the wrong color palette when viewed in Aperture, Preview, or iPhoto.

Solution

Digital Camera RAW Support Update 1.0 added support for DNG files created using the Universal Binary versions of Adobe DNG converter (version 3.5 or later) on Intel-based Macs. Uncompressed DNG files created with this configuration may display an incorrect color palette.

This issue has been addressed in Digital Camera RAW Support Update 1.0.1. Any Uncompressed DNG files demonstrating this issue should be regenerated after the new update has been installed. Digital RAW Support Update 1.0.1 can be downloaded from here.

Canon EOS Kiss Digital X images not recognized after Digital Camera RAW Support Update 1.0

This article has been archived and is no longer updated by Apple.

Issue or symptom

In some cases, images from the Canon EOS Kiss Digital X camera are not recognized as supported, even after the Digital Camera RAW Support Update 1.0 has been installed.

Solution

Digital Camera RAW Support Update 1.0 provided support for the Canon EOS 400D / Canon Digital Rebel XTi, and implied support for the Canon EOS Kiss Digital X. However, it did not correctly support the Canon EOS Kiss Digital X. This was fixed in the Digital Camera RAW Support Update 1.0.1. The update can be downloaded from here.

Monitors: Influence of External Magnetic Fields

This document describes how external magnetic fields can affect the performance of a computer monitor.
This article has been archived and is no longer updated by Apple.
Magnetic fields can present image distortion or jitter on a computer monitor. External fields can impinge upon the monitor's internal magnetic field, which controls the electron beams writing the image on the screen. The external field interferes with or disrupts the internal field, causing the screen image to jitter, distort, drift, or to lose color quality.

Typical sources of external fields include common electrical equipment placed near the affected monitor, such as another monitor, video systems, scanners, fluorescent or task lights, electric clocks--just about anything that can be plugged in and turned on. Not so obvious sources include nearby power lines, transformers, switch panels, or wall and floor wiring.

Another source of external fields could come from metal cabinets that can build up a magnetic field over time. This magnetic field can easily be removed by using a degaussing coil on all the metal cabinets or desks that are near the display.

Xserve Intel (late 2006): Flashing question mark appears during start up

This article has been archived and is no longer updated by Apple.

Issue or symptom

You may encounter a flashing question mark when trying to start (boot) an Xserve Intel (Late 2006).

Solution

Make sure that the Xserve is not locked. If it is locked, use the Allen key that came with the server to unlock it.

After the Xserve has started, use Startup Disk preferences (in System Preferences) to select a valid system. Setting the startup disk will allow the computer to start properly even if it is locked.

Aperture: Using Watermarks in Aperture 1.5.2

This article has been archived and is no longer updated by Apple.

Aperture 1.5.2 includes a new *Scale watermark* setting in the export setting window that addresses issues regarding how watermarks are scaled when applied to exported images.

If the *Scale watermark* box is left unchecked, then the watermark will appear on your exported images at its actual pixel size, regardless of how your images are scaled. This replicates the behavior of watermarks in Aperture versions prior to 1.5.1. Let's say for example that you create a watermark that is 100 pixels by 100 pixels. If you apply the watermark to an export that is 50% of the Original Size, with the *Scale watermark* setting unchecked, the watermark will be 100 pixels square. If you export the same image at Original Size, the watermark will still be 100 pixels square (and will, therefore, take up less space on the resulting original-size image). Below are some examples:

Here is an image exported at it's original size without *Scale watermark*.

Here is the same image and watermark exported at 50 percent of original size, again without *Scale watermark*.

In this workflow, you would typically create watermarks of various sizes to use, depending on the final export size of the images.

If the *Scale watermark* box is checked, then the watermark size is scaled relative to the export size. This replicates the behavior of watermarks in Aperture 1.5.1. In this case, the size of the watermark (in terms of actual pixel dimensions) changes, depending on how the image itself is to be scaled. In this workflow, the watermark is automatically reduced in size so that it proportionally always takes up the same amount on space on your resulting exported images. Here are some examples of images exported with watermark scaling:

Here is an image exported at its original size, with *Scale watermark* enabled.

Here's the same image and watermark exported at 50 percent size, again with *Scale watermark* enabled.

Note however, that watermarks are never scaled up in size. If the export size is larger than the original image, the watermark will not scale.

Aperture: Tips on using a RAW+JPEG workflow in Aperture

This article has been archived and is no longer updated by Apple.

Some cameras can be configured to create both a RAW and JPEG file for each shot you take, and Aperture is well suited for maintaining and working with both masters of each image. Here are some tips on using RAW+JPEG in Aperture.

Importing Images

When you import RAW+JPEG, the Import Panel will only show the RAW images on the memory card or other media, but the JPEG master of the images will still be imported. If you don't want both the RAW and JPEG images to be imported at the same time, simply separate them into separate folders in the Finder (drag the .jpg versions into a sub-folder, for example) before importing them into Aperture.

Viewing and Working with JPEG Masters

Under normal circumstances, you will only see the RAW master of each image in the Aperture browser, and all adjustments will be applied to the RAW images. If you would like to work with the JPEG master, highlight the image and choose **Images > New Version from Master JPEG**. Note that if the image you select has no associated JPEG master, this menu item will be dimmed.

The RAW and JPEG images are treated as a single master

In a RAW+JPEG workflow, the two images are treated as a single master. If you have imported the images as referenced, avoid deleting either the RAW or JPEG from the Finder - Aperture will lose connection with the remaining master as well.

What is Lights Out Management?

This article has been archived and is no longer updated by Apple.

Lights Out Management (LOM) is Apple's implementation of the remote monitoring and management protocol Intelligent Platform Management Interface (IPMI) developed by Intel.

The addition of Lights Out Management to Xserve provides for the monitoring of over 100 sensors that measure voltage, temperature, fan speeds, etc. Using Server Monitor, one can get a fairly complete picture of the health of an Xserve.

In addition to monitoring LOM can also be used to control some functions of an Xserve. Xserve can be shutdown or restarted from a remote location via the implementation of LOM in Server Monitor. Even if the Xserve is in an unresponsive state, one should be able to gain access via LOM.

The LOM process is controlled by a dedicated processor. This processor works independently of the two Xeon processors in the Xserve, leaving them to focus on server tasks.

The LOM processor is accessed through one or both of the built-in Ethernet ports. Each built-in Ethernet port has two MAC addresses assigned: One is dedicated to the LOM processor, the other is used by Mac OS X Server. This means there are two MAC addresses accessible by Mac OS X Server, and two dedicated to the LOM processor.

During the setup process, IP addresses are assigned to one and/or both MAC addresses reserved for the LOM processor. These IP addresses used by the server and the IP addresses used by the LOM processor must be different. Additionally, an account is created to access the LOM processor. This account is used to access LOM features and data but is not used in any other part of the system.

To manage LOM access (IP addresses and account information), use Server Monitor. This is the only location, outside of the setup assistant, where this information can be accessed. The LOM account will not show up in Workgroup Manager, nor will the LOM interface be visible in System Preferences. For more information on managing LOM access, see Server Monitor Help.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Xserve: Do not use 2-byte characters in Lights Out Management (LOM) account name

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Xserve (Late 2006) LOM processor does not support 2-byte characters in its user account name. 2-byte characters are commonly used in Japanese, Chinese, and Korean fonts.

Solution

Do not use 2-byte Japanese, Chinese, or Korean language characters or input methods when setting up or changing the LOM user account.

For more information on LOM user account settings, consult Server Monitor Help.

Final Cut Pro: Cancelling render may change the render state of audio tracks

This article has been archived and is no longer updated by Apple.

Issue

In some cases, if you cancel a render operation that involves audio tracks, a portion of audio content which previously was rendered, may afterwards be unrendered.

Workaround

This behavior is simple to work around; just render the audio again. Audio content will render in Final Cut Pro in a fraction of the time it takes to render video.

Follow these steps to render audio items in the Timeline:

1. Select the audio clips that need rendering.
2. Choose **Sequence > Render Selection > Audio**

This document will be updated as more information becomes available.

About Xserve RAID Admin Tools 1.5.1

This article has been archived and is no longer updated by Apple.

Xserve RAID Admin Tools Software Release v1.5.1

Installation instructions

The following new items are in this release:

- RAID Admin v1.5.1
- firmware-1.5.1-1.51.xfb
- READ ME FIRST Folder

If you installed this software via the Software Update mechanism, all of the above items will be installed in a new folder "Xserve RAID Update", located in the Applications/Utilities folder. If you are installing from CD, drag all items to your preferred location on your host computer's hard disk.

The versions of RAID Admin and Xserve RAID firmware in this release should replace all earlier versions.

Support for 750 GB drive modules

This release provides support for the new 750 GB Xserve RAID drive modules offering a massive 10.5 TB of combined capacity. Xserve RAID systems MUST be updated with this release in order to utilize these new drive modules. Systems with older firmware will not be able to recognize the new drive modules, therefore it is recommended that all systems be updated prior to installing new modules. See the "Xserve RAID firmware update instructions" section at the end of this document for more details on performing this update. Always backup all data on the Xserve RAID before applying any updates.

What's New in this Release

- Support for 750 GB Xserve RAID drive modules.
- Changes to Host Cache Flushing performance setting are properly saved on RAID controller.
- Fixes SCSI protocol compatibility issues with Microsoft Windows.
- Addresses an encoding issue--passwords may now contain any valid Unicode character.
- Automatically updates the current session password after password is changed in system settings.
- "IDE Error" event log message details are now correctly displayed in hexadecimal.
- Removes LUN Masking from Advanced panel.
- Closes an unused TCP/IP port (192) on the Controller Module.

Xserve RAID firmware update instructions

This release includes the latest version of firmware for your Xserve RAID. Use the RAID Admin application to upgrade any Xserve RAID system that requires new firmware. You can check the current version of firmware on an Xserve RAID by looking at the Firmware Version field in the Components monitoring tab in RAID Admin. Select a system in the monitoring list, click the Components tab, and select the upper or lower controller module in the display.

Important: Before updating the firmware, you should have all Xserve RAID volumes unmounted from all host systems to prevent possible data loss. The firmware update process will cause an automatic restart of the Xserve RAID that will interrupt data availability. The new firmware will not disturb your existing RAID sets or enclosure settings including password, system name, and email notifications. Always backup all data on the Xserve RAID before applying any updates.

Before updating new firmware, RAID Admin will disable the disk and RAID controller caches. This is done to prevent stale data in the controller's memory from being used in the new firmware. Note: Do not quit RAID Admin while the firmware update process is taking place. Original cache settings will be restored by RAID Admin at the end of the firmware update process.

To update the firmware:

1. Open RAID Admin and choose an Xserve RAID system in the monitoring list.
2. From the **System** menu, choose **Update Firmware**, then select the "firmware-1.5.1-1.51.xfb" file.

RAID Admin will determine whether your Xserve RAID system's firmware needs updating and proceed with the update when you select the Update button. Both the management coprocessor's and RAID controller's firmware will be updated on the upper and lower controller modules. The firmware update will require several minutes to complete. Do not interrupt this operation until it is done. The Xserve RAID will restart when the firmware update is complete in order for the new firmware to take effect. Verify the new firmware versions by looking in the Components tab

after the Xserve RAID has restarted.

Procedure for adding and moving drives and arrays

Xserve RAID Admin update 1.5 and later implements a new procedure regarding how hard drives are added to an Xserve RAID and how RAID arrays are moved from one Xserve RAID to another. The new procedure adds a measure of safety to prevent inadvertently changing drives from a RAID set into Spares.

If an inserted drive is determined to be part of a RAID set, the drive will be flagged with a solid amber LED and marked with an "Unavailable" status. Before the drive can be used as a Spare or in creating a RAID set, the user must use the "Make Drive Available For Use" function, under Utilities in the toolbar.

When an entire RAID array is moved from one Xserve RAID to another, the RAID array may not be recognized due to internal conflicts with a RAID array already in the unit. To resolve these conflicts and bring the inserted array online, use the Recognize Array function, under Utilities in the toolbar.

Procedure for Replacing a Controller Module

Before replacing a Controller module, upgrade to the latest Xserve RAID firmware. To upgrade the firmware on an Xserve RAID, follow the instructions in the "Xserve RAID firmware update instructions" section. Whenever upgrading firmware or replacing a Controller module, be sure to stop all host activity to the RAID, unmount any RAID volumes from all hosts, and perform a full backup of all data.

After installing a new Controller module and making sure the Xserve RAID is fully ready with all LEDs green, it may be necessary to upgrade the firmware on the new module so both Controller modules have the same firmware versions. Finally, synchronize the settings on the new Controller module with the other module by holding down the System Identifier button and momentarily pressing the reset button on the back of the new Controller module (using a paperclip or small screwdriver). Settings synchronized are: System Name, Location, Contact settings, Monitoring and Management Passwords, Email notification list and server, audible alert, power failure, and SNMP settings.

Final Cut Studio: Best practices when naming projects and assets

This article has been archived and is no longer updated by Apple.

Discussion

This document discusses general guidelines for naming Final Cut Studio projects and related media assets. It's important to be aware that certain characters can be interpreted as functions, wildcards or path designators, and their use should be avoided when naming drives, folders, assets or projects.

Outside of Final Cut Studio, other applications may also reserve certain characters as functional, and their use in file or path names may produce unexpected results.

Tried and true

In audio, video and multimedia workflows on Mac OS X, Microsoft Windows, and most Linux distributions, the vast majority of applications will work ideally with files and paths named with characters limited to the following set:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
a b c d e f g h i j k l m n o p q r s t u v w x y z
1 2 3 4 5 6 7 8 9 0
- _ (These last two are often called "minus," and "underscore".)

Best to Avoid

The following list of characters may cause issues if used in file or path names. In many cases these characters are OK to use, or the operating system will prevent you from using them in file or path names. But it's still a good general rule of thumb to avoid these if you plan on using the named file in a workflow that includes multiple applications, people, operating systems, or file systems. Issues may range from unexpected behaviors in applications, to applications or systems failing to recognize files and folders:

/ \ * & @ # $ % ? < > : ; ( )

All the rest:

Characters not listed in the two lists above will generally work OK in most cases on Mac OS X. Keep in mind, this article isn't intended to address any specific issues or surefire solutions. Rather, these are general guidelines, intended for robust results in complicated workflows. If you're creating a file or a project that you intend to send to people who are using other applications, or are using other operating systems, or, if you're not sure of what your workflow will be, using file names comprised of characters in the **Tried and true** set will produce the most robust results.

iMovie HD 6: Red tint on imported photos

This article has been archived and is no longer updated by Apple.

Issue or symptom

After importing a photo into your iMovie project, the photo may appear to have a red cast or pink tint.

Solution

Check to see if the photo file is in the BMP format. If so, convert the photo to JPEG or TIFF before adding it to your project. You can convert the photo by exporting it from iPhoto or Preview and selecting the new file format when saving.

Final Cut Pro: Capturing audio and video to separate files not available with HDV

This article has been archived and is no longer updated by Apple.

In most cases, Final Cut Pro allows you to capture audio and video either together, as one file, or as separate audio and video files.

Capturing HDV is an exception. Even if you have selected the "Capture Audio and Video to Separate Files" option in Capture Settings, HDV clips will each be written to a single file in the Capture Scratch destination, and will contain both audio and video.

This document will be updated as more information becomes available.

Migration Assistant (Japanese): Kotoeri Input Method not available on Mac OS X registration page after transferring data

This article has been archived and is no longer updated by Apple.

Issue or symptom

After finishing data transfer from another Mac, Migration Assistant doesn't allow you to use the Kotoeri keyboard input method for Mac OS X registration. This may occur even if Command-Space is pressed or the Kana key is pressed.

Solution

Quit by pressing Command-Q. To complete the registration, double click the "User Registration" icon in your Home (Kotoeri input will be available).

This document will be updated as more information becomes available.

Mac OS X 10.4: Getting help using input methods

This article has been archived and is no longer updated by Apple.

If you are looking for documentation on using one of the input methods included with Mac OS X 10.4, follow these steps:

1. Select the input method you wish to use, by following the steps listed here.
2. Click the Input Menu (a flag or input method icon) on the menu bar and select the Help for the input method you are using:
    - Kotoeri Help
    - Hangul Input Method Help
    - Simplified Chinese Input Method Help
    - Traditional Chinese Input Method Help

NOTE: The documentation is written in the language the input method is designed for and is not localized (translated) into the language currently in use by Mac OS X.

About Security Update 2006-008

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2006-008, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2006-008

- **QuickTime for Java, Quartz Composer**

  CVE-ID: CVE-2006-5681

  Available for: Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Visiting a malicious web site may lead to information disclosure

  Description: Java applets may use QuickTime for Java to obtain the images rendered on screen by embedded QuickTime objects and upload them to the originating web site. When this facility is used in conjunction with Quartz Composer, it becomes possible to capture images that may contain local information. This update addresses the issue by disallowing Quartz Composer compositions in unsigned Java applets. Quartz Composer compositions continue to function locally. Applications and signed Java applets that utilize QuickTime and QuickTime for Java are unaffected. This issue does not affect systems prior to Mac OS X v10.4. It also does not affect the Windows platform. Credit to Geoff Beier for reporting this issue.

DVD Studio Pro: Format to DLT drive does not complete on Mac Pro

This article has been archived and is no longer updated by Apple.

Issue

DVD Studio Pro allows you to format a DVD project to a DLT drive. DLT drives are typically connected to your computer with a SCSI card.

If you attempt to format a DLT drive on a Mac Pro, the write may not be successful. If this occurs, the progress bar window will report "Writing lead in data" but will not progress any further and the write will need to be cancelled.

Solution

As a workaround, inquire with your replicator about alternative delivery methods such as external hard drive or recordable DVD.

This document will be updated as more information becomes available.

Published Date: Oct 8, 2016

Mac OS 8: QuickTime Movies Won‘t Play From ISO-9660 CDs

Since I upgraded to Mac OS 8.0 (or 8.1), my computer crashes when I try to play QuickTime movies from an ISO-9660 CD-ROM.
This article has been archived and is no longer updated by Apple.
Using Mac OS 8.0 or Mac OS 8.1 with QuickTime 2.5 installed, QuickTime movies may not play back correctly or may cause the computer to stop responding when played from an ISO-9660 CD. If the movies are dragged to the hard drive first, they work correctly.

If the movies are played from a standard Macintosh format CD, they work correctly. Using system software 7.6.1 or earlier, the problem doesn't occur.

This issue was fixed in QuickTime 3. The latest version of QuickTime can be downloaded from Apple's web site:
http://www.apple.com/quicktime/

Mac OS X 10.4: Burn folders containing items on an NTFS volumes may not burn

This article has been archived and is no longer updated by Apple.

Burn folders can contain items where the original data resides on an NTFS-formatted volume. When you try to burn a CD and/or DVD with data from an NTFS volume, the burn process may not be completed and the CD or DVD may be left untouched.

NTFS is a read-only disk format for Mac OS X 10.4 Tiger. As a workaround you can copy the data from the NTFS volume to an HFS+ volume, then use the copied data as the source files for the burn folder. You will then be able to burn to a CD or DVD.

This document will be updated as more information becomes available.

Aperture: Chroma Blur and Sharpening adjustments and Auto Noise Compensation option not available with some RAW images

This article has been archived and is no longer updated by Apple.

Issue or symptom

With some RAW images, the Chroma Blur and Sharpening adjustment controls are dimmed or the Auto Noise Compensation option is not available.

Solution

The RAW decoding available in Aperture 1.1 or later offers control of Chroma Blur and Sharpening and Auto Noise Compensation.

Some camera RAW formats do not support these particular adjustments. In these cases the Chroma Blur and Sharpening controls and the Auto Noise Compensation will be dimmed.

Xsan Tuner incorrectly reports volume is mounted read-only

This article has been archived and is no longer updated by Apple.

Issue or symptom

Attempting to run Xsan Tuner from different workstations as users with differing UIDs may result in Xsan Tuner reporting that the volume is mounted read-only on one of the workstations.

Solution

Use Get Info in the Finder to change the permissions of the Xsan Tuner folder (at the root level of the volume) to allow read-write access for either Group or Others. Xsan Tuner will then be able to simultaneously write to the Xsan Tuner folder as different users from different workstations.

Additional information

Xsan Tuner creates a folder at the root of an Xsan volume named Xsan Tuner. It writes data to this folder and then measures performance statistics about the writing of the data or of reading it. The default permissions on the Xsan Tuner folder allow only the first user account that used Xsan Tuner to write data to the folder, and other users receive the inaccurate read-only message.

Power Macintosh G3: Apple Basic Color Monitor

I have an Apple Basic Color Monitor and a Macintosh G3, yet I cannot seem to get the monitor to sync to the G3 using the VGA adapter that came with the monitor while connected to built-in video.
This article has been archived and is no longer updated by Apple.
You will need an adapter placed between the VGA-Mac adapter and the computer that adds a horizontal and vertical sync signal.

The most common mistake when using an inline adapter with a VGA-based display such as the Basic Color Monitor on a G3 is to set the adapter to VGA/SVGA. If you already have an inline adapter that converts the pinouts from VGA to DB15 (which in the case of the Basic Color Monitor you would), then the second inline adapter would only need to be set to provide the two separate sync signals. The rest of the adapter should be set to an open state. Most VGA to DB15 adapters do not provide the additional horizontal and vertical sync signals and that is why the second adapter is needed.

In some instances you will also need to initially reset the PRAM on the Macintosh G3 after the adapters have been set correctly to establish the proper sync signal.

Using JBoss application server in Safari with Mac OS X 10.4.5 or later

This article has been archived and is no longer updated by Apple.

Issue or symptom

The JBoss Management Console may not work in Safari with Mac OS X 10.4.5 or later and Java 1.5. This article explains how to revert to version 1.4.2 of the Java plug-in to resolve the issue.

Solution

- Make sure that Java is enabled in Safari: Open Safari Preferences and click Security. "Enable Java" should be selected.
- Quit Safari.
- In the Finder, navigate to (/Applications/Utilities/Java/J2SE 5.0). You can do this by selecting **Go to Folder** from the **Go** menu, then going to /Applications/Utilities/Java/J2SE 5.0.

  Note: If this folder is not present, then you don't have Java 1.5 installed.

- Double-click Java Preferences. In the General tab, select "Use version J2SE 1.4.2".
- Click Save, then quit Java Preferences.
- Open Safari and load the JBoss Management console at (https://localhost:40000).

Additional information

To configure and start the JBoss Management console, please see Administering Application Servers.

Final Cut Pro: Insert Edit/Assemble Edit unavailable in Edit to Tape window

This article has been archived and is no longer updated by Apple.

The Edit to Tape features in Final Cut Pro require precise device control in order to accurately start and stop recording at the desired timecode locations on tape. If the Insert Edit or Assemble Edit buttons in the Edit to Tape window are not available (don't respond to clicking), you may need to modify the settings on your video recorder. Most professional video decks feature on-screen menus which allow a number of the device's settings to be displayed and changed.

For details about the capabilities of your video equipment, check the documentation that came with it. For more information about equipment requirements for using Edit to Tape features, refer to the Final Cut Pro User Manual.

Published Date: Feb 20, 2012

Final Cut Express: Capture Project feature is not available with HDV projects

This article has been archived and is no longer updated by Apple.

The Capture Project feature in Final Cut Express HD allows you to capture or recapture all the clips in a given project. In order to accurately capture the desired clips, this feature depends on reliable timecode on the source tape. Because many HDV camcorders and decks do not record timecode, this feature is unavailable if you are working in a project that uses the HDV-Apple Intermediate Codec setting.

Logic: CoreAudio System Overload Messages

This article has been archived and is no longer updated by Apple.

When you work with Logic, you may occasionally see this error message:

> **System Overload. The audio engine was not able to process all required data in time.**

The following is a discussion of what this message means, and some strategies to help avoid it.

When you work with audio in Logic, several areas of your computer are put to work. When Logic records and plays back audio tracks CPU power and hard disk I/O capacity is needed. Audio DSP effects and software instruments require CPU power and RAM. No computer has infinite capacity in any of these areas, and there may be times when a Logic project will require more power than your computer is able to deliver at a given moment. When this happens, the System Overload message appears. This dialog is not generally an indication that anything is wrong with Logic or your computer, but is rather an indication that there not enough CPU power, RAM, or hard disk bandwidth to do what the song is asking at the time. You can get an idea of how much of your computer's capacity is in use by looking at the System Performance window. You can access it by choosing **Options > Audio > System Performance**.

The window has two meters. The *Audio* meter shows the amount of CPU and RAM capacity used. On multi CPU/core computers, it will be subdivided to show performance for each CPU/core. The *Disk I/O* meter shows the amount of disk bandwidth used. Watch the meters as the song plays to get an idea of what area may be running short of resources.

System Configuration

The first step in preventing System Overload error messages is to make sure your computer is optimally configured.

- Quit other applications when running Logic. In most cases, open applications that you are not actively using will have little impact on your computer. However, it is possible for other open applications to use enough computer resources to cause overload error messages in Logic.
- Make sure your computer has plenty of RAM. Many DSP effects are heavily RAM dependent. Extensive use of the EXS24 also may require a lot of RAM.
- Be sure that any drive you use to record audio is formatted *Mac OS Extended (Journaled)*. Avoid using UNIX formatting, and don't record to drives formatted FAT32. Use a disk maintenance utility to regularly check and repair your drives' directory structure and to make sure that your files are not fragmented.
- If your projects typically involve many audio tracks, consider a dedicated hard drive for audio. If your computer supports multiple internal drives, then an additional internal 7200 RPM drive would be a good choice. If your computer does not have space for an extra drive, then a FireWire drive may be a good option. Many portable computers have 5400 or even 4200 RPM internal drives, so using a faster FireWire drive may improve audio track performance considerably. Again, look for a 7200 RPM drive.
- If you work with a lot of EXS24 instances in a typical project, then a dedicated drive for sample storage may be worth considering, especially if you use the *Virtual Memory* option in the EXS24 (see below under **Workflow Strategies**).

Audio Drivers Preferences

There are several adjustments that can be made in the Audio Drivers window.

- The Input Buffer is like a bucket that must be filled with incoming audio data before it is passed through to the CPU, and the Output Buffer is like a bucket that must be filled with processed audio data before it is passed through to the outputs. The *I/O Buffer Size* setting controls the size of these buckets. The lower this setting, the less latency between the time you play something into Logic and the time you hear it. The trade-off is that lower buffer settings increase the load on the CPU. Increasing the I/O Buffer Size may prevent System Overload error messages. However, the increased latency may be an issue when recording. One possible strategy would be to work with a low I/O Buffer Size while tracking, and then to increase the size while mixing. The practicality of this approach depends on your workflow. For purely audio recording (not involving Audio Instruments), you may be disable the *Software Monitoring* check box and monitor your audio directly from the source. In this case, you can set the I/O Buffer Size to a large number even while recording audio.
- The *Process Buffer Range:* setting determines how large a buffer Logic sets aside for its mixing engine. As with the *I/O Buffer Size*, smaller settings decrease latency, but increase CPU load. The default setting of *Medium* is usually fine, but if you experience frequent System Overloads, then try setting it to *Large*.
- *ReWire behavior:* comes into play if you are sending MIDI to another application via ReWire. There are two settings *Playback Mode (Less CPU Load)* and *Live Mode (Higher CPU Load)*. Leave this set to *Playback Mode* unless you are playing live from Logic into another application through ReWire.

Sample Rate

The song's sample rate directly affects the CPU and hard disk load. For example, if you double the sample rate from 44.1 kHz to 88.2 kHz, you double the amount of data that must be streamed from the hard drive for each audio track to be played. The CPU also must work harder to process the audio. Don't necessarily assume that the highest sample rate your audio interface supports is the best one to use. Always balance the considerations of audio quality, anticipated delivery medium for the final product, and computer performance when selecting the sample rate for any project

Workflow Strategies

As a project progresses, it may reach a "tipping point" where System Overload messages start to appear. Here are some ideas to avoid this:

- Avoid having an Audio Instrument track selected in the Arrange. When an Audio Instrument track is highlighted, Logic must devote enough CPU resources to insure that anything you *might* play live into the track can be processed. When you are mixing, try to keep an Audio or classic MIDI track highlighted as you work. Only select an Audio Instrument track at times when you are actually working with that particular track.
- Freezing tracks can be a very effective strategy. When a track is frozen, it is rendered as a simple audio file with all DSP, and all plug-ins on the track are disabled in the background. This can save large amounts of CPU power. Keep in mind that freezing Audio Instrument tracks actually adds to the load on the hard disk, so if Disk I/O is the source of overloads, freezing these tracks may be counterproductive.
- Limit the voices used by Audio Instruments. Many of Logic's Audio Instruments offer control over the maximum number of voices available per instance of the instrument. Reducing the number of voices can reduce the CPU load. For example, if you have a Sculpture track that never plays more than two simultaneous notes, then you could reduce the number of voices to two, saving some CPU power for other

tasks.

- The EXS24 offers an option to stream samples from disk rather than load them completely into RAM. To access the controls for it, click the Options button in the upper right area of the EXS24 window and choose **Virtual Memory**.

  - The *Disk Drive Speed:* setting calibrates the performance of Virtual memory to your hard drive. On a modern desktop Mac, either *Medium* or *Fast* should be appropriate. On a portable computer with a slow (4200 RPM) disk drive, *Slow* may be the best option.
  - *Hard Disk Recording Activity:* allows you to balance the performance of the EXS24 streaming with the demands that your audio tracks may place on Disk I/O. If you use very few audio tracks, set it to *Less*. If you typically work with a large number of audio tracks, *Average* or *Extensive* may be the better choice. Whether or not to enable Virtual Memory at all is another trade-off between RAM and hard drive performance. If most of your System Overloads seem to be accompanied by peaks in the Audio meter in System Performance, then enabling Virtual Memory may help, especially if you load lots of EXS24 samples in a typical project. If the Disk I/O meter is peaking, then turning off Virtual Memory may be the better choice. Settings in the Virtual Memory window are global—they affect all instances of the EXS24 in all songs.
- Use Bus channels to share CPU intensive effects among multiple tracks. Whenever possible, avoid putting reverbs and delays on individual channels. Put them on a Bus, and send to them from each track. If a track requires a different sounding reverb than the rest of the song, try a less CPU intensive reverb like the SilverVerb or GoldVerb. If you are processing multiple tracks with the same EQ and/or compressor, insert the plug-ins on a bus and set each track you wish to process to output to that bus.
- Under **Logic Pro > Preferences > Audio > General** there's a setting for *Sample Accurate Automation* with three possible settings. The default is *Volume, Pan, Sends*, but may also be set to *Off* or *Volume, Pan, Sends, Plug-in Parameters*. The more automation parameters set to be sample accurate, the more load may potentially be placed on the CPU.

Final Cut Studio: Video out from Motion or Final Cut Pro is sometimes sporadic

This article has been archived and is no longer updated by Apple.

Issue or symptom

Video out to an external monitor may be sporadic or the image displayed on the monitor may freeze.

Solution

Video playback to an external monitor from Final Cut Pro or Motion may be sporadic if Soundtrack Pro is using the same Video Out device. Soundtrack Pro is capable of sending to an external device in the background, but this may interfere with playback from other applications. Stop playback in Soundtrack Pro before starting playback from other applications.

Final Cut Pro: Blank image may result if the end of a sequence is exported as a Photoshop image

This article has been archived and is no longer updated by Apple.

Issue

If you export a still image from the end of a Final Cut Pro sequence, it's possible for the result to be a blank white image, instead of the sequence's last frame.

Solution

Before you export the still, be sure that the playhead position is at the **beginning of the last frame**, instead of after the last frame.

In normal editing, this might be hard to see, but the following illustrations show the end of a sequence as seen at a high zoom-level in the Timeline. Note the difference in the location of the playhead in the illustrations.

The playhead in the correct position for exporting the last frame as a still image

The playhead in the wrong position for exporting the last frame as a still image

Follow these steps to reliably export the last frame as a still.

1. Click in the **Timeline**, so that it is the active window.
2. Press the **End** key on your keyboard, and the playhead will move to the end of the sequence. At this point, the playhead position is after the end of the last frame.
3. Press the **Left Arrow** key on your keyboard once to move the playhead back one frame.
4. Choose **File > Export > Using QuickTime Conversion**.
5. From the **Format** pop-up menu, choose **Still Image**.
6. Click **Save**.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

DVD Studio Pro: Some HD DVD verification warnings do not indicate an issue

This article has been archived and is no longer updated by Apple.

Issue

When you submit an HD project for replication, the replicator may use a verifier to ensure the project is compliant with the HD DVD specification. It is important for the replicator to have the latest version of the verifier to ensure that false error messages are not found in your projects.

The following warnings from the Toshiba verifier may appear in reports but do not indicate an issue and can be ignored:

- ERROR(HLI,1100): The period of two different HLI shall not overlap.
- ERROR(BTNI,1004): Start Y-coordinate value is out of range.
- ERROR(BTNI,1007): End Y-coordinate value is out of range.
- ERROR(TT_SRP,1101): TT_PB_TY1 is '1b' although Jump/Call Instruction does not exist in the cell command or "FOAC_BTNN" in TT_DOM. VI5-111.
- ERROR(TT_SRP,1121): TT_PB_TY3 is '1b' in spite of Link/Jump/Call Instruction not existing in "BTN_CMD" in TT_DOM. VI5-111.
- ERROR(EVOBU_SRI,1200): V_FWD_Exist1 of FWDI is not proper. FWDI_1/V_FWD_Exist1(0h), [LBN: 265153(File 1:265153)] VI5-353.
- ERROR(EVOB,8007): The value of EVOBU_SE_E_PTM does not suit the video field.
- ERROR(EVOB,8002): The presentation period of EVOBU is not in agreement with the video field.
- ERROR(EVOB,8004): When EVOBU contains video, presentation start time must be equal to the top video field.
- ERROR(EVOB,8004): When EVOBU contains video, presentation start time must be equal to the top video field.
- ERROR(EVOB,9002): When the presentation period of EVOBU is longer than the presentation period of the video data contained in it, there must be sequence_end_code behind the last coding screen.
- WARNING(NSML_AGLI,1000): It is impossible to get C_PBI/C_CAT because there is no PGC that uses Cell in which this EVOBU is contained, for this reason, it cannot judge whether NSML_AGLI is proper or not.
- WARNING(SML_AGLI,1001): It is impossible to get C_PBI/C_CAT because there is no PGC that uses Cell in which this EVOBU is contained, for this reason, it cannot judge whether SML_AGLI is proper or not.
- WARNING(EVOBU_SRI,1000): Since there is no PGC which uses Cell in which this EVOBU is contained and the presentation time information on EVOBU cannot be acquired, it cannot judge whether EVOBU_SRI is proper.

Note: The text of the error message may vary but the error ID can be used to determine if the error is valid or not.

Solution

These particular verification error messages are not valid and do not indicate an issue with your master.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.4.8: System Preferences unexpectedly quits after configuring iTunes Artwork screen saver

This article has been archived and is no longer updated by Apple.

Issue or symptom

System Preferences may unexpectedly quit in Mac OS X 10.4.8 after setting the iTunes Artwork screen saver to use two rows in Desktop & Screen Saver preferences. You may not be able to open System Preferences after this happens.

Solution

To avoid the issue, use any iTunes Artwork screen saver Row setting besides 2 (the default is 5).

To resolve the issue if you are affected, go to your Home folder and remove a plist file (~/Library/Preferences/ByHost/com.apple.screensaver.iTunesArtwork.xxxxxxxxxx.plist) :

1. In the Finder, choose **Home** from the **Go** menu.
2. Open the Library folder.
3. Open the Preferences folder.
4. Open the ByHost folder.
5. Locate the file named "com.apple.screensaver.iTunesArtwork.xxxxxxxxxx.plist" and remove it (the "xxxxxxxxx" is a random set of numbers).
6. Open System Preferences.

Note: Removing this file may reset other System Preferences settings. Adjust your System Preference settings as desired.

This document will be updated as more information becomes available.

AirPort Extreme (802.11n): May incorrectly appear to be powered by a connected USB device

This article has been archived and is no longer updated by Apple.

Issue or symptom

The status LED on an AirPort Extreme may be lit if certain self-powered USB devices (for example, printers, hubs, or a storage device) are connected and powered but the external power supply of the AirPort Extreme is off (unplugged from the AirPort or the wall outlet). The AirPort Extreme is not operating correctly in this state.

Solution

1. Disconnect all USB devices from the base station.
2. Turn on the AirPort Extreme base station and wait for it to start completely.
3. Reconnect the USB storage device.

Note: You should also avoid using any USB storage device that draws power from multiple USB ports (with a Y-adapter, for example). Use an external power source for the device and a regular (not Y-cable) to connect to the AirPort.

Installing Apple Remote Desktop Admin 3.0 if a later client version is already installed

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Remote Desktop 3.0 package installer will not install on a computer that has a later (newer, that is) client version installed.

Solution

1. Uninstall the later client software. See this article for detailed steps.
2. Install the admin and/or the client software using the Apple Remote Desktop 3.0 Installer.
3. After installing ARD 3.0, use Software Update to update to the latest version.

About the WebObjects DST Update (WebObjects 5.3.3)

This article has been archived and is no longer updated by Apple.

This document contains an overview and download information for the WebObjects DST Update. In March 2007, several countries will change the way they observe Daylight Saving Time (DST), including the United States and Canada. Many of the new 2007 time zone and Daylight Saving Time rules for the United States and Canada were anticipated but several other regions only recently adopted time zone and DST changes.

To address these changes, WebObjects DST is a combined update that addresses issues with the WebObjects supplied date classes using the latest DST and time zone information available as of January 8, 2007 (2007-01-08). You should install these updates even if their computer is not being used in an affected time zone.

WebObjects DST Update upgrades WebObjects components to version 5.3.3.

WebObjects DST Update is formally qualified for the Java 1.4.2 platform. The Java for Mac OS X 10.4, Release 5 updates the JDK 1.4 version on the Tiger. There are no known issues with the WebObjects DST Update on J2SE 5.0 platform on Mac OS X.

Note: AppleCare Enterprise Support customers using earlier versions of WebObjects should contact their support team for information on patch availability.

Important: If you are deploying WebObjects as .war bundles or Single Servlet Directory Deployments, you will need to rebuild with WebObjects DST Update installed and redeploy the application.

Installing WebObjects DST Update on a Developer Tools system for Mac OS X 10.4 or later

The WebObjects DST Update is available through Software Update in Mac OS X. If you have not yet updated to the correct version of Mac OS X or Developer Tools, you must do so before installing the WebObjects DST Update. Xcode 2.4.1 Developer tools are available through ADC downloads.

System requirements

- Xcode 2.4.1 (for developer systems)
- Java for Mac OS X 10.4 Release 5
- WebObjects 5.3
- Mac OS X 10.4.8 or later

If you are updating from a WebObjects 5.3.0 or WebObjects 5.3.1 development system

Install the software in the following order:

1. Run the Xcode 2.4.1 installer.
2. Select the Custom Install option.
3. Select the WebObjects install packages.
4. Use Software Update and upgrade to the latest Java 1.4 (Java for Mac OS X 10.4 Release 5 or later).
5. Run Software Update and install the WebObjects DST Update.

If you are updating from a WebObjects 5.3.2 development system

Install the software in the following order:

1. Run Software Update and upgrade to the latest Java 1.4 (Java for Mac OS X 10.4 Release 5 or later).
2. Run Software Update and install the WebObjects DST Update.

If you are creating a new Mac OS X WebObjects DST updated development system

Install the software in the following order:

1. Install Mac OS X 10.4.
2. Run Software Update and upgrade to the latest version of 10.4.
3. Run Software Update and upgrade to the latest Java 1.4 (Java for Mac OS X 10.4 Release 5).
4. Run the Xcode 2.4.1 installer.
5. Select the Custom Install option.
6. Enable the WebObjects install packages.
7. Run Software update and install the WebObjects DST Update.

Installing the WebObjects DST Update for Mac OS X 10.4 Server

TA24549_About_the_WebObjects_DST_Update_WebObjects_.pdf

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download.

System requirements

- Mac OS X Server 10.4.8 or later
- Java for Mac OS X 10.4 Release 5
- Installation of WebObjects 5.3 Server Manual Software Update
- Installation of WebObjects 5.3.1 Server Software Update

If you have not yet updated to the correct version of Mac OS X Server, you must do so before installing the WebObjects DST Update.

If you are updating a WebObjects 5.2.4 system or creating a new install on Mac OS X 10.4 Server

1. Install the WebObjects 5.3 Server Manual Software Update.
2. Install the WebObjects 5.3.1 Update through Software Update.
3. Install the WebObjects DST Update through Software Update.
4. Upgrade the current version of Java to Java for Mac OS X 10.4 Release 5.

Note: The WebObjects Server 5.3 Update is available only from Apple Downloads.

If you are updating Mac OS X WebObjects 5.3.0 deployment system

Install the software in the following order:

1. Install the WebObjects 5.3.1 Update through Software Update.
2. Install the WebObjects DST Update through Software Update.
3. Upgrade the current version of Java to Java for Mac OS X 10.4 Release 5.

If you are updating Mac OS X WebObjects 5.3.1 or 5.3.2 on Mac OS X 10.4 Server

Install the software in the following order:

1. Install the WebObjects DST Update through Software Update.
2. Upgrade the current version of Java to Java for Mac OS X 10.4 Release 5.

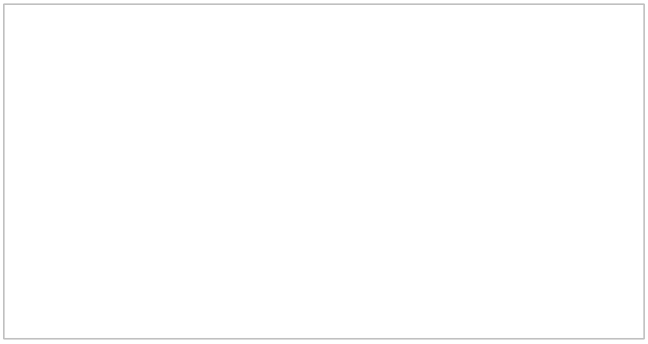
Update to iOS 12

Enjoy a faster and more responsive experience as well as fun new features, like Memoji and Camera Effects.

Get iOS 12



Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

AirPort Extreme (802.11n): USB storage devices that use removable media are not supported

This article has been archived and is no longer updated by Apple.

AirPort Extreme (802.11n) base stations, which work with USB storage devices, do not support USB devices that use removable media such as a floppy disk drive or an optical drive.

Published Date: Oct 10, 2016

AirPort Extreme (802.11n): Using an attached USB storage device as a home directory is not recommended

This article has been archived and is no longer updated by Apple.

You should not use a USB storage device connected to an AirPort Extreme (802.11n) base station as a home directory. An AirPort Extreme (802.11n) base station may not be able to locate a home directory on an attached USB device if it is powered off or if the enumeration order of attached storage devices changes.

Mac OS X 10.4 (Japanese): Spotlight search field unexpectedly opens with Command-Space key combination

This article has been archived and is no longer updated by Apple.

Issue or symptom

In the Japanese language version of Mac OS X 10.4, the Command-Space key combination should switch the Kotoeri input source. However, after some installations of Mac OS X 10.4, the Command-Space key combination may open Spotlight instead of switching the input source.

Solution

Follow these steps to restore the Mac OS X 10.4 Tiger (Japanese language version) default keyboard shortcuts (which are: Command-Space to select the previous input source, and Control-Space to open Spotlight's search field).

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Keyboard & Mouse**.
3. Click Keyboard Shortcuts.
4. Click the Restore Defaults button.
5. Close System Preferences.

Additional information

This may occur when if you upgrade from Mac OS X 10.2.8 to Mac OS X 10.4 via an Archive and Install installation. Or, this may occur when you transfer data from Mac OS X 10.2.8 or earlier using Mac OS X 10.4's Migration Assistant.

Power Macintosh G3 All-in-one: Connecting An External Monitor

The Power Macintosh G3 All-In-One comes with a Built-In monitor capable of handling resolutions up to 1024 x 768. An external monitor can also be connected to the built-in monitor port located in the back of the computer. This port supports resolutions up to 1920 x 1080.
This article has been archived and is no longer updated by Apple.
The Built-in monitor and the second monitor connected to the Built-in monitor port must share the same mode. (Mode is a combination of resolution and screen refresh rates.)

Depending on the type of monitor you connect, you may need to change the built-in monitor's setting to one that both monitors can display. To change the monitor mode, use the Monitors and Sound control panel or the Control Strip.

Also, the external monitor you connect may support modes that the built-in monitor does not. If you select one of these modes for the second monitor, the built-in monitor powers down and appears to be turned off. Video will only be displayed on the external monitor. If this occurs, you can restore the image to the built-in monitor by selecting a mode that both monitors support.

When the built-in monitor starts up again, its screen image wavers for a moment. This is part of the normal process that protects the monitor from damage.

Note: Since the Built-In video port is only capable of mirroring the Built-In monitor, it cannot be used to expand desktop display space. A PCI video card must be installed, and an external monitor connected to it to expand desktop space. Also, due to the external monitor's video mode limitations, the external monitor may not be able to support the 1920 x 1080 mode.

In addition, the external built-in video port is not a separate graphics port like on the Power Macintosh G3 Minitower and Desktop models. The Power Macintosh G3 AIO only has one graphics controller, it drives both the internal and external displays and is meant for video mirroring, therefore, there are some limitations on the video modes supported for external monitors.

AppleCare Direct Mail-In Repair Service

This article has been archived and is no longer updated by Apple.

Important Customer Information

SERVICE AND ESTIMATE

Apple offers service on your product under the following conditions. If the service is not under warranty or an Apple extended service contract, Apple will service the product for the estimate provided to you when you arranged service. The estimated cost is contained on the shipping label attached to this packaging. The estimate is valid for thirty (30) days from the date on the label. If Apple does not receive your product within thirty (30) days you will need to contact Apple again to arrange service. If after inspecting your product Apple determines that the estimate must be revised, Apple will contact you for approval of the revised estimate. If you have any questions about the estimate please contact Apple at the telephone number below.

Note: You are entitled to a written estimate of the cost of repairs. The estimate must include all costs for parts and labor. Apple will not charge for work done or parts supplied in excess of the estimate unless you, the customer, approve the additional charge. This estimate of repair charges is valid for 30 days from the date of estimate. You must notify Apple if you claim a tax exemption and provide Apple with a tax exemption number at the time you receive this estimate. The cost of shipping is included in the estimate.

TERMS OF SERVICE

General

If the repair is covered under warranty or an Apple extended service contract, the terms of the warranty or the Apple extended service contract shall apply. Otherwise, the Repair Terms and Conditions shall apply to the repair service.

Warranty and Extended Service Contract Coverage Exceptions

Although a product may be covered under warranty or an extended service contract, Apple will not be obligated to repair or replace a product if the product or the product failure is subject to a coverage exception described in the warranty or the extended service contract. Coverage exceptions include: damage caused by accident, abuse, misuse, or misapplication; substantial modification of the product without the written permission of Apple; or the removal or defacing of the product's serial number. If the repair is not eligible under warranty or an extended service agreement due to a coverage exception, Apple will contact you to determine if you want Apple to repair the product for the price that Apple estimates.

SERVICE WARRANTY

Apple provides a 90-day warranty on repair service. This means that if within 90 days of service, a defect arises in the service parts used, Apple will service your product again at no charge. You may have longer warranty coverage if your product is still covered under its original warranty or an extended service contract. Please review the terms of your warranty, extended service contract, or the Repair Terms and Conditions for details.

DIAGNOSTIC FEE

If the product repair is not covered under warranty or an extended service contract Apple reserves the right to charge up to $100 USD for diagnostic services performed on your product, if (i) service is not required, (ii) service requires the repair of a third-party part or product, (iii) service is declined by you after Apple has revised its estimate due to service being excluded from warranty or Apple extended service contract coverage, or (iv) service is declined by you after Apple has revised its estimate due to service requiring additional parts or labor.

EXCLUSIONS OF SERVICE (does not apply to Displays)

Hard Disk Data

During the course of a repair, it is possible that software or data on your hard disk may be erased. Apple cannot overemphasize the importance of backing up your hard disk before sending your product to Apple for service.

IMPORTANT: Apple disclaims responsibility for all loss, corruption, or damage to software applications, data, or any information stored in any product given to Apple for service.

When sending in an Apple portable product for repair, make sure to check that the computer has at least 3 GB of free space on the hard disk. The repair center requires at least 3 GB of free disk space to install and run diagnostic software for these computer models.

iTunes Music De-authorization

Because some repairs may affect or delete a computer's authorization to play music or videos purchased from the iTunes Music Store, you must always de-authorize your product before shipping it to Apple for service. Information on authorization and de-authorization is available from the iTunes Help menu. If you need to recover any authorization lost during service, contact iTunes Music Store Customer Service via the iTunes Help menu.

Security Software De-authorization

You must disable all security software installed on your product when given to Apple for service. Products received with systems that are password-protected will either be returned un-repaired, or the repair will be delayed. If you did not provide the necessary passwords when the repair was set up, or if you need assistance disabling the security software, contact Apple at the number below.

Third-Party Products

Apple will not repair third-party (non-Apple branded) products (such as modems, RAM cards, hard disks) installed in your product. If Apple receives a product that has an issue with a third-party product, the product will be returned with an explanation that the defective component is not an Apple product.

SHIPPING PRODUCTS TO APPLE

You may check the status of your repair request online at www.apple.com/support/selfservice/status. If your request is open, you may send your product to Apple for repair using the original dispatch number. If Apple has canceled, call Apple to create a new repair request. Using a canceled dispatch number will cause service delays.

IMPORTANT: Requests for service are good for 30 days. If Apple has not received your product within 30 days of your original request for service, Apple may cancel its offer to repair.

Lost or Damaged Items

If your product is lost or damaged in transit to the AppleCare Repair Center, contact Apple immediately. Apple will investigate and file a claim on your behalf with the appropriate carrier. Apple is not responsible for any liability for damage or loss to your product while in transit.

REPAIR STATUS AVAILABLE ONLINE

Repair status for your product is available online by going to www.apple.com/support/selfservice/status. If you have questions about a specific product repair, you may also contact Apple at 800-APL-CARE (800-275-2273) seven days a week from 6 a.m. to 6 p.m. (Pacific time).

TECHNICAL ASSISTANCE

Many questions concerning your product can be answered at www.apple.com/support. If you require technical assistance you may also contact Apple at 800-APL-CARE (800-275-2273) seven days a week from 6 a.m. to 6 p.m. (Pacific time).

Customer Shipping Preparation for Portables

This article has been archived and is no longer updated by Apple.

AppleCare Direct Mail-In Repair Service

Before you mail anything to Apple, please be aware of Apple's repair terms and conditions.

Step 1 - Back up your data
Step 2 - De-authorize iTunes
Step 3 - De-authorize security software
Step 4 - Disclose coverage exceptions
Step 5 - Package the product
Step 6 - Ship out the product

Step 1 – Back Up Your Data

Apple cannot over-emphasize the importance of backing up hard disk data before sending a product to Apple for repair. During the course of the repair, it is possible that software or data on the hard disk may be erased.

- Read the disclaimer in AppleCare's Direct Mail-in Repair Service Information concerning the integrity of hard disk data.
- When sending in an Apple portable product for repair, make sure to check that the computer has at least 3 GB of free space on the hard disk. The repair center requires at least 3 GB of free disk space to install and run diagnostic software for these products. Follow the steps below to check for available hard disk space:
  1. Click once on the hard disk icon on your desktop to highlight it.
  2. From the File menu, choose Get Info.
  3. The resulting window indicates how much hard disk space is available.

Step 2 - iTunes Music De-authorization

Some repairs may affect or delete a computer's authorization to play music or videos purchased from the iTunes Store. Customers should always back up computer data, including iTunes music and videos, and de-authorize the computer prior to a repair. To recover any authorization lost during a repair, customers can contact iTunes Store Customer Service via the iTunes Help menu.

Step 3 - Security Software De-authorization

Please disable security software installed on your Apple product. Products received with systems that are password-protected will either be returned un-repaired, or the repair will be delayed.

- If you did not provide the necessary passwords when the repair request was set up, or if you need assistance disabling the security software, contact Apple Dispatch at 800-APL-CARE (800-275-2273) before sending in the product.

Step 4 - Coverage Exceptions Disclosure

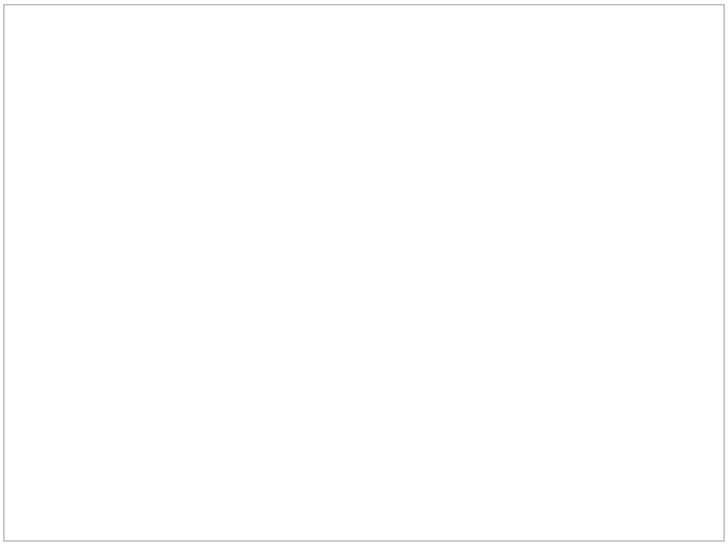
To prevent any delays in the repair process, be sure to disclose any coverage exceptions such as damage caused by accident, abuse, misuse, or misapplication; substantial modification of the product without the written permission of Apple; or the removal or defacing of the product’s serial number.

Step 5 - Packaging

- Follow the illustrated packaging instructions enclosed with the Apple product box.
- Pack only the Apple computer in the box provided.
- Do not include the AC adapter, power cord, extra batteries, pc cards, manuals or any software discs unless specifically instructed by an

Apple representative.

- Make sure any CD or DVD discs have been removed from the optical drive.
- Any installed RAM, airport card, hard drive and battery should remain installed.



Step 6 - Shipping instructions

1. **EZ Return Label**
   Remove the top shipping label from your shipping box, beginning at the area highlighted in yellow that states "EZ RETURN LABEL -LIFT HERE." Make sure that the bottom label remains attached to the shipping box. It is your return shipping label.
2. **Verify Information**
   On the bottom label that remains with the shipping box, please verify that the product serial number and dispatch numbers are correct and clearly visible.
3. **Your Copy**
   Retain the customer copy of the airbill for your records. Use the airbill number/tracking number from the return shipping label to track your shipment. Your invoice estimate is on the back of the removed top shipping label (see step 1). Customers who are responsible for any type of repair fee will receive an actual invoice separately in the mail five to seven business days after the completed repair.
4. **Ship via FedEx**
   Bring the boxed and sealed product to a FedEx location, or contact FedEx at 800-GO-FEDEX (800-463-3339) to arrange a pickup. Be sure to give the package to a FedEX representative. Do not leave the package in a FedEx drop box.

Terms and Conditions

If you have any other concerns or questions, you can further review Apple's complete Repair terms and conditions here.

AirPort Extreme (802.11n): TSN/WPA Windows clients may have connectivity issues

This article has been archived and is no longer updated by Apple.

Some Windows clients may not be able to properly implement the Transitional Security Networks (TSN) version of WPA. TSN provides access for both WPA capable clients as well as WEP only clients. If a Windows client has issues connecting to an AirPort Extreme (802.11n), try using TSN/WEP instead.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About Xsan 1.4.2

This article has been archived and is no longer updated by Apple.

There are two updates for Xsan 1.4.2: "Xsan 1.4.2 Update" and "Xsan Admin 1.4.2 Update". These are available from both Apple Support Downloads and Software Update.

Important: Read before continuing

Before installation

- Xsan 1.1 or later is required in order to install Xsan 1.4.2.
- If you are setting up a new Xsan deployment, please see this article for the proper installation order.
- Be sure that all Metadata Controllers (MDCs) are updated before you make any configuration changes.
- Before installing, please review the Xsan Migration Guide.
- During installation, do not change any Xsan settings using Xsan Admin or a command-line tool.
- If upgrading system software to Mac OS X 10.5 Leopard, upgrade all Xsan 1.4.x systems to 1.4.2 before upgrading to Leopard.

After Installation

To prevent an inconsistent volume state, you should unmount, stop, and run the `cvfsck` command on each Xsan volume after the MDCs have been updated with Xsan 1.4.2 Update.

Metadata Controller (MDC) software version

Your MDCs must always have software versions (both Xsan and Mac OS) that are the same or more recent than the most recent client versions. Specifically, if any client in your Xsan network is using Xsan 1.4.2 with Mac OS X 10.4.10 or later, then your metadata controllers (MDCs) must also be updated to Xsan 1.4.2 on the same version of Mac OS X.

Software Update installation

Software Update may have referred you to this document. Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone installer

A standalone installer is available from Apple Support Downloads.

Remote installation

If you need to install the update on a remote computer, use the `softwareupdate` command-line tool.

Hardware requirements

- Xserve or Xserve G5
- Mac Pro
- Power Mac G5 (any)
- Storage Network Requirements
- Apple Fibre Channel PCI, PCI-X, or PCI-E Card

Compatibility matrix

See Xsan: Compatibility of SAN clients with Xsan and StorNext controllers.

What's new in Xsan 1.4.2

The Xsan 1.4.2 update addresses numerous issues related to overall reliability, usability and compatibility. It includes specific fixes for:

- Mounting Fibre Channel LUNs on Mac OS X Leopard
- Metadata controller failovers during power outages and network disconnects
- Memory-related issues that could result in slow system performance or non-responsiveness
- Reducing fragmentation of large files and frame drops during ingest
- Preventing file system metadata corruption
- Hosting Xsan volumes on Intel-based metadata controllers
- Defragmenting files after a volume bandwidth expansion

- Compatibility with Apple and third-party applications

Uninstalling

The Xsan 1.4.2 Uninstaller removes Xsan, the Xsan Admin application, and Xsan documentation files. The Xsan 1.4.2 Uninstaller is appropriate version to use when uninstalling Xsan 1.4.x installations and can be obtained from Apple Support Downloads.

Note: Before removing Xsan, you should back up all of your data and volumes.

Xsan 1.4 documentation

Xsan 1.4.x administrators can find Xsan 1.4 documentation here.

AirPort Extreme (802.11n): USB volume does not appear in Airport Disk Utility, or appears with an unexpected name

This article has been archived and is no longer updated by Apple.

Issue or symptom

A USB storage device connected to an AirPort Extreme (802.11n) base station may not appear in AirPort Disk Utility, or may not appear with the expected name. This can happen if the device's volume is named with high ASCII characters or 2-byte characters.

Solution

Disconnect the volume, connect it to a computer, and rename the storage volume so it has no high ASCII or 2-byte characters. Then, reconnect it to the base station.

Additional information

Two-byte characters are commonly used in Japanese, Chinese, and Korean fonts. High ASCII characters are "extended ASCII" characters that you typically type using the Option key. They are listed in table II of this webpage: (http://www.cdrummond.qc.ca/cegep/informat/Professeurs/Alain/files/ascii.htm).

Aperture: How to burn images to optical media

This article has been archived and is no longer updated by Apple.

Although Aperture does not offer a direct way to burn images to optical media (CD, DVD, etc.), you can combine the various export features Aperture offers with the disc burning capabilities of OS X to accommodate many workflows. Here are some tips:

CD & DVD Preferences

When you insert a blank optical disc, there are several actions that your system may take, depending on your System Preferences settings. These procedures assume that you have the system set to open a Finder window when a disc is inserted. To set your system:

1. From the **Apple** menu, choose **System Preferences**.
2. Click the CDs & DVDs icon in the System Preferences window (or choose **View > CDs & DVDs**).
3. Choose **Open Finder** from the **When you insert a blank CD** pop-menu.
4. Choose **Open Finder** from the **When you insert a blank DVD** pop-up menu.
5. Close the System Preferences window

Exporting Versions to share with clients

You may sometimes wish to send a client a disc with sample images from a shoot. In most cases you will wish to send adjusted versions of the sample images.

1. Insert a blank disc into the computer's optical drive.
2. The disc will appear on your Desktop as "Untitled CD" or "Untitled DVD." Rename it as you like.
3. Select an image or group of images in Aperture's browser and choose **File > Export > Export Version**.
4. In the Export dialog, select the export preset you wish to use and navigate to the burn folder on your Desktop. In the image below, the burn folder has been named "Aperture Export 1/24/2007".

5. Click the Export Versions button. The image versions will be rendered to the burn folder. If you have specified a Subfolder Format as part of the export preset, subfolders will be created.
6. If necessary, select additional images and export them to the burn folder.
7. When you have exported all the images needed, double-click the disc icon on the Desktop to open the burn folder. Click the Burn button in the upper right corner of the window.

Backing up masters

If you wish to burn your original master images to an optical disc, follow these steps:

1. Insert a blank disc into the computer's optical drive.
2. The disc will appear on your Desktop as "Untitled CD" or "Untitled DVD." Rename it as you like.
3. Select an image or group of images in the Aperture browser.
4. Choose **File > Export > Export Masters**.
5. In the Export dialog, select the Subfolder Format and Name Format you wish to use. If you wish to export metadata along with the master images, select Create IPTC4XMP sidecar file.
6. Navigate to the burn folder. In the image below, it is named "Aperture Master Backup."

7. Click the Export Masters button. The masters will be copied to the burn folder, along with XMP side car files, if you so specified.
8. If necessary, select additional images and export them to the burn folder.
9. When you have exported all the masters needed, double-click the disc icon on the Desktop to open the burn folder. Click the Burn button in the upper right corner of the window.

Backing Up Projects

You can selectively backup particular projects to a disc.

1. Insert a blank disc into the computer's optical drive.
2. The disc will appear on your Desktop as "Untitled CD" or "Untitled DVD." Rename it as you like.
3. In the Projects Panel highlight the project you wish to back up.
4. Right-click (or Ctrl-click) the project icon in the Project Panel. Choose **Export > Export Project** from the shortcut menu.
5. The export project dialog will open.

6. Navigate to the burn folder. In the image above, it's named "Aperture Project Backup."
7. Click the Save button. If the project consists of managed images, all the project data including masters will be copied. If the project contains referenced images, whether or not the referenced masters are copied depends on whether the Consolidate images into exported project option is selected in the Export dialog. It is very important to select this option if you want the referenced masters to be included in the backup.
8. If necessary, select additional projects and export them to the burn folder.
9. When you have exported all the projects needed, double-click the disc icon on the Desktop to open the burn folder. Click the Burn button in the upper right corner of the window.

Archiving projects containing managed images

You can reference the master images for projects to optical discs, while keeping JPEG previews available for viewing within Aperture. This procedure presupposes that you have created JPEG previews for the projects you archive as described below. For more information on JPEG previews, click here.

1. Insert a blank disc into the computer's optical drive.
2. The disc will appear on your Desktop as "Untitled CD" or "Untitled DVD." Rename it as you like.
3. Highlight a project you'd like to archive in the Project Panel
4. Select an image in the browser, then press Command + A to select all the images in the project.
5. Right-click (or Ctrl-click) the project in the Project Pane and choose **Relocate Masters for Project** from the shortcut menu.
6. The Relocate masters dialog will open.
7. Choose the Subfolder Format and Name Format you'd like to use, and navigate to a locally accessible folder on a local hard drive.
8. Click the Relocate Masters button. The master images will be moved from the Aperture library to the folder specified in the previous step.
9. If necessary, select additional projects and relocate them as well. You may wish to create a folder for each project.
10. Drag the folder(s) containing the relocated masters to the burn folder.
11. Double-click the disc icon on the Desktop to open the burn folder. Click the Burn button in the upper right corner of the window.
12. When the burn and verification has completed, check to be sure your master images are safely archived. You can check by opening them with Preview.
13. If you like, you can delete folder(s) containing the master images from your hard drive. The JPEG previews will still be available. If you need the masters again in the future, copy them from the optical disk, and reconnect them, or reconnect to the images directly on the disc. For more details on reconnecting images, see page 137 of the Aperture User Manual.
    .

Archiving projects containing referenced images

1. Insert a blank disc into the computer's optical drive.
2. The disc will appear on your Desktop as "Untitled CD" or "Untitled DVD." Rename it as you like.
3. Drag the folder that contains the masters to the burn folder for the disc. If the masters for the project are scattered in different locations, you may wish to first select them all in the Aperture browser and choose **File > Relocate Masters for Project**.
4. If necessary, repeat for any additional referenced projects you'd like to archive.
5. Double-click the disc icon on the Desktop to open the burn folder. Click the Burn button in the upper right corner of the window.
6. When the burn and verification has completed, check to be sure your master images are safely archived. You can check by opening them with Preview.
7. If you like, you can delete folder(s) containing the master images from your hard drive. The JPEG previews will still be available. If you need the masters again in the future, copy them from the optical disk, and reconnect them, or reconnect to the images directly on the disc. For more details on reconnecting images, see page 137 of the Aperture User Manual.

For more general information about burning discs in OS X, click here.

Some USB Bluetooth adaptors may not allow wireless keyboard or mouse to wake some Macs from sleep

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some third-party USB Bluetooth adaptors, such as the D-Link DBT-120 (C1 rev or later) may not allow wireless keyboards or mice to wake some Macs from sleep.

Solution

Note: Your Mac may have Bluetooth built-in, making the use of a USB adaptor unnecessary.

To wake the computer

To wake the computer, press the computer's power button once. This will wake the computer from sleep. If you see an alert asking if you'd like to Restart, Sleep, Shutdown or Cancel. click Cancel.

Workaround for the issue

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Bluetooth**.
3. Make sure Allow Bluetooth devices to wake this computer is selected (checked).

If this setting is dimmed ("grayed out") and you have a D-Link DBT-120 adaptor, follow these steps:

1. Disconnect the USB Bluetooth adaptor.
2. See if the adaptor's "HW" version is C1 or later.

Apple has identified issues waking from sleep with certain models of the D-Link DBT-120 adaptor with hardware versions of C1 or later. Models with versions of B2 through B4 are not affected by this issue.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.4 (Japanese): Name a software RAID with ASCII characters initially

This article has been archived and is no longer updated by Apple.

When setting up a software RAID with Disk Utility in the Japanese language version of Mac OS X 10.4, you should initially give the software RAID a name that uses ASCII characters only (not 2-byte characters). For example, characters used in the English language, but not Japanese.

After installation is complete, you can rename the software RAID with a Japanese character-based name (2-byte characters) if you wish.

This document will be updated as more information becomes available.

About the Daylight Saving Time Update for Mac OS X 10.3.9

This article has been archived and is no longer updated by Apple.

The Daylight Saving Time Update for Mac OS X 10.3.9 updates your Daylight Saving Time and time zone rules to the latest available information as of January 7, 2007 (2007-01-07). This includes the new start and end dates for Daylight Saving Time in the US and Canada, as well as recent time zone updates in Australia, Brazil, and other countries.

This update requires Mac OS X 10.3.9 or Mac OS X Server 10.3.9. It is available via automatic Software Update, or as a standalone update. You only need to use one of these methods to update your computer.

For more information about the 2007 Daylight Saving Time changes and other Apple Daylight Saving Time updates, see this article.

Published Date: Feb 20, 2012

About the Daylight Saving Time Update for Mac OS X 10.4.8

This article has been archived and is no longer updated by Apple.

The Daylight Saving Time Update for Mac OS X 10.4.8 updates your Daylight Saving Time and time zone rules to the latest available information as of January 7, 2007. This includes the new start and end dates for Daylight Saving Time in the province of Alberta, Canada, as well as recent time zone updates in Australia, Brazil, and other countries. The new 2007 Daylight Saving Time rules for the US and the rest of Canada are already installed as of Mac OS X 10.4.5 or later (see this article for more information).

This update requires Mac OS X 10.4.8 or Mac OS X Server 10.4.8. It can be installed on both Intel- and PowerPC-based Macs. It is available via automatic Software Update, or as a standalone download. You only need to use one of these methods to update your computer.

For more information about the 2007 Daylight Saving Time changes and other Apple Daylight Saving Time updates, see this article.

AirPort Extreme 802.11n Enabler requires AirPort Extreme Update

This article has been archived and is no longer updated by Apple.

Issue or symptom

The AirPort Extreme 802.11n Enabler requires AirPort Extreme Update 2007-001 or later. If you attempt to install the AirPort Extreme 802.11n Enabler without first installing the AirPort Extreme Update 2007-001 or later, this alert will appear:

"You cannot install AirPort Extreme 802.11n Enabler on this volume. This volume does not meet the requirements for this update."

Solution

Download and install the AirPort Extreme Update.

Mac OS X Server 10.4: Using High Availability IP Failover

This article has been archived and is no longer updated by Apple.

High Availability IP Failover may not work as expected in Mac OS X Server 10.4.7 (Universal) or later.

IP failover does not work with Intel-based Macs and Mac OS X Server 10.4.7 - 10.4.10

With Mac OS X Server 10.4.7 (Universal) or 10.4.10, IP failover does not work with Intel-based Macs. Update to Mac OS X Server 10.4.11 or later to use IP failover with Intel-based Macs.

Do not use mixed architectures in failover pairs

Do not mix Intel and PowerPC architectures in failover pairs. For example, if the master server is a Xserve Quad Xeon, do not use a Xserve G5 as failover. Conversely, a Mac Pro (Intel-based) should not be used as failover for a Xserve G5 (PowerPC-based).

Important: If you do not follow this guideline, data loss may occur.

Location of the failover scripts

The scripts are located in:

```
/Library/IPFailover
```

This folder is not present by default; you must create it yourself.

Note: The High Availability Administration guide incorrectly states the (/Library/Failover) directory is the location of the user-defined failover scripts.

TA24572_Logic_MP_files_sometimes_play_too_early.pdf

Logic: MP3 files sometimes play too early

This article has been archived and is no longer updated by Apple.

Issue

MP3 files added to the Arrange window may play 528 samples earlier than expected.

Solution

Insert a Sample Delay plug-in on any affected track, and set the delay to 528 samples to compensate.

Mail Database and Store sizes are not updated in Server Admin

This article has been archived and is no longer updated by Apple.

Issue or symptom

The displayed size of the Mail Server database and Mail Store may not update in real time when viewed in the Server Admin Mail section.

Solution

The Server Admin/Mail plug-in displays only the most-recently polled size of the Mail Database and Mail Store, which is checked once every 30 minutes. The Refresh button accesses the most-recently retrieved values only.

Automatically trained SpamAssassin databases are unused

This article has been archived and is no longer updated by Apple.

Issue or symptom

Mail sent to the "junkmail" and "notjunkmail mailboxes" for automatic training may not be used to train the database in the correct location.

Solution

If this happens, follow these steps to resolve the issue:

1. Log in as root.
2. Move the unused SpamAssassin database aside with this Terminal command (on a single line):

```
# mv /var/amavis/.spamassassin /var/amavis/.spamassassin.old
```

3. Create a link in that location to the correct database with this Terminal command:

```
# ln -s /var/clamav/.spamassassin /var/amavis/.spamassassin
```

ATA, IDE, EIDE and ATAPI Defined

The information below outlines the general definition of each of these terms.
This article has been archived and is no longer updated by Apple.

IDE/ATA

The original, base specification for the family of interfaces described in this section is called both IDE and ATA. The name IDE is the more popular of the two, even though it is misleading since it stands for integrated drive electronics which refers to putting the logic board with the hard disk much more than it has anything to do with the interface. The more correct name is ATA or AT Attachment, which defines the standard interface.

The original IDE/ATA standard defines the following features and transfer modes:

Two Hard Disks: The specification calls for a single channel, shared by two devices that are configured as master and slave.

PIO Modes: ATA includes support for PIO modes 0, 1 and 2.

DMA Modes: ATA includes support for single word DMA modes 0, 1 and 2, and multiword DMA mode 0.

"Plain" ATA does not include support for enhancements such as ATAPI support for non-hard-disk IDE/ATA devices, block mode transfers, or logical block addressing.

The Power Macintosh G3 (Blue & White) and all subsequent Macintosh computers have master and slave capability. Prior Macintosh computers, including all Performa models and all Power Macintosh Models with four-digit model names, do not have this capability. For more information, please see article 24342: "**Power Macintosh G3: Master and Slave Support and Configuration**"

EIDE

Enhanced IDE, also called EIDE, is the term that Western Digital uses to describe its advanced drives that incorporate the performance improvements defined in ATA-2, along with several other refined protocols. EIDE has become a widely-accepted term in the industry, which would be great if not for the fact that it is used to stand for so many things, some of them completely different. For this reason, the term has been criticized--not least by Western Digital's competitors--for being confusing and vague.

Western Digital describes its Enhanced IDE program as including the following improvements over ATA:

ATA-2: EIDE includes all of the improvements that are part of ATA-2, including higher-speed transfer modes.

ATAPI: EIDE includes support for non-hard-disk devices on the IDE/ATA channel.

Dual IDE/ATA Host Adapters: The EIDE standard includes support for dual IDE/ATA host adapters, allowing four IDE/ATA/ATAPI devices to be used.

The Power Macintosh G3 (Blue & White) and all subsequent Macintosh computers have master and slave capability. Prior Macintosh computers, including all Performa models and all Power Macintosh Models with four-digit model names, do not have this capability. For more information, please see article 24342: "**Power Macintosh G3: Master and Slave Support and Configuration**"

ATAPI

AT Attachment Packet Interface (ATAPI is the description used to identify non-hard-disk devices used on the IDE/ATA channel. This includes CD-ROM, tape, and ZIP type drives. You could say that ATAPI refers to ATA drives that support removable media.

For more information see article 24342: "**Power Macintosh G3: Master and Slave Support and Configuration**"

What is a Transitional Security Network (TSN)?

This article has been archived and is no longer updated by Apple.

A Transitional Security Network (TSN) is a network that uses the Transitional Security Network Protocol that allows clients to authenticate with networks in the most secure way possible, based on the capabilities of their hardware and software. Computers capable of connecting using the WPA standard will be able to authenticate using a WPA password. Computers that do not meet the requirements to authenticate using WPA will use WEP instead.

The same password is used on all clients of the Transitional Security Network, regardless of the specific authentication method they use.

About Security Update 2007-002

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2007-002, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2007-002

- **Finder**

  CVE-ID: CVE-2007-0197

  Available for: Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Mounting a maliciously-crafted disk image may lead to an application crash or arbitrary code execution

  Description: A buffer overflow exists in Finder's handling of volume names. By enticing a user to mount a malicious disk image, an attacker could trigger this issue, which may lead to an application crash or arbitrary code execution. A proof of concept for this issue has been published on the "Month of Apple Bugs" website (MOAB-09-01-2007). This update addresses the issue by performing additional validation of disk images. This issue does not affect systems prior to Mac OS X v10.4. Credit to Kevin Finisterre of DigitalMunition for reporting this issue.

- **iChat**

  CVE-ID: CVE-2007-0614, CVE-2007-0710

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Attackers on the local network may be able to cause iChat to crash

  Description: A null pointer dereference in iChat's Bonjour message handling could allow a local network attacker to cause an application crash. A proof of concept for this issue in Mac OS X v10.4 has been published on the "Month of Apple Bugs" website (MOAB-29-01-2007). A similar issue exists in Mac OS X v10.3. This update addresses the issues by performing additional validation of Bonjour messages.

- **iChat**

  CVE-ID: CVE-2007-0021

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Visiting malicious websites may lead to an application crash or arbitrary code execution

  Description: A format string vulnerability exists in the iChat AIM URL handler. By enticing a user to access a maliciously-crafted AIM URL, an attacker can trigger the overflow, which may lead to an application crash or arbitrary code execution. A proof of concept for this issue has been published on the "Month of Apple Bugs" website (MOAB-20-01-2007). This update addresses the issue by performing additional validation of AIM URLs.

- **UserNotification**

  CVE-ID: CVE-2007-0023

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Malicious local users may be able to obtain system privileges

  Description: The UserNotificationCenter process runs with elevated privileges in the context of a local user. This may allow a malicious local user to overwrite or modify system files. A program that triggers this issue has been published on the "Month of Apple Bugs" website (MOAB-22-01-2007). This update addresses the issue by having UserNotificationCenter drop its group privileges immediately after

launching.

Mac OS X 10.4 or later: Unable to define custom envelope or label sizes in Address Book

This article has been archived and is no longer updated by Apple.

Issue or symptom

The first time you try to define a custom label size or a custom envelope size, you may be unable to edit the numbers displayed in the measurement fields (height, width, margins, and so forth).

Solution

As a workaround, follow these steps:

1. Open Address Book.
2. Select a card which includes a mailing address.
3. From the **File** menu, choose **Print...**.
4. In the Print Dialog window, choose Define Custom from the Layout pop-up menu.
5. Enter a Layout Name and click OK.
6. You should now be able to edit the numbers in the measurement fields.

If you still cannot edit, leave the Print dialog open and switch to another application, then switch back to the Address Book Print dialog. You should now be able to edit the numbers in each of the measurement fields.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Mac OS X 10.4.4 or later: Address Book cards show up as "(null)" in Speech preferences

This article has been archived and is no longer updated by Apple.

Issue or symptom

Address Book cards that do not contain a company name will be displayed with the name "(null)" when the Address Book command set is configured in the Speech pane of the System Preferences. All Address Book speech commands will work normally with these "(null)" cards, except the command "[Phone, Fax, Pager] for [Full name, Nickname]" which will not display a phone number.

Solution

To get Address Book cards to show up correctly in the Speech pane of System Preferences or to be able to display a phone number from an Address Book card using a speech command, complete these steps:

1. Open Address Book.
2. Click Edit at the bottom of the Address Book window.
3. Click on the names of people in Address Book and look for cards that contain a blank Company field (the word "Company" will be displayed in gray under the person's name).
4. Click on the dimmed (gray) word "Company" on the card and type in a name. If the person is not associated with any company, you can enter their name again in the Company field. You do not need to check the box next to the word "Company".

Any Address Book cards that have a name entered in the Company field should be displayed correctly when configuring Address Book commands in the Speech pane of System Preferences.

Note: You can now use the person's name with the speech command "[Phone, Fax, Pager] for [Full name, Nickname]" but when the phone number gets displayed on-screen, it will show the company's name (rather than the person's name) above the phone number.

Additional information

If the Speech Commands window is blank in Mac OS X 10.4 or later, see this article instead.

Published Date: Feb 20, 2012

Mac OS X 10.4.9: "Disk image you are opening may be damaged..." alert appears

This article has been archived and is no longer updated by Apple.

Issue or symptom

Mac OS X 10.4.9 improves the ability of Mac OS X to detect damaged or corrupted disk images before mounting them. Mounting a damaged or corrupted disk image can result in data loss or corruption. This alert appears when you try to open or (mount) a damaged disk image:

> "The disk image you are opening may be damaged and could damage your system. Are you sure you want to open this disk image?"

Solution

If you have another copy of the files that are on the affected disk image

1. Make a new image in Disk Utility and copy the original files to the new image.
2. Discard the original, affected image.
3. As a precaution, open (mount) the new image, open Disk Utility, and repair the new image. Continue to repair until no issues are found.

If you have no other copy of the files on the affected disk image

Try repairing the directory structure of your disk images with Disk Utility.

1. Make a copy of the affected image in the Finder (select it, then from the Finder's **File** menu choose **Duplicate**). A duplicate image whose name ends with "copy" will be created (you will need sufficent free disk space).
2. Open (mount) the copied disk image file in the Finder. When the alert appears, click "Open".

   Important: If you are unable to mount the image in the Finder, the image may be unusable. If you are able to open the image in a previous version of Mac OS X, some data may be damaged. Use the data with caution.

3. Open Disk Utility (located in the Utilities folder, within the Applications folder).
4. Select the copied disk image's icon in the left side of the Disk Utility window, then click Repair Disk. A verification will be performed and, if necessary, repairs.
5. Click Repair again. Repeat this step until no issues are found on the image.

   Note: If repairs cannot be performed because the image is read-only, convert the image to a read/write format with a new name (don't replace the existing image with a same-named image). Then perform step 4 and 5 on the converted image. After repairs are complete, you can convert the image back to a read-only format and rename it if desired.

You should now be able to use the disk image without any issues.

Additional information

It is possible for a damaged disk image to cause directory issues to your Mac OS X volume.

Mac OS X 10.4.5 or later: Headphone volume reverts to default setting after restarting computer

This article has been archived and is no longer updated by Apple.

Issue or symptom

After restarting in Mac OS X 10.4.5 or later on some Intel-based Macs, the output volume level and balance settings for headphones or other devices connected to your computer's headphone jack may revert to the default settings. The default settings are: Mute is disabled, volume is set to 56% of maximum, and balance is equal for the left and right channels.

Solution

Adjust the volume level and balance as desired after restarting the computer.

This document will be updated as more information becomes available.

Aperture: Benefits included with the Mac OS X 10.4.9 Update

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.9 Update includes many benefits for Aperture:

- Adds support for the RAW image formats of these third-party cameras: Leaf Aptus 17, Leaf Aptus 22, Leaf Aptus 65, Leaf Aptus 75, Leaf Valeo 11, Leaf Valeo 17, Leaf Valeo 22, Leica Digilux 3, Nikon D40, Pentax K10D, Pentax K110D, Pentax K100D, Panasonic Lumix DMC-L1, Samsung GX-1L.
- Improved Spot & Patch results: The update contains changes to Core Image that improve the visual correctness of images using Spot & Patch adjustment.
- Reduces issues of temporary "black" Viewer: Mac OS X 10.4.9 addresses several issues that could cause the Viewer to temporarily turn black when displaying adjusted images.
- GPS metadata is preserved when image versions are exported.
- Incorporates all RAW file format compatibility and other imaging issues originally addressed in Digital Camera RAW Support Update 1.0.1. This update improved RAW file format compatibility for the Canon Digital Rebel XTi / 400D / Kiss X Digital, Nikon D80, and Pentax *ist DS. It also addressed the following issues: Handling of large Canon RAW files (.CRW); DNG compatibility on Intel-based Macs; Lines sometimes appearing in images exported from Aperture. For more information, see this page or this page.

For more information about this update, see About the Mac OS X 10.4.9 Update (delta).

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iPhoto 6: Setting regional calendar preferences

This article has been archived and is no longer updated by Apple.

Learn how to set region-specific preferences for iPhoto calendars.

Why are my iPhoto calendars in English, even though my primary language is set to something else?

- iPhoto uses the Region setting in the Formats tab of the International System Preferences pane to format its calendars. If you change the setting in this tab to match your region, the language change should be reflected the next time you relaunch iPhoto and create a new calendar.
- If you do not see your Region listed, select the option to "show all regions" in this preference pane.

How can I change my calendar to start weeks on Monday instead of Sunday?

- If you are in an English-speaking country and want your calendar week to start on Monday, set your Region in the Formats tab of the International preference pane to United Kingdom.
- If you are in an English-speaking country and want your calendar week to start on Sunday, set your Region in the Formats tab to United States or Canada.

iMovie HD 6: Static in transitions using MPEG-4 project

This article has been archived and is no longer updated by Apple.

Issue or symptom

Audio may be missing or static may be introduced when adding transitions or effects (such as Reverse) to an MPEG-4 or iSight-based iMovie project.

Solution

Remove the existing transition or effect, extract the audio from the affected clips, and reinsert the transition or effect.

1. Select the transition that caused this issue and press the delete key to remove it.
2. Select the clip or clips that will be used to build the transition or effect.
3. From the **Advanced** menu, choose **Extract Audio**. (The extracted audio appears as a separate clip in the audio track of the timeline viewer).
4. Reinsert the transition or effect.

Java: Updating time zones for earlier Java installations and backward compatibility

This article has been archived and is no longer updated by Apple.
In 2007, several countries and regions changed the way they observe Daylight Saving Time (DST). General information about these changes can be found here . How these changes affect Mac OS X specifically is described in this article.

To address these changes in Java, Apple has released two Java updates: Java for Mac OS X 10.4, Release 5 and Java for Mac OS X 10.3, Update 5, which are available in Software Update or from Apple Downloads. These updates add support for the latest Daylight Saving Time (DST) and time zone information as of January 8, 2007 using the Olson Timezone data version 2007a.

Important: The introduction of Olson Timezone (TZ) data, version 2007a or later may not allow backward compatibility for the Eastern, Hawaiian, and Mountain time zones for some Java applications under certain circumstances. See this article for information about using Sun's tzupdater tool to update your time zones, for best backward compatibility.

Compatibility issues (advanced)

For three time zones, Eastern Standard Time (EST), Hawaiian Standard Time (HST) and Mountain Standard Time (MST), backwards compatibility may not work in Java under certain circumstances. In Java 1.1 and earlier, some three-letter time zones followed Daylight Saving time rules instead of being fixed offsets of Greenwich Mean Time (GMT). If a Java application used these three-letter time zone designations, they may be assuming the previous behavior. The third-party utility "tzupdater", available from Sun Microsystems at http://java.sun.com/developer/technicalArticles/Intl/tzupdatertool.html, can be used to update your Java installation to preserve this backwards-compatible behavior.

To update your Java with the backwards compatibility option, first download tzupdater. Then in Terminal go to the directory where you installed tzupdater and execute the following command on a single line:

```
sudo /System/Library/Frameworks/JavaVM.framework/Versions/1.5.0/Commands/java -Djava.vendor="Sun Microsystems Inc." -jar tzupdater.jar  -f -bc -u
```

Verify the changes were installed by using this command:

```
/System/Library/Frameworks/JavaVM.framework/Versions/1.5.0/Commands/java -Djava.vendor="Sun Microsystems Inc." -jar tzupdater.jar -bc -t
```

If no issues are reported, you have successfully updated Java. Please see the documentation that comes with Sun's tzupdater for additional information.

See Sun Alert 102836 for more details on the Olson Timezone data backwards compatibility issue.

Final Cut Pro: Ethernet network volumes should not be used for capture or playback

This article has been archived and is no longer updated by Apple.

Issue

In Final Cut Pro, hard drives designated as "scratch disks," store captured and rendered media for editing, playback, and output. Final Cut Pro may drop frames during capture, playback, or output if you have set the scratch disk location to be a network hard drive that is connected to your computer via Ethernet.

Scratch disk performance is a critical aspect of your editing system. The available data rate of your disks must match or exceed the video format you are using.

Even in cases where the data rate of the Ethernet standard exceeds the data rate required by the video format you are using, dropped frames can occur. This can happen because Final Cut Pro will often need to access more than one stream of audio/video media at a time. Additionally, the available bandwidth on an Ethernet network must accommodate the overhead required by networking protocols, as well as any traffic on the network generated by other users or by automated processes. In most professional workflows, Ethernet will not provide sufficiently high sustainable bandwidth for the smooth transfer of video and audio data needed by Final Cut Pro. (This includes "wired" Ethernet formats, as well as wireless variants, i.e., 802.11a, b, g and n.)

Solution

Use hard drives installed inside your computer, or external drives that are directly connected to your computer via FireWire or SCSI. Multi-user or high-capacity environments may require a RAID or SAN that is directly connected to the computer via a Fibre Channel connection.

For more information about setting scratch disks, refer to the Final Cut Pro User Manual.

AirPort Extreme (802.11n): Use AirPort Utility, only, to configure the AirPort Extreme (802.11n) base station

This article has been archived and is no longer updated by Apple.

AirPort Extreme (802.11n) base stations include AirPort Utility. You should always use AirPort Utility, not any other AirPort assistants or utilities, when setting up or configuring your AirPort Extreme (802.11n) base station.

Note: Unexpected results may occur when using other utilities with this base station, such as the AirPort Setup Assistant or AirPort Admin Utility--do not use these with an Airport Extreme (802.11n) base station.

AppleCare Agreements - Information and FAQs

This article has been archived and is no longer updated by Apple.

Because Apple creates the hardware, operating system and many built-in applications, Apple computers are truly integrated systems with vastly superior support. AppleCare offers a range of service and support products to meet your needs. In addition, there are numerous online resources within the AppleCare Support website that provide valuable information and instruction.

For information about all AppleCare Products and Services, please visit www.apple.com/support/products .

For questions related to AppleCare Protection Plan, please visit the AppleCare FAQ page at http://www.apple.com/support/products/faqs.html.

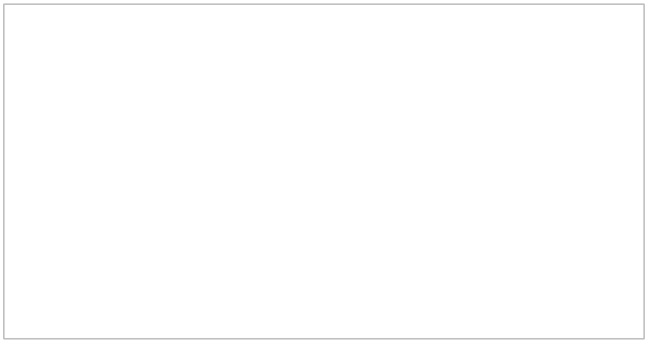
Update to iOS 12

Enjoy a faster and more responsive experience as well as fun new features, like Memoji and Camera Effects.

Get iOS 12



Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

Mac OS X Server (Universal) 10.4.7 through 10.4.10: May become unresponsive when clients search mounted network volumes

This article has been archived and is no longer updated by Apple.

Issue or symptom

As clients search mounted network volumes, the kernel_task process (pid 0) on the server is allocated more and more RAM. System administrators may notice that the amount of RAM allocated to the kernel_task process may be close to 2 GB. On servers configured with 2 GB or 3 GB of RAM, this can result in server performance degrading, or the server becoming unresponsive, or restarting unexpectedly.

Solution

Update to Mac OS X Server 10.4.11 to resolve this issue.

If you are uable to update to Mac OS X Server 10.4.11 you can make following change to /etc/rc.server to improve performance in this situation. This is recommended only if your server has 2 GB, 3 GB, or 4 GB of RAM.

1. Make a copy of /etc/rc.server with this command:

   ```
   $ sudo cp /etc/rc.server /etc/rc.server.bak
   ```
2. As the root user, open /etc/rc.server in the text editor of your choice.
3. Locate this line in /etc/rc.server:
   sysctl -w kern.maxnbuf=90000
4. Change the number 90000 to 20000, so that the line reads:
   sysctl -w kern.maxnbuf=20000
5. Save the changes made to /etc/rc.server.
6. Restart the server.

Final Cut Pro: Codec error when exporting as H.264

This article has been archived and is no longer updated by Apple.

Issue

If you export a QuickTime movie from Final Cut Pro 5 in the H.264 format, it's possible for the operation to result in a message that says, "Codec error."

If this happens, no file is exported. This can occur if you choose **File > Export > QuickTime movie**, and then choose Custom, and set H.264 as the compressor.

Workarounds

To avoid this issue, you can export from Final Cut Pro via different export options:

You can export using Compressor, which offers a high degree of control over the options available when exporting as H.264.

1. Choose **File > Export > Using Compressor**.
2. Choose a Setting (or create a custom Setting) in Compressor with the H.264 options you desire.
3. If necessary, refer to the Compressor User Manual for further information on using Compressor.

You can also export using QuickTime Conversion, which offers fewer options than Compressor, but may be simpler to use.

1. Choose **File > Export > Using QuickTime Conversion**.
2. In the **Save** window, choose **QuickTime Movie** from the **Format** pop-up menu.
3. Click the **Options** button to open the Movie Settings window.
4. Click the **Settings** button in the **Video** portion of the Movie Settings window.
5. Choose **H.264** from the **Compression Type** pop-up menu.

This document will be updated as more information becomes available.

Xsan: File System Status reported by cvfsck does not indicate need for repair

This article has been archived and is no longer updated by Apple.

Issue or symptom

When using `cvfsck` to verify or repair an Xsan filesystem, the Xsan Volume's "File System Status" is reported as "Clean" or "Dirty", but not whether repair is needed or not.

Solution

The File System Status does not reflect whether the filesystem is damaged or not. Do not reference the File System Status when deciding whether or not a filesystem needs repair.

In order to determine if a filesystem is corrupted, look at the last lines of the cvfsck report. If you see a message such as this:

"`*Warning*: !!READ_ONLY!! File system 'Volume_Name' would have been modified!`"

... then your volume is in need of repair.

Export your iMovie projects to use on Apple TV

This article has been archived and is no longer updated by Apple.

You can watch your home movies on Apple TV by exporting them from iMovie. Depending on your source material (SD or HD), the iMovie export option provides video encoding up to 1280x720, 24 fps Progressive. QuickTime 7.1.5 or later is required.

Note that files created using the "Movie to Apple TV" option will **not** be compatible with iPod.

Follow these steps to export your iMovie to Apple TV:

1. In iMovie, choose **Share > QuickTime**.
2. From the **Compress movie for** pop-up menu, choose **Expert Settings**.

3. Click Share.
4. When the "Save exported file as" window appears, choose **Movie to Apple TV** from the **Export** pop-up menu.

5. From the **Where** pop-up menu, select a destination for your movie then click Save.

Once you completed these steps you can import your movie into iTunes so you can use it with Apple TV.

1. Open iTunes.
2. Locate your exported movie and drag it to the iTunes Movies library.
3. Sync the movie to Apple TV.

Note: If you have setup iTunes to copy files to iTunes Music folder, then you can delete your exported file. This option is located in the iTunes Preferences. Choose **iTunes > Preferences** and click Advanced. Click the General tab and then see if the "Copy files to iTunes Music folder when adding to library" option is selected.

Final Cut Pro: Additional RAM may be recommended for High Definition video formats

This article has been archived and is no longer updated by Apple.

Issue

Final Cut Pro may drop video frames in cases where there is not enough system memory available. For instance, if you're editing an uncompressed 8-bit or 10-bit high-definition codec, and you're monitoring video externally via a PCI or PCI-E video interface, Final Cut Pro may drop frames occasionally if your computer does not have sufficient system RAM.

Solution

Install additional RAM in your computer to increase the amount of memory available to Final Cut Pro. **Note:** The following table corresponds to the memory recommendations for Final Cut Pro only. If you run other applications at the same time as Final Cut Pro, they will allocate additional memory from the system, reducing the amount available to Final Cut Pro.

HD formats:	Suggested RAM
HDV formats	2 GB
Compressed HD formats	2 GB
Uncompressed HD formats	4 GB

Refer to manufacturer's recommendations for the memory requirements of your video interface:

- AJA Video Systems, manufacturer of the KONA family of video interfaces
- Blackmagic Design, manufacturer of the DeckLink family of video interfaces

Note: On Mac Pro systems, the distribution of memory modules may affect the performance characteristics of your video applications. See Final Cut Studio: For best performance on Mac Pro, install memory in risers symmetrically.

Final Cut Pro: P2 clips should be named with fewer than 255 characters

This article has been archived and is no longer updated by Apple.

Issue

If you name a P2 clip with a very long name in the Import Panasonic P2 window, it's possible that the clip might not be added to your project when you import.

Solution

Use fewer than 255 characters when naming clips in the Import Panasonic P2 window.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

AirPort Extreme (802.11n): Configuring ports for Personal File Sharing and Windows File Sharing

This article has been archived and is no longer updated by Apple.

Issue or symptom

When configuring Port Mapping with the AirPort Extreme (802.11n) base station to share Personal and Windows File Sharing, AirPort Utility may display an exclamation point next to the default public port assignments, indicating an issue.

Solution

By default, Personal File Sharing uses port 548 as the public port. Windows File Sharing uses 137-138 as default public ports.

These will need to be changed to an unused port in order to share these services between the base station network and the external network. Also, you should avoid port 548 because it is reserved for AirPort disk.

If the sharing a hard disk function is not needed from your base station, go to the Airport Utility and uncheck the 'Enable file sharing' checkbox in the File Sharing tab. This will free up port 548 and ports 137-138.

See this article for information about which ports are already in use by other services.

Published Date: Oct 10, 2016

Logic Pro/Express: Faders or Buttons on Control Surface trigger MIDI notes instead of expected functions

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you use buttons or faders on a control surface with Logic, the controls may not act as expected. If a Software Instrument or MIDI track is selected, the faders and buttons may trigger MIDI notes.

Solution

This can happen if a MIDI interface or USB keyboard is disconnected while Logic is running. Avoid changing your physical MIDI setup while Logic is running. If this does happen, reconnect the missing device, or quit and relaunch Logic.

Published Date: Feb 20, 2012

Mac OS X 10.4: Repeatedly asked to insert Install DVD Disc 2 during installation

This article has been archived and is no longer updated by Apple.

Issue or symptom

When installing Mac OS X 10.4 with the Install DVDs that came with your computer, you might be asked to insert Disc 2 repeatedly. This can happen if the disc is unreadable.

Solution

Check Disc 2 for smudges, scratches, or debris. Wiping the disc clean with a soft, lint-free cloth may help.

If the issue persists, use another Disc 2. If another Disc 2 is not available, you can complete the installation of Mac OS X with just Disc 1; follow these steps:

1. Hold your Mac's power button until it turns off.
2. With Disc 1 in hand, press the power button and immediately insert it and hold the C key until you see the Apple logo. Your Mac should start from Disc 1.
3. Once started from Disc 1, start the installation process again.
4. When the "Easy Install on 'Macintosh HD'" window appears, click the Customize button. (If your destination volume is not named "Macintosh HD", a different name will appear.)
5. Uncheck (deselect) the item "Bundled Software". You may need to click it twice to deselect it.
6. Click the "Install" or "Upgrade" button to begin the installation. Disc 2, which contains additional bundled software, should not be needed for this installation. At the end of the installation you will have a functional Mac to use.

Note: Contact AppleCare Support about getting a replacement installation Disc 2. Once you have a a replacement Disc 2, you can use it to install the bundled software. You may need to perform an Archive & Install installation to install the bundled software from Disc 2.

Mac OS X Server Netinstall: Create new images on servers running the same version of system software

This article has been archived and is no longer updated by Apple.

Issue or symptom

Netinstall image creation may not occur if the system version of the image is significantly newer than the system version running on the server. For instance, if you try to create a Mac OS X 10.4 image on a server running Mac OS X 10.3, you will see the message "A bill of materials (BOM) file required to create this file image is missing from the source" and the image will not be created.

Solution

Make sure that the server is running the same reference release (for example, 10.4.x) as the Netinstall image you are creating.

Published Date: Oct 10, 2016

DVD Studio Pro: Disable CSS before converting a project to HD

This article has been archived and is no longer updated by Apple.

Issue

If CSS is enabled in the Region/Copyright tab of the Disc Inspector for a Standard Definition project, and you convert that project into a High Definition project, the CSS setting will be stuck on, and you will be unable to switch it off for that project.

Solution

Before you convert a Standard Definition project to a High Definition project, make certain that the **Format for CSS** checkbox in Disc Inspector is **not checked**.

The **Format for CSS** checkbox should not be checked when converting a SD project to HD.

Even though CSS is not applicable in the context of High Definition DVD projects, unexpected results may occur if you attempt to format a project that had CSS enabled when it was converted from Standard Definition.

If you have already converted an SD project that had Format for CSS selected to an HD project, you can still format the HD project for replication if you deselect the Copyright Management checkbox, also in the Disc Inspector's Region/Copyright tab.

Published Date: Feb 20, 2012

Final Cut Pro: Subclip sent to Soundtrack Pro may be longer than intended

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you send a subclip from Final Cut Pro to a Soundtrack Pro Audio File Project, the resulting project may contain the entire original clip from which the subclip was created.

Solution

This is a known issue. Although the Soundtrack Pro Audio File Project may appear to be too large, the in and out points will still be correct in Final Cut Pro.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

About FireWire 400 Technology

Learn about FireWire 400 technology used for Macintosh computers.
This article has been archived and is no longer updated by Apple.

What is FireWire?

FireWire is a cross-platform implementation of the high speed serial data bus -- defined by IEEE Standard 1394-1995 -- that can move large amounts of data between computers and peripheral devices. It features simplified cabling, hot swapping and transfer speeds up to 400 megabits per second. Major manufacturers of multimedia devices are already adopting the FireWire technology.

Invented at Apple, FireWire enables the connection of new digital consumer products including digital camcorders, digital video tapes, digital video disks, set-top boxes, and music systems directly to the personal computer. Apple is a cofounder of the 1394 Trade Association and is actively participating in the group's market and technology development activities.

Mac OS Support

The Mac OS is being extended to provide services and support for FireWire drivers and the applications that control them. This support exists below the Toolbox level, so developers of existing high-level applications do not need to modify their code to take advantage of FireWire input/output (I/O).

Main features of Mac OS support for FireWire include:

- A hardware abstraction layer that isolates peripheral driver code from host adapter driver code. This lets the computer work with multiple FireWire cards from different vendors.
- Automatic startup and runtime driver loading by a system expert.
- A native driver model for PCI-based Power Macintosh computers running System 7.6 and later.
- Works with many third party drivers for many device types.
- Hot connect and disconnect capabilities for devices.
- Asynchronous and isochronous services for drivers.
- Bus topology management.

Mac OS supports these features through a FireWire family expert and a set of FireWire family services.

FW Interface Modules

The FireWire interface module (FWIM) software architecture abstracts the hardware specifics of a FireWire card or logic board implementation into a standard interface. It resembles the SCSI interface module (SIM) architecture described in Inside Macintosh: Devices. The FWIM architecture lets multiple FireWire cards and devices from multiple vendors work together in a single system.

A FWIM is a hardware driver that Mac OS uses to access a FireWire bus. It exports a driver descriptor that Mac OS uses to match it with a FireWire card. When starting up, the Mac OS scans the Name Registry for devices that have a driver with the service category 'fwim'. It loads the appropriate FWIM and calls the FWIM's initialization routine. It then uses the FWIM interface to scan the bus for FireWire devices and loads their drivers, as described below. In this way, the Mac OS keeps track of which FWIM is associated with each device driver.

FW Device Drivers

FireWire device drivers follow the architecture described in Designing PCI Cards and Drivers for Power Macintosh Computers. Each driver is a Macintosh code fragment that exports a driver description structure.

When a FireWire bus reset occurs, the FireWire expert scans the bus for attached devices. It creates a Name Registry entry for each device, containing the device's Spec_Id and Sw_Version values. The expert then loads and installs the appropriate driver for each device by matching these values to the driver's description structure.

Once installed, the driver registers itself with the set of FireWire family services supplied by the Mac OS. Some of these services are described below.

Asynchronous Request Services

FireWire family services can be used to send asynchronous requests to nodes on a FireWire bus, including basic read, write, and lock requests. Atomic routines are also provided for logical bit operations, addition, and incrementing.

The asynchronous request services use reference IDs, which identify entities on the FireWire bus such as drivers, devices, interface cards, the isochronous resource manager, the bus manager, or the root device. A driver can use its own reference ID to specify the target of an asynchronous request. Using reference IDs reduces the complexity of a FireWire driver by making it unnecessary to deal with node IDs, topology generation numbers, and bus resets.

Isochronous Services
FireWire family services in Mac OS provide support for the isochronous data streams specified by the IEEE 1394 standard. These services include allocating isochronous channel numbers and bandwidth, as well as setting up and controlling data streams between a remote device and the local node or between multiple remote devices.

Isochronous services provide a flexible buffering mechanism to support a wide variety of data formats. They use isochronous channel IDs to construct pathways between devices and identify all the information needed to manage data transfers. Channel IDs also help coordinate the construction and control of isochronous channels between multiple drivers.

Configuration ROM Services
Mac OS services are provided for searching and accessing configuration ROMs on local and remote nodes of a FireWire bus, using relatively simple data structures. These services make it unnecessary for the driver to interpret the format of the CSR Configuration ROM directory hierarchy specified by the IEEE 1394 standard. Using configuration ROM entry IDs, drivers can reference specific entries in a CSR Configuration ROM and access their values.

FCP Services
Certain FireWire family services can be used to send Function Control Protocol (FCP) commands in a way similar to asynchronous requests. These services help drivers interpret and match FCP responses to outstanding FCP commands.

Bus Topology Services
FireWire family services help obtain information about the topology of a FireWire bus. Using them, a driver can access information such as the current bus topology map, a device's node ID, or a device's unique ID.

Apple Product Security: Common Criteria

This article has been archived and is no longer updated by Apple.

Common Criteria is an internationally approved set of security standards that provides a clear and reliable evaluation of the security capabilities of Information Technology products.

By providing an independent assessment of a product's ability to meet security standards, Common Criteria gives customers more confidence in the security of Information Technology products and leads to more informed decisions. Security-conscious customers, such as the U.S. Federal Government, are requiring Common Criteria certification as a determining factor in purchasing decisions. Since the requirements for certification are clearly established, vendors can target very specific security needs while providing broad product offerings.

The international scope of Common Criteria, currently adopted by fourteen nations, allows users from other countries to purchase Information Technology products with the same level of confidence, since certification is recognized across all complying nations.

Evaluating a product with respect to security requires identification of the customer's security needs and an assessment of the capabilities of the product. Common Criteria aids customers in both of these processes through two key components: protection profiles and evaluation assurance levels.

Common Criteria Tools & Administration Guide:

- Common Criteria Configuration & Administration Guide
- Common Criteria Tools for Mac OS X v10.3.6 - 10.3.9
- Common Criteria Tools for Mac OS X v10.4

Additional Resources:

See the following resources for further information:

- Common Criteria White Paper
- NIAP Evaluation Report
- National Information Assurance Partnership (NIAP) Home Page
- Common Criteria Test Cases (.dmg Setup file)

Published Date: Feb 20, 2012

Mac OS: Open Transport Compatibility

A general statement has been used to describe Mac OS/Open Transport compatibility:

Open Transport is supported on system software versions 7.1, 7.1.1, 7.1.2, 7.5.3, 7.5.5 or later. System software version 7.5.3 or later is recommended. No other system software versions are supported.

However, the statement does not specifically state compatibility with 7.6, 7.6.1, Mac OS 8 and 8.1.

Specifically, what are the supported versions of Open Transport with Mac OS 8.1 - what are the supported methods for installation?

Also, if OT 1.3 is supported by 7.1, what is the supported method for installation? Attempting to install OT 1.3 will result in the error that OT must be installed via the 8.1 installer.
This article has been archived and is no longer updated by Apple.
This is really fairly simple:

1) Open Transport 1.2 is available and supported only on Mac OS 8.

2) Open Transport 1.3 and 1.3.1 are available and supported only on Mac OS 8.1.

3) Previous versions of OT are supported on Systems running 7.1 or greater. Although you could run the OT 1.2 standalone installer from Mac OS 8.0 disk without having Mac OS 8.0 installed it is not a supported configuration. OT 1.3 and 1.3.1 will only install on a Mac OS 8.1 based system.

AirPort Extreme (802.11n) Base Station: Issues connecting to a WEP (TSN) protected network

This article has been archived and is no longer updated by Apple.

Issue or symptom

A computer or device may not connect to a AirPort Extreme (802.11n) Base Station's wireless network with a WEP (Transitional Security Network) password. This article does not apply to Macs with built-in AirPort Extreme (802.11g) cards.

Solution

Configure the affected computer or the wireless third-party device to connect via WEP 40/128-bit ASCII. For example, to do this on a Mac OS X-based computer that has an original AirPort card, follow these steps:

1. Click the AirPort icon and then **Other...** from the pulldown menu.

2. In the Closed Network window, select the desired Network Name from the pulldown menu, or type it in.

3. Select **WEP 40/128-bit ASCII** from the Wireless Security pulldown menu.

4. Enter the password of the network in the Password field and click OK.

About the security content of Mac OS X 10.4.9 and Security Update 2007-003

This article has been archived and is no longer updated by Apple.

This document describes the security content of Mac OS X 10.4.9 and Security Update 2007-003, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Installation note

Software Update will present the update that applies to your system configuration. Only one is needed. Security Update 2007-003 will install on Mac OS X v10.3.9 and Mac OS X Server v10.3.9 systems.

Mac OS X v10.4.9 contains the security fixes present in Security Update 2007-003 and will install on Mac OS X v10.4 or later, as well as Mac OS X Server v10.4 or later systems.

Security Update 2007-003 / Mac OS X v10.4.9

- **ColorSync**

  CVE-ID: CVE-2007-0719

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Viewing a maliciously-crafted image with an embedded ColorSync profile may lead to an unexpected application termination or arbitrary code execution

  Description: A stack buffer overflow exists in the handling of embedded ColorSync profiles. By enticing a user to open a maliciously-crafted image, an attacker can trigger the overflow, which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of ColorSync profiles. Credit to Tom Ferris of Security-Protocols for reporting this issue.

- **CoreGraphics**

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Viewing a malformed PDF Document may lead to an application hang

  Description: CoreGraphics has been updated to address the issue described on the Month of Apple Bugs web site (MOAB-06-01-2007), which may lead to an application hang.

- **Crash Reporter**

  CVE-ID: CVE-2007-0467

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Crash Reporter may allow a local admin user to obtain system privileges

  Description: Crash Reporter uses an admin-writable system directory to store logs of processes that have been unexpectedly terminated. A malicious process running as an admin can cause these logs to be written to arbitrary files as root, which could result in the execution of commands with elevated privileges. This issue has been described on the Month of Apple Bugs web site (MOAB-28-01-2007). This update addresses the issue by performing additional validation prior to writing to log files.

- **CUPS**

CVE-ID: CVE-2007-0720

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

Impact: Remote attackers may cause a denial of service during SSL negotiation

Description: A partially-negotiated SSL connection with the CUPS service may prevent other requests from being served until the connection is closed. This update addresses the issue by implementing timeouts during SSL negotiation.

- **Disk Images**

  CVE-ID: CVE-2007-0721

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Mounting a maliciously-crafted disk image may lead to an unexpected application termination or arbitrary code execution

  Description: A memory corruption vulnerability exists in diskimages-helper. By enticing a user to open a maliciously-crafted compressed disk image, an attacker could trigger this issue which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of disk images.

- **Disk Images**

  CVE-ID: CVE-2007-0722

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Mounting a maliciously-crafted AppleSingleEncoding disk image may lead to an unexpected application termination or arbitrary code execution

  Description: An integer overflow vulnerability exists in the handler for AppleSingleEncoding disk images. By enticing a local user to open a maliciously-crafted disk image, an attacker could trigger the overflow which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of AppleSingleEncoding disk images.

- **Disk Images**

  CVE-ID: CVE-2006-6061, CVE-2006-6062, CVE-2006-5679, CVE-2007-0229, CVE-2007-0267, CVE-2007-0299

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.8, Mac OS X Server v10.4.8

  Impact: Downloading a maliciously-crafted disk image may lead to an unexpected system shutdown or arbitrary code execution

  Description: Several vulnerabilities exist in the processing of disk images that may lead to an unexpected termination of system operations or arbitrary code execution. These have been described on the Month of Kernel Bugs and Month of Apple Bugs web sites (MOKB-03-11-2006, MOKB-20-11-2006, MOKB-21-11-2006, MOAB-10-01-2007, MOAB-11-01-2007 and MOAB-12-01-2007). Since a disk image may be automatically mounted when visiting web sites, this allows a malicious web site to cause a denial of service. This update addresses the issue by performing additional validation of downloaded disk images prior to mounting them.

- **DS Plug-Ins**

  CVE-ID: CVE-2007-0723

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Unprivileged LDAP users may be able to change the local root password

  Description: An implementation flaw in DirectoryService allows an unprivileged LDAP user to change the local root password. The authentication mechanism in DirectoryService has been fixed to address this issue.

- **Flash Player**

  CVE-ID: CVE-2006-5330

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

Impact: Playing maliciously-crafted Flash content could allow an HTTP request splitting attack

Description: Adobe Flash Player is updated to version 9.0.28.0 to fix a potential vulnerability that could allow HTTP request splitting attacks. This issue is described as APSB06-18 on the Adobe web site at http://www.adobe.com/support/security/

- **GNU Tar**

  CVE-ID: CVE-2006-6097

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Extracting a maliciously-crafted tar archive may lead to arbitrary files being overwritten

  Description: GNU Tar does not correctly handle tar archives that contain a GNUTYPES_NAME record with a symbolic link. By enticing a local user to extract a maliciously-crafted tar archive, an attacker may cause arbitrary files to be overwritten with the permissions of the person using tar. This issue has been addressed by performing additional validation of tar files.

- **HFS**

  CVE-ID: CVE-2007-0318

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Removing a file from a maliciously-crafted mounted filesystem may lead to a denial of service

  Description: An HFS+ filesystem in a mounted disk image can be constructed to trigger a kernel panic when attempting to remove a file from a mounted filesystem. This has been described on the Month of Apple Bugs web site (MOAB-13-01-2007). This update addresses the issue by performing additional validation of the HFS+ filesystem.

- **HID Family**

  CVE-ID: CVE-2007-0724

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Console keyboard events are exposed to other users on the local system

  Description: Insufficient controls in the IOKit HID interface allow any logged in user to capture console keystrokes, including passwords and other sensitive information. This update addresses the issue by limiting HID device events to processes belonging to the current console user. Credit to Andrew Garber of University of Victoria, Alex Harper, and Michael Evans for reporting this issue.

- **ImageIO**

  CVE-ID: CVE-2007-1071

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Viewing a maliciously-crafted GIF file may lead to an unexpected application termination or arbitrary code execution

  Description: An integer overflow vulnerability exists in the process of handling GIF files. By enticing a user to open a maliciously-crafted image, an attacker can trigger the overflow which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of GIF files. This issue does not affect systems prior to Mac OS X v10.4. Credit to Tom Ferris of Security-Protocols for reporting this issue.

- **ImageIO**

  CVE-ID: CVE-2007-0733

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Viewing a maliciously-crafted RAW Image may lead to an unexpected application termination or arbitrary code execution

  Description: A memory corruption issue exists in the process of handling RAW images. By enticing a user to open a maliciously-crafted image, an attacker can trigger the issue which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of RAW images. This issue does not affect systems prior to Mac OS X v10.4. Credit to Luke Church of the Computer Laboratory, University of Cambridge, for reporting this issue.

- **Kernel**

  CVE-ID: CVE-2006-5836

Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

Impact: Malicious local users may be able to cause a denial of service

Description: Using the fpathconf() system call on certain file types will result in a kernel panic. This has been described on the Month of Kernel Bugs web site (MOKB-09-11-2006). This update addresses the issue through improved handling for all kernel defined file types. Credit to Ilja van Sprundel for reporting this issue.

- **Kernel**

  CVE-ID: CVE-2006-6126

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Executing a maliciously-crafted Mach-O binary may lead to an unexpected termination of system operations.

  Description: An implementation issue exists in the kernel's handling of faults while loading Mach-O binaries. This could allow a malicious local user to cause a kernel panic. This issue has been described on the Month of Kernel Bugs web site (MOKB-23-11-2006). This issue only affects systems with Intel processors. This issue does not allow kernel memory corruption and can not lead to privilege escalation. This update addresses the issue by performing additional validation of Mach-O binaries.

- **Kernel**

  CVE-ID: CVE-2006-6129

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Executing a maliciously-crafted Universal Mach-O binary may lead to an unexpected termination of system operations or arbitrary code execution with elevated privileges

  Description: An integer overflow vulnerability exists in the loading of Universal Mach-O binaries. This could allow a malicious local user to cause a kernel panic or to obtain system privileges. This has been described on the Month of Kernel Bugs web site (MOKB-26-11-2006). This update addresses the issue by performing additional validation of Universal binaries.

- **Kernel**

  CVE-ID: CVE-2006-6173

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Executing a maliciously-crafted program may lead to a system hang

  Description: The shared_region_make_private_np() system call allows a program to request a large allocation of kernel memory. This could allow a malicious local user to cause a system hang. This issue does not allow an integer overflow to occur, and it cannot lead to arbitrary code execution. This issue has been described on the Month of Kernel Bugs web site (MOKB-28-11-2006). This update addresses the issue by additional validation of the arguments passed to shared_region_make_private_np().

- **Kernel**

  CVE-ID: CVE-2007-0430

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Malicious local users may be able to cause a system hang

  Description: The shared_region_map_file_np system call allows a program to request a large allocation of kernel memory. This could allow a malicious local user to cause a system hang. This issue does not lead to arbitrary code execution. This update addresses the issue through additional validation of the arguments passed to shared_region_map_file_np. Credit to RISE Security for reporting this issue.

- **MySQL Server**

  CVE-ID: CVE-2006-1516, CVE-2006-1517, CVE-2006-2753, CVE-2006-3081, CVE-2006-4031, CVE-2006-4226, CVE-2006-3469

  Available for: Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Multiple vulnerabilities in MySQL, the most serious of which is arbitrary code execution

  Description: MySQL is updated from version 4.1.13 to 4.1.22. Further information is available via the MySQL web site at http://dev.mysql.com/doc/refman/4.1/en/news-4-1-x.html

- **Networking**

  CVE-ID: CVE-2006-6130

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Malicious local users may be able to cause an unexpected termination of system operations or execute arbitrary code with elevated privileges

  Description: A memory corruption issue exists in the AppleTalk protocol handler. This could allow a malicious local user to cause a kernel panic or gain system privileges. This has been described on the Month of Kernel Bugs web site (MOKB-27-11-2006). This update addresses the issue by performing additional validation of the input data structures.

- **Networking**

  CVE-ID: CVE-2007-0236

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Maliciously-crafted AppleTalk requests may lead to a local denial of service or arbitrary code execution

  Description: A heap buffer overflow vulnerability exists in the AppleTalk protocol handler. By sending a maliciously-crafted request, a local user can trigger the overflow which may lead to a denial of service or arbitrary code execution. This has been described on the Month of Apple Bugs web site (MOAB-14-01-2007). This update addresses the issue by performing additional validation of the input data.

- **OpenSSH**

  CVE-ID: CVE-2007-0726

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: A remote attacker can destroy established trust between SSH hosts by causing SSH Keys to be regenerated

  Description: SSH keys are created on a server when the first SSH connection is established. An attacker connecting to the server before SSH has finished creating the keys could force the keys then to be recreated. This could result in a denial of service against processes that rely on a trust relationship with the server. Systems that already have SSH enabled and have rebooted at least once are not vulnerable to this issue. This issue is addressed by improving the SSH key generation process. This issue is specific to the Apple implementation of OpenSSH. Credit to Jeff Mccune of The Ohio State University for reporting this issue.

- **OpenSSH**

  CVE-ID: CVE-2006-0225, CVE-2006-4924, CVE-2006-5051, CVE-2006-5052

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Multiple vulnerabilities in OpenSSH, the most serious of which is arbitrary code execution

  Description: OpenSSH is updated to version 4.5. Further information is available via the OpenSSH web site at http://www.openssh.org/txt/release-4.5.

- **Printing**

  CVE-ID: CVE-2007-0728

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: An unprivileged local user can overwrite arbitrary files with system privileges

  Description: Insecure file operations may occur during the initialization of a USB printer. An attacker may leverage this issue to create or overwrite arbitrary files on the system. This update addresses the issue by improving the printer initialization process.

- **QuickDraw Manager**

  CVE-ID: CVE-2007-0588

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

Impact: Opening a maliciously-crafted PICT image may lead to an unexpected application termination or arbitrary code execution

Description: A heap buffer overflow vulnerability exists in QuickDraw's PICT image processing. By enticing a user to open a maliciously-crafted image, an attacker can trigger the overflow which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of PICT files. Credit to Tom Ferris of Security-Protocols and Mike Price of McAfee AVERT Labs for reporting this issue.

- **QuickDraw Manager**

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Opening a malformed PICT image may lead to an unexpected application termination

  Description: QuickDraw Manager has been updated to address the issue described on the Month of Apple Bugs web site (MOAB-23-01-2007), which may lead to an unexpected application termination. This issue can not lead to arbitrary code execution.

- **servermgrd**

  CVE-ID: CVE-2007-0730

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Remote attackers may be able to access Server Manager without valid credentials

  Description: An issue in Server Manager's validation of authentication credentials could allow a remote attacker to alter the system configuration. This update addresses the issue by additional validation of authentication credentials.

- **SMB File Server**

  CVE-ID: CVE-2007-0731

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: A user with write access to an SMB share may be able to cause a denial of service or arbitrary code execution

  Description: A stack buffer overflow vulnerability exists in an Apple-specific Samba module. A file with an overly-long ACL could trigger the overflow, which may lead to a denial of service or arbitrary code execution. This update addresses the issue by performing additional validation of ACLs. This issue does not affect systems prior to Mac OS X v10.4. Credit to Cameron Kay of Massey University, New Zealand for reporting this issue.

- **Software Update**

  CVE-ID: CVE-2007-0463

  Available for: Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: Opening a maliciously-crafted Software Update Catalog file may lead to an unexpected application termination or arbitrary code execution

  Description: A format string vulnerability exists in the Software Update application. By enticing a user to download and open a Software Update Catalog file, an attacker can trigger the vulnerability which may lead to an unexpected application termination or arbitrary code execution. This has been described on the Month of Apple Bugs web site (MOAB-24-01-2007). This update addresses the issue by removing document bindings for Software Update Catalogs. This issue does not affect systems prior to Mac OS X v10.4. Credit to Kevin Finisterre of DigitalMunition for reporting this issue.

- **sudo**

  CVE-ID: CVE-2005-2959

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4 through Mac OS X v10.4.8, Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: A local user with sudo access to a bash script can run arbitrary commands with elevated privileges

  Description: A user-modified sudo configuration could allow environment variables to be passed through to the program running as a privileged user. If sudo is configured to allow an otherwise unprivileged user to execute a given bash script with elevated privileges, the user may be able to execute arbitrary code with elevated privileges. Systems with the default sudo configuration are not vulnerable to this issue. This issue has been addressed by updating sudo to 1.6.8p12. Further information is available via the sudo web site at

http://www.sudo.ws/sudo/current.html

- **WebLog**

  CVE-ID: CVE-2006-4829

  Available for: Mac OS X Server v10.4 through Mac OS X Server v10.4.8

  Impact: A remote attacker can conduct cross-site scripting attacks through Blojsom

  Description: A cross-site scripting vulnerability exists in Blojsom. This allows remote attackers to inject JavaScript into blog content that will execute in the domain of the Blojsom server. This update addresses the issue by performing additional validation of the user input. This issue does not affect systems prior to Mac OS X v10.4.

About the security content of iPhoto 6.0.6

This article has been archived and is no longer updated by Apple.

This document describes the security content of iPhoto 6.0.6, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

iPhoto 6.0.6

- **iPhoto**

  CVE-ID: CVE-2007-0051

  Available for: Mac OS X version 10.3.9, and Mac OS X version 10.4.3 or later

  Impact: Subscribing to a maliciously-crafted photocast may lead to arbitrary code execution

  Description: A format string vulnerability exists in iPhoto. By enticing a user to subscribe to a maliciously-crafted photocast, a remote attacker can trigger the vulnerability which may lead to arbitrary code execution. This has been described on the Month of Apple Bugs web site (MOAB-04-01-2007). This update addresses the issue by performing additional validation while handling photocast subscriptions. Credit to Kevin Finisterre of DigitalMunition for reporting this issue.

Final Cut Pro: Restart Final Cut Pro after sleep to prevent display issues

This article has been archived and is no longer updated by Apple.

Issue

If you put your computer to sleep while Final Cut Pro is running, it's possible that Final Cut Pro may display the content of its windows incorrectly.

Note: If this occurs, your project and media files will be unaffected.

Solution

If the content displayed in Final Cut Pro appears incorrectly after you wake your computer from sleep, save your project, then quit and restart Final Cut Pro.

To prevent this issue from occurring, quit Final Cut Pro before putting your computer to sleep. You can change sleep settings in the Energy Saver pane in System Preferences.

On a portable Mac, the computer will usually go to sleep if you close your computer's display, regardless of the settings made in Energy Saver*.

*For more information about subtleties in sleep and Energy Saver settings, refer to Mac OS X: Why your Mac might not sleep or stay in sleep mode.

This document will be updated as more information becomes available.

WebObjects 5: Updating time zone data

This article has been archived and is no longer updated by Apple.

This article describes a procedure for updating the time zone data for all WebObjects 5 versions. It is not necessary to use this procedure to update the WebObjects 5.3 time zone data.

Time zone data are stored in a file named zoneinfo.zip that may be present on the file system itself as well as in JavaFoundation.jar, javafoundation.jar, and wojavaclient.jar archives. These files are present in various file system locations depending on the WebObjects version and the operating system on which WebObjects is installed. Both WebObjects Developer and Deployment installations should be updated. These files can also be present on standalone Web servers without full WebObjects installations.

To update the WebObjects time zone data, current compiled time zone data must first be archived in a file named zoneinfo.zip. Then all existing instances of zoneinfo.zip must be replaced with this new zoneinfo.zip.

WebObjects applications do not need to be rebuilt to take advantage of the time zone data update.

The follow examples assume that Mac OS X is the operating system and /tmp is your working folder.

Important: The following procedure is known to work with WebObjects 5.2.4 under Mac OS X 10.4 and can be followed similarly for other WebObjects 5 versions on other platforms by experienced system administrators. However, because this procedure has been tested only with WebObjects 5.2.4 under Mac OS X 10.4, it may not work for all WebObjects 5 versions under all platforms. Users who are unfamiliar with the command line interface and manual configuration in general should proceed with caution or, preferably, seek assistance. Assistance in updating WebObjects' time zone data is not part of Apple's complimentary technical support but is included among the benefits of an AppleCare Enterprise Support fee-based support package.

Creating zoneinfo.zip

1. Locate one of the following three sources of compiled time zone data; any will work under Mac OS X, Windows, or Solaris.

    - The most convenient compiled time zone data source is the Mac OS X time zone data in /usr/share/zoneinfo. To incorporate the 2007 Daylight Saving Time (DST) changes, the Mac OS X "Daylight Saving Time Update", offered by Software Update, must have been installed.
    - Other UNIX systems such as Solaris include compiled time zone data. For example, under Solaris 8, compiled time zone data are in /usr/share/lib/zoneinfo. To incorporate the 2007 DST changes, the Solaris time zone data must be version 2007a or later.
    - Download raw time zone data and C source for Zone Info Compiler (`zic`). Build `zic` and use it to compile the raw time zone data. To incorporate the 2007 DST changes, time zone data version 2007a or later must be downloaded. Note that to build `zic` in Mac OS X 10.4 or later, you need to use:
      "`make CFLAGS=-DSTD_INSPIRED`".

2. Create a "zoneinfo.zip" ZIP archive of the contents of the compiled time zone data folder. For example, under Mac OS X in a Terminal window assuming that the com/webobjects/foundation/TimeZoneInfo path exists in your working folder, /tmp, enter these commands, each on a single line:

```
cd /usr/share/zoneinfo
zip -r /tmp/com/webobjects/foundation/TimeZoneInfo/zoneinfo.zip *
```

Updating time zone data

3. Log in with system administrator privileges.
4. Stop all running instances of WebObjects applications, JavaMonitor, and the WebObjects Task Daemon (wotaskd).
5. Replace all zoneinfo.zip files on your system with the new zoneinfo.zip file that you created in Step 2 above.

    - zoneinfo.zip can be in the Web server document folder, in /System and /Library on Mac OS X, and in $NEXT_ROOT/Library and $NEXT_ROOT/Local/Library on Windows and Solaris, where $NEXT_ROOT is the folder in which WebObjects was installed. On Mac OS X, Spotlight will not find all files that need to be updated, so use a utility such as `find` instead. On a standalone Web server without a full WebObjects Deployment installation, the files that need updating will be only in the Web server document folder.
    - Rename each found file with an "orig" file extension to preserve the original in its original folder should you need to revert the update.

6. Replace the zoneinfo.zip file in all JavaFoundation.jar, javafoundation.jar, and wojavaclient.jar archive files.

    - Search for these JAR files in the same file system locations as zoneinfo.zip (see step 5 above).
    - Rename each found file with an "orig" file extension to preserve the original in its original folder should you need to revert the update.
    - Use the jar command line utility (`jar`) to replace "com/webobjects/foundation/TimeZoneInfo/zoneinfo.zip" in each found .jar file with "com/webobjects/foundation/TimeZoneInfo/zoneinfo.zip" created in Step 2 above.
      Extending the example in step 2, to update /Library/WebObjects/lib/JavaFoundation.jar, enter the following statement on a single line

with /tmp as the current folder:

```
jar -uf /Library/WebObjects/lib/JavaFoundation.jar com
```

- The Java versions required by WebObjects 5 should include a jar utility (`jar`) that supports replacement of a component of a JAR archive. But some previous Java versions may not, so use the jar command-line utility (`jar`) included with Java 1.3.1 or later.

7. If WebObjects applications are deployed in self-contained WAR archives, JavaFoundation.jar, javafoundation.jar, wojavaclient.jar in each WAR archive must also be updated using a similar approach.
8. After all updates have been completed, restart wotaskd, JavaMonitor, and all instances of WebObjects applications.

Mac OS X Server 10.4: Installation language determines login window keyboard layout

This article has been archived and is no longer updated by Apple.

Issue or symptom

In Mac OS X Server 10.4, the keyboard layout used at the login window on the server matches the installation language, not the keyboard layout selected in Server Assistant. For example, if you choose English in the Installer, and then choose the French keyboard layout in the Server Assistant, login window will use the US Keyboard layout, not the French keyboard layout.

Solution

To switch to the desired keyboard layout at the login window, follow the steps in "Mac OS X: How to change the keyboard layout at the login window".

Published Date: Oct 10, 2016

Mac OS X Server 10.4: Unable to switch keyboard layouts in input menu

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you choose a keyboard layout in Server Assistant other than the one that matches the language chosen in the Mac OS X Server installer, you cannot switch between keyboard layouts in the input menu (the menu that often looks like a little flag icon).

For example, if you chose English when installing Mac OS X Server, but then choose the French keyboard layout in Server Assistant, when you log into the server after restarting you will have options for both French and US keyboards in the input menu. However, selecting the US flag icon will not change the keyboard layout.

Solution

1. From the input menu, choose **Open International**. This will open the Input Menu tab of the International pane in System Preferences.
2. Uncheck (deselect) the box next to the input method that does not work. ("US" in the example above.)
3. Reselect "Show input menu in menu bar".
4. Quit System Preferences.
5. Choose **Open International** from the input menu again.
6. Reselect the desired input method.
7. Quit System Preferences.

You may now switch between all available keyboard layouts in the Input Menu as desired.

AirPort Extreme (802.11n): WPA Personal password requested when associating via WEP (TSN)

This article has been archived and is no longer updated by Apple.

If you have configured your AirPort Extreme (802.11n) Base Station to use WEP (Transitional Security Network (TSN)), but join the Base Station from a Mac or wireless device that supports WPA, you will be asked to enter your WPA Personal password.

If you join the AirPort Extreme (802.11n) Base Station from a computer that supports WEP only, you will be asked to enter your WEP password.

Note: The password you enter will be the same for either computer. For Mac computers that support WPA it is normal behavior to be prompted for WPA, even though the Base Station is configured to use WEP.

Additional information

The AirPort Extreme 802.11n base station can be configured to allow clients to associate with the wireless network using WEP (TSN), several types of WPA, and WPA2. WPA offers a higher level of security than WEP, but some wireless devices only support WEP.

If you would like to verify that your AirPort Extreme 802.11n Base Station is using WPA or WEP, open AirPort Utility, select your AirPort Base Station, then click the AirPort Summary tab.

iTunes: Motorola phone featuring iTunes may not appear in Source list when connected to MacBook

This article has been archived and is no longer updated by Apple.

This article does not cover iPhone support in iTunes. For more information about iPhone support in iTunes, click here.

Symptom

When connecting a Motorola phone featuring iTunes to a MacBook, the phone may not appear in iTunes Source list.

Products Affected

- Motorola phone featuring iTunes
- MacBook
- MacBook (Late 2006)

Solution

Reinstalling the iTunes Phone Driver should resolve this issue:

1. Quit iTunes.
2. Navigate to the /System/Library/Extensions folder.
3. Open the Extensions folder.
4. Drag the iTunesPhoneDriver.kext file to the Trash.

   Note: You may be prompted to enter your Mac OS X administrator name and password when moving this file to the Trash. Enter your name and password if so prompted and click **OK**.

5. Download the latest version of iTunes.
6. Perform a custom install of iTunes and ensure that only "iTunes Phone Driver" is checked as shown below.

7. Restart the computer when prompted.

Some photos may not be rotated correctly when viewed on Apple TV

This article has been archived and is no longer updated by Apple.

Photos that were originally saved using iPhoto version 4 (or earlier) and taken with a camera that saves rotation information may not display correctly on Apple TV. The photo looks fine in iPhoto, but Apple TV may rotate the photo twice when presented with this type of rotation information.

To correct this behavior:

1. Locate and select the photo in iPhoto.
2. From the **Photo** menu, choose **Revert to Original**.
3. In iTunes, resync the corrected photo onto your Apple TV.

Apple Studio Display 15-inch LCD: Video Anomalies When Changing Resolutions

I have an Apple Studio Display 15-inch LCD and when I change resolutions, either through the control strip or from the Monitors and Sound control panel, my screen will either display vertical bars, a checkerboard pattern or go black for a few seconds before displaying the selected resolution. Is this normal?

This article has been archived and is no longer updated by Apple.

Yes, this is normal operation for any multiple resolution display. The display will show different video anomalies such as lines, checkerboard patterns, or may go black for a second in order for the video circuitry to switch to the selected resolution.

Published Date: Feb 20, 2012

QuickTime: Some applications don‘t launch after updating to QuickTime 7.1.5 in Mac OS X 10.3.9

This article has been archived and is no longer updated by Apple.

Issue or symptom

Certain third-party applications may no longer open or unexpectedly quit on when opening after updating to QuickTime 7.1.5 in Mac OS X 10.3.9. Affected applications include (but may not be limited to) FaxSTF, World of Warcraft, TurboTax 2006, and Full Tilt Poker.

The Console log may show the following error message:

```
Error locating symbol - dlcompat: Symbol "_JVTDecoOpen" not found
```

Solution

If you have a critical need to use one of these applications, choose one of the following:

- Perform an Archive and Install, preserving user and network settings, then apply all necessary updates with the exception of QuickTime 7.1.5.
  or
- Download and install QuickTime 7.2.

iBook G3 and G4: Power consumption and thermal output (BTU) information

This article has been archived and is no longer updated by Apple.

Learn about the power consumption and thermal output of iBook computers.

iBook G3 and G4 12-inch or 14-inch
All models with 45 or 65 Watt Wall Adapter

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
13 W	53 W	44 BTU/h	181 BTU/h

Notes

1. Power consumption data (Watts) is measured from the wall power source and includes all power supply and system losses. Additional correction is not needed.
2. "CPU Max" is defined as running a compute-intensive test application that maximizes processor usage with battery in charge mode and is therefore maximum power consumption of the computer plus losses of the power adapter.
3. These numbers reflect power adapter maximum power consumption operating within ambient temperature range of 50° F to 95° F (10° C to 35° C).

Published Date: Feb 20, 2012

Sleep issues or a kernel panic may occur if a storage device is mounted via a PCI card that doesn‘t support sleep

This article has been archived and is no longer updated by Apple.

Issue or symptom

Issues may occur when waking the computer from sleep if a storage device is connected to a PCI or PCI/e card that doesn't support sleep, and its volume is mounted in the Finder:

- The computer may not wake
- A kernel panic may appear
- The computer may wake, but this alert message may appear, and the connected storage device will no longer be available (mounted):

  "**Device Removal**
  The device you removed was not properly put away. Data might have been lost or damaged. Before you unplug your device, you must first select its icon in the Finder and choose Eject from the File menu."

Products affected

- Desktop Macs with PCI/e expansion slots (such as Power Mac G4, Power Mac G5, and Mac Pro computers)
- PCI expansion cards with USB 2.0 ports
- PCI expansion cards with FireWire ports

Solution

Connect the storage device(s) to your Mac's built-in USB or FireWire port instead of through a PCI card. The internal bus should retain a physical connection to the device during sleep, as long as the device is FireWire/USB 2.0-compliant.

You should not connect storage devices--such as USB drives or FireWire drives, memory card readers, and other storage devices that are mounted as volumes in Finder--to PCI cards, unless the card is designed to prevent the computer from sleeping. PCI bus power is normally turned off in sleep mode; storage devices will be disconnected from Finder when this occurs, which may prevent the Mac from waking from sleep for several minutes (or at all).

Alternatively, you can use Energy Saver preferences in System Preferences to disable computer sleep. Move the "Put the computer to sleep when it is inactive for" slider to "Never". However, this would not prevent the computer from attempting to sleep if **Sleep** were chosen from the **Apple** menu.

Note: This issue does not affect devices such as printers, scanners, and other non-storage device because they do not "mount" in Finder. These devices re-enumerate when the computer wakes up. Some printers include media card readers, which may appear in the Finder as a storage volume. If the printer is connected to a PCI expansion card's USB or FireWire port, and the is card media mounted in Finder, the media's volume will be unmounted when the computer sleeps.

Additional information

Peripheral Component Interconnect (PCI) or PCI Express (PCI/e) cards allow you to customize your Mac for the special needs of your workflow. Adding PCI or PCIe cards can provide additional power and productivity by means of video cards, video management, RAID controllers, network cards, or more.

Apple TV: Syncing time and streaming performance dependent on the speed of wireless network

This article has been archived and is no longer updated by Apple.

Syncing and streaming audio and video is much more demanding on a wireless network than browsing web pages or transferring small files.

The better your network performance is, the better your Apple TV experience will be. Note that the network will only be as fast as the slowest device. While Apple TV supports 802.11n, if your computer only supports 802.11b, then the network connection will work at 802.11b speeds.

There are a number of ways to optimize your wireless network performance. Wireless networks can be subject to interference from a number of sources. Obstructions built into walls and other structures can have a negative impact as well.

See this document for some help understanding interference and obstruction issues.

In optimizing your home network, the first place to start might be the location of your wireless access point or base station. Placing your wireless access point in a location with as few sources of interference and obstructions results in better performance.

The same interference and obstructions rules apply to the iTunes computer that contains the content you are syncing or streaming. If you are trying to sync or stream from a location where networking impediments are present, you may encounter longer syncing times and poor streaming performance.

Here are some things to check to see if your host system is in a good wireless location.

- If you are on a Mac, open Internet Connect (located in /Applications). The number of bars indicate the robustness of your networking connection. Move to a location where you have the maximum number of bars for the best performance.
- On a Windows-compatible computer, check the wireless icon on the bottom right hand corner of your screen. Move your cursor over the icon to see if you have Excellent signal strength. Left-click on the icon to obtain a more detailed display. Move to a location where your strength is the highest for best performance.

Finally, the location of your Apple TV unit is subject to the same interference and obstruction issues as the access point and iTunes host computer. Try to eliminate interference and obstructions as much as possible in that location or use a wired connection to your wireless access point if possible.

Mac OS X 10.4.9: Media Eject key delay

This article has been archived and is no longer updated by Apple.

Issue or symptom

After installing Mac OS X 10.4.9, pressing the Media Eject key on the Apple keyboard does not immediately eject media from the optical disc drive nor display the on-screen eject symbol.

Solution

To prevent accidentally ejecting media, Mac OS X 10.4.9 adds a slight delay to the Media Eject key before it takes effect. To eject a disc, hold the Media Eject key. The disc will eject normally and the eject symbol will appear.

This document will be updated as more information becomes available.

iMovie HD 6: "Pop" or "Beep" noise when selecting iSight

This article has been archived and is no longer updated by Apple.

Issue or symptom

When selecting the iSight camera to record in iMovie, you may hear a "pop" or "beep" noise.

Solution

You can safely ignore the short feedback loop you experience when selecting iSight camera to capture source in iMovie. This does not indicate a hardware issue with your computer. Simply wait for the momentary feedback to stop before you continue to record with iSight from iMovie.

Apple TV does not play purchased content after "deauthorize all"

This article has been archived and is no longer updated by Apple.

If you Deauthorize All in your iTunes Store account, purchased content may no longer play on Apple TV.

To correct this, deauthorize and then re-authorize the computer that you sync Apple TV with.

1. In iTunes, choose **Store > Deauthorize Computer**.
2. Then choose **Store > Authorize Computer**. Enter your account login and password if prompted.
3. Select your Apple TV in the Source list and choose **File > Sync Apple TV**.

Boot Camp Beta 1.2: Windows XP (SP2) unable to connect to 802.11n wireless router or AirPort Extreme (802.11n) Base Station

This article has been archived and is no longer updated by Apple.

Issue or symptom

With Boot Camp Beta 1.2, you may not be able to associate your Intel-based Mac to an AirPort Extreme (802.11n) Base Station, or any other 802.11n-based router using Windows XP (SP2). This can happen when the configuration is set to use 802.11n (5 GHz) and authentication uses WPA2 (in Security settings).

Solution

Microsoft has acknowledged this issue with Windows XP and has a fix available. Follow the steps in Microsoft "hotfix" 893357.

Warning: Boot Camp Beta is preview software licensed for use on a trial basis for a limited time. Do not use Boot Camp Beta in a commercial operating environment or with important data. You should back up all of your data before installing this software and regularly back up data while using the software. Your rights to use Boot Camp Beta are subject to acceptance of the terms of the software license agreement that accompanies the software.

Important: Apple does not provide technical phone support for using Boot Camp Beta, burning the Macintosh Drivers CD, or installing Windows. Support is available on Apple's website. Fee-based support agreements are not available for Boot Camp Beta.

Where do I set my computer‘s name for Apple TV?

This article has been archived and is no longer updated by Apple.

Use these steps to change the shared name of your iTunes library when it appears as a source for syncing and streaming data on your Apple TV.

1. On your computer, open iTunes preferences (In Windows choose **Edit > Preferences** . On a Mac choose **iTunes > Preferences**).
2. Click General.
3. In the field labeled "Shared Name," enter the name you would like to appear.
4. Click OK.

The name you entered is what will appear on your Apple TV under Sources.

If you want to change the name of your Apple TV, double-click the name in the Source list in iTunes and type the new name.

Apple Studio Display 15-inch LCD: No Video After Adjustment

I am using an Apple Studio Display 15-inch LCD with a Power Macintosh and when adjusting the screen position, via the Monitors and Sound control panel, my display lost video and went black. Is there a way to restore the video without restarting my computer?

This article has been archived and is no longer updated by Apple.

Yes, if you encounter a situation where you loose video after adjusting the display through the Monitors and Sound control panel, simply press and release the reset button on the bottom left corner on the front of the Apple Studio Display. The reset button is recessed and is labeled on the front of the display with the arrow pointing left .

Apple TV: Where to find the Ethernet and wireless ID

This article has been archived and is no longer updated by Apple.

For some network configurations, you may need to know the Ethernet or Wireless ID* of your Apple TV. On Apple TV, you can find the network address using the following:

- Software version 1.x: **Settings > About**
- Software version 2.0: **Settings > General > About**

The Apple TV network IDs (both Ethernet and wireless) can also be found on the UPC label on the Apple TV box. This is the same label that lists the serial number for your Apple TV.

*** What is the Ethernet or Wireless ID?**

The Ethernet or wireless hardware address (also called a Media Access Control address or an IEEE MAC address) is a number that uniquely identifies a computer that has an Ethernet (or wireless) interface. It is typically written as six hexadecimal numbers separated by periods or colons, for example, "00:80:0:2:20:ef".

Boot Camp Beta 1.2: Mac may not transition from Standby to Hibernate in Windows XP

This article has been archived and is no longer updated by Apple.

Issue or symptom

Two-button mice, such as the Apple Mighty Mouse, may prevent Microsoft Windows XP hibernation on an Intel-based Mac, even though hibernation is enabled in the Power Options Control Panel.

Solution

If you have a multi-button mouse device connected to your Mac, and hibernation in Windows XP does not work as expected, disable the power management setting "Allow this device to bring the computer out of standby".

Follow these steps while booted in (started from) Windows XP with the multi-button mouse connected to the computer:

1. Select Start > Control Panel.
2. Click the Performance and Maintenance category.
3. Select the System Control Panel icon.
4. Click the Hardware tab in the System Properties dialog box.
5. Click the Device Manager button.
6. Expand "Mouse and other pointing devices".
7. Double click HID-compliant mouse.
8. Click the Power Management tab in the HID-compliant mouse Properties window.
9. Deselect "Allow this device to bring the computer out of standby".
10. Click OK.

Additional information

For additional information about Hibernate in Windows XP go here, and search on "Hibernate".

Warning: Boot Camp Beta is preview software licensed for use on a trial basis for a limited time. Do not use Boot Camp Beta in a commercial operating environment or with important data. You should back up all of your data before installing this software and regularly back up data while using the software. Your rights to use Boot Camp Beta are subject to acceptance of the terms of the software license agreement that accompanies the software.

Important: Apple does not provide technical phone support for using Boot Camp Beta, burning the Macintosh Drivers CD, or installing Windows XP. Support is available on Apple's website. Fee-based support agreements are not available for Boot Camp Beta.

Apple Studio Display 15-inch LCD: Vertical Dark Bars At Startup

I have an Apple Studio Display 15-inch LCD that I just connected to my Power Macintosh CPU and noticed that there are dark bars running vertically down the screen when I started the computer. Is this an issue with my computer or my display?
This article has been archived and is no longer updated by Apple.
The dark bars that you are seeing are due to the tracking settings which need to be adjusted. To adjust the tracking for the Apple Studio Display you will need to install the Apple Display Software which shipped on a CD with your display or install Apple Displays 1.7.1 software <**http://www.info.apple.com/swupdates**> .

Adjusting Tracking

1) Install the Apple Display software.

2) Either select the control button on the bottom of the display or select the Monitors & Sound control panel from the Apple menu.

3) If using the control button, select the course tracking icon or the fine tracking icon.

4) In the Monitors & Sound control panel, select Flat Panel.

Figure 1, Monitors & Sound control panel

5) Click Tracking and adjust the tracking until the dark bars are not visible or until the screen appears smooth. You will need to adjust the Coarse adjustment first and then the Fine adjustment.

Figure 2, Tracking window

Artbox Configuration

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

Network Configuration

Access to lds from Java clients

The java clients need direct access to the LDS for data transfers. `/usr/artbox/conf/artbox.conf` contains the configuration for `LDS_ADDRESS`. This must be set to the IP address of the ethernet interface (found by using ifconfig).

Changes to `artbox.conf` are not read until the storeserver is restarted using:

```
service artbox restart
```

Webstart

The artbox http server runs on port 80. It is important that the apache ServerName is an address or hostname that can be resolved by remote machines, as it is used by the webstart php scripts to create a url. This can be achieved by having an entry in `/etc/hosts` of the hostname resolving to the IP address of the external network interface (see above), or manually by adding the ServerName directive to `/usr/artbox/conf/httpd.conf` (and restarting httpd). It should be possible to use an IP address as the ServerName if isn't possible to edit the local hosts file of the client.

To access the java client via webstart, browse the following the url:

```
http://<artbox>/artbox
```

Changes to `httpd.conf` are not read until the storeserver is restarted using:

```
service artbox restart
```

Artbox Licence

To install an artbox license, upload the file to your server and run the following command:

```
px_lic upload < <licence_key_file>
```

Be sure the date on the server is correct since if the date is accidentally set too early, a license created for today's date will not work.

Artbox Configuration

This section describes how to configure an artbox system from scratch, as well as how to re-initialise the database so that from-scratch configuration can be done on an existing system.

Note: ab_config usage is printed out when it is run with no arguments.

Devices, copy templates and analyse params

1. Create some devices. Use the javaui for this. The standard devices for a demo artbox should be:

   ```
   # ContentBase: [artbox Content] (/home/cb1)
   # Filesystem: [artbox Watchers] (/home/media/artbox_watchers)
   ```

   The creation order of devices is important, because each device is assigned an id starting at 1 from the time the database is first initialised, so in this case, artbox Content will have address `/dev/1` and artbox Watchers will have address `/dev/2`.

   Note: Whenever an entity (device or subscription) is created using ab_config, the address of the newly created entity is output by `ab_config`. `ab_config` can be found in `/usr/artbox/sbin`.

2. Create "standard" templates.

   ```
   ab_config --mode copy_templates
   ```

3. Configure analyse params.

```
ab_config --mode analyse_params --params /usr/artbox/conf/artbox_params
```

Note: steps 2 and 3 may be performed as many times as desired without starting from scratch.

If artbox has order management enabled the following steps are required for assets to be attached to orders.

```
ab_config --mode attach_sub_response
ab_config --mode srcattach_sub_response
```

Permitted templates

To allow all copy templates for a particular device, instead of configuring them manually in the java ui, this may be done using ab_config, e.g:

```
ab_config --mode permitted_templates --addr /dev/2
```

Note: the preferable thing to do now is use the Java UI for this (in the Administration/Template tab)

Rebuilding the database from scratch

```
artbox stop
/usr/artbox/sbin/ab_initdb --reinit
```

All the data needs to be purged from any contentbase devices that were configured (and are to be reconfigured with the same root path), so for each contentbase device, do:

```
cd <path to contentbase device>
rm -rf *
artbox start
```

Obviously this process will erase all your database configuration and data files which reside in contentbase devices.

Direct database queries

To access the artbox database directly, do:

```
psql px pxdb
```

More ab_config Tricks

Getting a list of devices

The easiest way to find out the address of a particular device is to use ab_config to search for devices:

```
ab_config --mode search --addr /dev
```

Because this output is rather overwhelming, and you might want to find a single device of a particular name, you can do the following:

```
ab_config --mode search --addr /dev | grep "DEVICE_NAME = artbox Content"
```

Which will show the device details for the device called "artbox Content."

Samba Configuration

After you finish configuring the artbox, you must configure Samba.

Proximity Artbox Software Architecture Overview

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

Artbox consists of a set of servers that communicate with each other by sockets (either TCP or Unix), and several clients. Each server is a single-threaded process written in C++ and using an asynchronous mode of operation. As far as possible all I/O is non-blocking. Artbox makes extensive use of the STL class and template library.

The major components of artbox are:

Storeserver

A server which handles the asset management role. It manages storage of media assets and metadata in the database. The storeserver is the main application server, in that most clients connect to the storeserver, and not to other components.

LDS

The Local Device Server is a server which handles communications with other devices and coordinates media operations such as transcoding. It knows nothing about the database. The storeserver sends requests to the LDS to perform device and media functions. It has implementations of a variety of network protocols.

Clipcopier

To perform video transcodes, the LDS starts up a clipcopier process for each transcode job. The clipcopier can either run locally on the same host as the LDS, or it can be configured so that a number of machines are available for running clipcopier jobs, using inetd.

OMS Server

The Order Management System server manages most aspects of the workflow state of orders. The OMS is still in transition from the previous PHP-only architecture, so some functions are still performed by PHP talking directly to the database. The direction Artbox is taking is to move database-access functions to the OMS server, so artbox has a single point of contact with the database for workflow operations.

Java UI

The main client for artbox is written in Java. It communicates with the Storeserver, sending requests and interpreting the responses.

PHP UI

There is also have a PHP client for artbox, so that artbox can be accessed via web pages. This is currently primarily used in parts of the Order Management system and the Newsroom system.

Newsroom Plugin

The newsroom plugin integrates with both iNews and ENPS newsroom systems, allowing news producers to both search for assets in the Storeserver and perform workflow functions in the OMS.

External components

- postgres
- quicktime
- ligos
- ffmpeg
- libjpeg
- libpng
- libtiff
- apache
- php
- libxml2
- mxflib
- ruby
- wine

- XMP toolkit

extensible metadata sets

Artbox's pxmodel and database schema allows complete customisation of what metadata fields particular types of entities will have.

Artbox Custom Data Definition

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

The scripts which artbox uses to configure the data as shipped can also be used to set up data required specifically for a particular customer.

The basic procedure is to create a new file in CSV (comma-separated value) format, which can be maintained by most spreadsheet programs, and create a new `initdata.conf` file. Details vary depending on what sort of data requires the customisation. These files must be located in:

```
/usr/artbox/sql/custom
```

Once you have the data set up, you can get your changes into the database by running:

```
/usr/artbox/sbin/ab_initdb
```

Depending on the type of data, you can get updates propagated to the database by running that script again after editing the data files. Just be aware that in most cases, we don't attempt to capture changes to user-modifiable data, as we want to avoid clobbering anything someone may have done using the artbox ui itself. However we do capture additions of new fields etc.

Configuring an initdata.conf file

The initdata.conf file can normally be found in `/usr/artbox/sql` on a production artbox system. It provides instructions as to which data files should be processed using which scripts. An example of what a current (at time of writing) one looks like is:

```
# $Id: initdata.conf,v 1.5 2004/10/21 06:55:41 ben Exp $
#
# Config file for initdata.rb. The first column is the table name, the
# second is a list single character flags and the third is an optional
# ruby sub-script. Flags are:
#
# g - .dat file must be generated from a .def file
# d - a .dat file is processed directly by the ruby script
# r - use script in 3rd colum to insert data rather than a direct copy
#
# The r flag takes precedence over c and only works if a script is
# specified. If the r flag is specified on its own, then the .def file
# is read directly by the .rb script
#
# Columns must be tab separated

# <table name>  <flags>  [script]
pxtraitclass  gr  insTraitClass.rb
pxuser   rd  insUser.rb
pxgroup   rd  insGroup.rb
pxgrouphasuser  rd  insGroupHasUser.rb
pxschema  gr  insSchema.rb
pxentitylinktype gr  insEntityLinkType.rb
pxenum   r  insEnum.rb
pxenumentry  r  insEnumEntry.rb
pxmdfield  r  insMdField.rb
pxtrait   gr  insTrait.rb
pxmdgroup  r  insMdGroup.rb
pxmdgrouphasfield r  insMdGroupHasField.rb
pxmdmap   r  insMdMap.rb
pxeventstatus  gr  insEventStatus.rb
```

The comments at the top explain the flag codes reasonably well. For each sort of data file, you could create a new data file of the appropriate type, and add a line to this file, using the script appropriate to the type of data.

You will need to create your own initdata.conf file inside the custom directory. The database update script will detect this file and execute it's contents.

Metadata Fields

The script which processes metadata fields is `insMdField.rb`. The data file needs to have fourteen columns, interpreted as follows:

- **`;fieldid:`** a unique concise text name for the field id, must be unique among all metadata fields
- **`;name:`** a name for the field
- **`;datatype:`** the data type, the name of a Kt-type, examples are KtInt, KtString, KtString32, KtDateTime, KtIntXY, PxTimecode,

KtBool

- **;description:** a description for the field, this is used in roll-over text
- **;rangemin:** if the field is of a numeric type, and the values are to have a lower limit, enter the value, otherwise enter null
- **;rangemax:** for numeric fields, the upper limit, if any, otherwise null
- **;suffix:** a text suffix to appear after the value in the user interface, eg units for a measurement
- **;removable:** t for true, f for false, whether or not it should be possible for the admin to remove this field definition in artbox, usually t
- **;definable:** t/f, whether or not to allow editing of the definition of this field in artbox, usually t for a custom field
- **;enumid:** if the values of this field are to be taken from an enum (aka look-up), the text id of the enum, otherwise null
- **;defaultvalue:** the default value for the field, if any, otherwise null
- **;fieldcategory:** a flag to indicate whether the field has any special meaning, usually 0 for custom fields
- **;mdgroupcategoryid:** for custom metadata, this should always be custom
- **;hints:** display hints to the user interface, see other fields for examples, leaving this blank is a good default

Metadata Group

Metadata groups are inserted with the insMdGroup.rb script. The data file has nine columns, as follows:

- **;mdgroupid:** a concise text id for the md group, unique among all metadata groups
- **;name:** the name of the md group
- **;trait:** which trait this md group corresponds to. For asset metadata, this will usually be either "asset", if the field should apply to all assets, or the specific name of the trait for an asset type (eg asset_graphic, asset_animation)
- **;removable:t/f,** whether this md group should be removable in artbox, usually t
- **;definable:t/f,** whether the configuration of this md group should be modifiable in artbox, usually t
- **;action:** a comma-delimited list of actions where this md group will apply, for example view details,edit details,create
- **;mdgroupcategoryid:** the category of md group, usually custom for custom md
- **;priority:** a number that determines the order of appearance of the tab for this md group, a higher number means it appears further to the right, ie after other fields. In practice 10 is about the highest number you'd want to use here.
- **;hints:** a set of values giving hints to the user interface about how to display this md group, blank is a good default

Metadata Map

Metadata maps are inserted with the insMdMap.rb script. The data file has three columns, as follows:

- **;fieldid1:** field ID of the source field to be mapped from
- **;fieldid2:** field ID of the destination field to be mapped to
- **;priority:** map priority. if more than one field id maps to the same field id, the map with the highest priority will take precedence. the higher the priority number, the higher the map priority.

Setup

Once you have a correctly formatted CSV document, the following preparations should be completed when importing data:

1. Copy the CSV document to `/usr/artbox/sql/custom`
2. Convert the line endings of the CSV document to Unix-style endings ('\\n'), if required
3. Remove any blank rows
4. Ensure that certain characters are correctly escaped for the database, single quote entries ' should be escaped to \\'
5. Add an entry to `/usr/artbox/sql/custom/initdata.conf` to reference the customer specific metadata.

   For example, if you have custom field metadata in a CSV document named "`/usr/artbox/sql/custom/mystation-md.csv`", then run the following command:

   ```
   mystation-md
   r
   insMdField.rb
   ```
6. Ensure that artbox is not running by running `artbox stop`
7. Run the update script and check to see if there are any error messages

   ```
   /usr/artbox/sbin/ab_initdb
   ```
8. Restart artbox by running `artbox start`

Artbox Diagnostics

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

There are various tools available to help diagnose the artbox storeserver.

Database Deadlocks

With multiple database sessions it is conceivably possible for two database sessions to deadlock each other because they both perform queries that require the database to acquire particular locks. And it is not possible to satisfy either, for example one session has a lock on A and wants a lock on B, the other session has a lock on B and wants a lock on A. Postgres will normally detect this condition after a short period and fail one query with an error, allowing the other to proceed, so in practice it's most likely that you'll just see the occasional error that reports a deadlock.

To view a database session deadlock you can use:

```
ps ax | grep postgres
```

This lists all current running postgres processes. Each process has a short description of what its currently doing in the ps output, which will be one of "idle" (ie. no query pending), "idle in transaction" (ie. a transaction has been started on this connection, but it's not currently processing a query) or actual SQL command (ie. SELECT, INSERT, etc).

If you see two connections that have the same SQL command state for a long period of time, that might be a deadlock. You would need to wait quite a long time, polling `ps` all the time, to be certain of that. If the deadlock doesn't resolve itself, then restarting the storeserver should fix it.

Internal Storeserver Deadlock

Much more common are internal storeserver deadlocks. The storeserver usually has multiple requests being serviced at once, and so has its own system of avoiding inconsistent simultaneous updates—it has its own locks, which can be a source of deadlock contention. The other sources of deadlock contention are the database connections and the connection to LDS.

If a particular request seems to have just stopped, a deadlock might be responsible.

You can get some idea of what is happening with `ps ax | grep postgres`, as before. Sometimes you can tell if there's a deadlock if one or more connections are noted as "idle in transaction." This might mean that whatever task within the storeserver that should be sending the next request to that connection is waiting for something else. The somethings else it might be waiting for include a database connection, which might be waiting for a database lock it can't get now, another internal lock, or an LDS request. However, it is possible for a deadlock to happen that does not involve the database, so don't rely on `ps` for the whole story.

If a deadlock happens, the best way to diagnose what is actually happening is to dump the state of the storeserver, which you can do using:

```
ab_config --mode dump_state
```

This will produce a file pms_state.dump in the working directory of the storeserver executable (on a production artbox this is normally /usr/artbox/logs) which contains a complete description of all the things going on inside the storeserver at that instant, all the tasks and subtasks, what they are doing, what locks they have, what locks they are waiting for, whether they have a database query in progress, whether they are inside a database transaction, and whether they have an LDS request in progress.

This command will now also get LDS to produce a similar dump file, which is useful for diagnosing any problems where LDS seems to be not responding, or seems to be doing some stuff but just ignoring others. The LDS dump file is called lds_state.dump and is written to the LDS working directory, which on a production artbox is also /usr/artbox/logs.

The file is laid out as an indented hierarchy, so you can see which tasks are children of other tasks. Generally speaking, a task will complete after all its children have completed, so any task that has children is likely to be waiting for one or more of its children to do something.

To fix a deadlock, restart the storeserver. Make sure to capture the state dump before restarting for further troubleshooting.

Artbox Hardware Requirements

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

Artbox Hardware Specifications

Current machine specifications for 'single box' artbox call for a machine with the following:

Processor
- 2 x 3.2 GHz Intel Xeon processors[1]

Memory
- 2 GB

Disk
- 2 x 36 GB 15,000 RPM disk in RAID 1 configuration for the system and database, this can't be used for media or artbox "tmp"
- *n* x *y* GB 10,000 RPM disk in RAID 5 configuration for media subsystem and artbox "tmp" (eg. 4 x 143 GB 10,000 RPM disks)

RAID Controller
- RAID controller with two channels

Network
- 2 x 1000Base-T NICs

For details on hardware and software for an artbox failover (high availability) solution, see artbox failover solution.

Performance Options

For an extra performance boost, the 10,000 RPM SCSI disks can be replaced with 15,000 RPM models. This would be more suitable with machines with high throughput. Also, the RAID controller could be replaced with a PCI-X model.

Artbox Still Sequence Support

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

This page discusses the capabilities of artbox to support "still sequences" and "composite clips."

Currently, artbox only support poll watching and monitoring, but not scanning, of "still sequences." You can create a poll watcher to watch for entity type "still sequence."

Artbox supports copying from a stillseq plus audio composite clip to anything. This is performed by searching and watching a device for entity type composite clip.

Artbox supports copying from a clip to a "still sequence." This is performed by creating a template which has a wrapper format of "still sequence" with one video track.

Artbox supports copying a clip to a composite clip which can be a "still sequence" clip plus an audio clip. The template editor now supports creating these double wrapper templates.

Artbox does not support copying to a "still sequence" and creating an asset from it. This is true for all destination device types.

Artbox: Edit In Place

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

Important: If upgrading from a version of artbox prior to 3.2.6, make sure you follow all the upgrade notes for each intervening release.

"Edit-in-place" allows users to directly access asset "primary representations" through artbox. This functionality is only available to clients running on Mac OS or Windows. Filesystem, Contentbase, SMB, NFS and FTP devices are supported. For a client to make use of this functionality is must be able to make an smb share to the root of the given device.

Configuration

Supported devices now have two new fields, "Macintosh EIP URI" and "Windows EIP URI". These fields should be "file:" URI paths that point to the base of the associated device (usually smb paths).

A Mac path will look similar to: file://Volumes/PROXIMITY;TRINITY/devices/fs1.
A Windows path will look similar to: file://trinity/gavin/devices/fs1.

Currently the mount on the mac has to be manually mounted. There is also a new security action "Edit Media" that can be configured for each user group.

The client

There are two ways you can use the "Edit-in-place" functionality in the Java UI.

"Edit Media"

If the Java client supports EIP for a given asset the "Edit Media" option will be available in the asset context menu. When you select this option the source file will be opened with a native application associated with the source file type.

"Drag n Drop"

Click the area below the asset that says "Click here to access" If the task bar says "Drag to application (original)" you are able to drag the asset source to an application in your client (ie. Edit-in-place). if the task bar says "Drag to desktop (copy)" you only have a copy of the original asset source (ie. no Edit-in-place).

Artbox Database Backup

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

Important: If upgrading from a version of artbox prior to 3.2.6, make sure you follow all the upgrade notes for each intervening release.

Artbox Database Backup, Recovery and Failover

As of version 1.0.6 of the pxpginstall package, there is built-in support for backup and point-in-time-recovery of the postgres database. Documentation of how it works follows.

As of version 1.0.9 it also supports failover to a standby database using PITR.

Backup & Recovery

What you can achieve with the backup system provided here is to be able to recover from losing the main database storage, or from a severe database corruption, or even from a catastrophic user error. The advantages it has over using pg_dump are that you should be able to get back online in minutes, rather than hours, and you should be able to get back to a very recent state of the database, such as to within seconds before losing the database, rather than just to the last time you did a dump.

Failover

The failover support provided here lets you set up a dedicated standby database server (the secondary), which will keep itself busy keeping up to date with the primary. The database on the secondary will not be available for use while it is in standby mode.

If anything goes wrong with the primary, or it's necessary to shut it down for whatever reason, the secondary can be brought up and running in a state identical to the state the primary was in when it went down. The process of bringing the secondary up should be very quick (seconds after someone initiates it).

PITR

PITR (Point In Time Recovery) is a postgres feature which allows recovery of a database to a particular point in time by using the write-ahead-log (WAL) files. The WAL keeps a record of every transaction, and its initial intended use was for robustness against power failures and the like, so that the database can ensure reliability by syncing just the one file (such as the WAL file) to disk, rather than having to endure the cost of syncing all its open files to disk all the time. If a database goes down unexpectedly, for whatever reason, next time it starts up it tries to recover by playing forward whatever WAL files it can find. This feature can also be used to recover in other circumstances, allowing us to do both backups and failover.

Configuration

The configuration of both backup and failover is set up in the file `/var/lib/pgsql/pitr.conf`.

An example of its contents follows:

```
# $Id: pitr.conf,v 1.1 2005/09/09 05:52:27 tim Exp $

# A set of variables used to configure the use of PITR for
# backup and/or failover
# This file consists of a set of variable assignments, of the form
# <variable>=<value>
# note the lack of space around the equals sign

# do we want pitr backup enabled? 1 or 0
PX_DB_BACKUP_ENABLE=1

# path to archive, where we put the backup wal files
PX_DB_ARCHIVE_PATH=/var/lib/pgsql/backups

# path of the directory above the database directory
PX_DB_DATA_PATH=/var/lib/pgsql

# name of the database directory
PX_DB_DATA_DIR=data

# do we want failover enabled? 1 or 0
PX_DB_FAILOVER_ENABLE=1
```

```
# where we (the primary) write wal files so they can be fed to the secondary
PX_DB_FAILOVER_WRITE_PATH=/var/lib/pgsql/failover_write

# where we read wal files from if we are the secondary
PX_DB_FAILOVER_READ_PATH=/var/lib/pgsql/failover_read
```

The comments in the file are hopefully reasonably explanatory. Note that backup and failover can both be enabled or disabled independently. Set the corresponding variable to 0 to disable it.

For backup, the location to store backup files can be altered from the default if desired if you may to put the files on some remote networked storage.

For failover, both primary and secondary machines need a version of this file. The PX_DB_FAILOVER_WRITE_PATH is where the primary will put its failover files. The PX_DB_FAILOVER_READ_PATH is that very same directory, but as viewed from the point of view of the secondary. The secondary will read failover files from that directory.

Enabling PITR

PITR is enabled using the archive_command postgres configuration setting. If no form of PITR is being used, that should be set to `archive_command=''` in postgresql.conf.

To enable it, set it to `archive_command = '/usr/sbin/pitr_archive_wal.rb %p %f'`

Restarting the database server is required after changing this setting (which of course also requires shutting down artbox in the meantime).

As it is now possible to disable backup and/or failover in the pitr.conf file, you could keep PITR enabled in the archive_command setting as above, but disable both backup and failover in the pitr.conf; this wouldn't be too bad, it would just mean that pitr_archive_wal.rb script would be run every now and then and would do nothing.

To enable backup, enable pitr as above and set PX_DB_BACKUP_ENABLE=1 in the pitr.conf file. To enable failover, set PX_DB_FAILOVER_ENABLE=1 in the pitr.conf file. Set them to 0 to disable them.

Performing a Backup Snapshot

Periodically, such as a nightly cron job, the postgres data directories should be backed up. The script `/usr/sbin/pitr_backup.sh` when run as user postgres will do this job. Sometimes tar will emit complaints to the effect that some file or other changed while it was reading it—this is entirely expected.

This script will always make the backup snapshot (even if backups are disabled). If failover is enabled, it will also copy the snapshot to the failover directory. In other words, if you want failover but don't want backups, you have to run this script anyway, and you will get backup snapshots made.

Purging Old Backups

Old backup files can be purged using /usr/sbin/pitr_purge.rb which should also be run from cron. It accepts an optional argument, the number of days of data to keep. If you don't specify, it defaults to seven so that it throws out anything older than seven days. This script could be run either as root or as postgres.

Thought needs to be given about how long files should be kept for. If the ability to restore to some very ancient state is required, then separate provision needs to be made to copy selected snapshots somewhere where they will be archived.

Restoring from Backup

If you had to restore from a backup, do the following. First, if the existing database is still actually running, shut it down with the command:

```
artbox stop
service postgresql stop
```

Next, have a look in /var/lib/pgsql/backups/data:

```
ls -lrt /var/lib/pgsql/backups/data
```

What you should see in this directory is one or more tar balls, where the filenames have the form `YYYYMMDDhhmm.tar.gz`

The YYYYMMDDhhmm bit is the backup label. Find the most recent one, and use its backup label to run `/usr/sbin/pitr_restore.sh <backup label>` as the user postgres. You can expect this to take a few minutes.

Once it has finished, you should be able to restart the database server, `service postgresql start` and then restart artbox.

Note: It helps to have plenty of disk space available when restoring, since an extra copy of the database might be recreated.

Directory Layout

Artbox keeps the backups in a peer directory to the database data directory, `/var/lib/pgsql/backups`. Data snapshots are in `/var/lib/pgsql/backups/data` and archived write-ahead-log files are in `/var/lib/pgsql/backups/wal`. At the time artbox does a snapshot, grab the required wal files that might not be archived yet and put them in `/var/lib/pgsql/backups/pending_wal`.

The pitr_purge script throws out any pending_wal files that are already in wal, as well as throwing out anything older than the specified or default number of days.

The restore script moves aside the existing database data directory, if any, and recreates it by untarring the tarball from `/var/lib/pgsql/backups/data`. The archived WAL files are moved back during database startup. The expected result is that we restore the state of the database to the time of the last archived WAL segment, such as the most recent file in `/var/lib/pgsql/backups/wal`.

In the restore script try to use any remaining WAL files from the old installation just before the database quit. If these files are known to be damaged, the old data directory should be removed or moved aside before restoring.

The file `/var/lib/pgsql/pitr.conf` specifies the location of the backup archive. This could be set to somewhere else by editing this file.

Long-term and off-site backups

The backup system described here is short-term and has no built-in allowance for off-site backups. Which means that by itself it's not yet a really useful solution for securing some customer's data. What is needed in addition is to periodically make copies of the contents of `/var/lib/pgsql/backups` and store those copies remotely, or on tape. This could be done on any sort of basis—the more often it's done, the better the ability to recover to a recent state of the database.

Another option would be to make clever use of some remote filesystem and symlinks, and have the `/var/lib/pgsql/backups` directory (or another directory, if you've edited pitr.conf) actually be on a remote system.

Restoring to an empty database

If the server is currently unrestorable create a `/var/lib/pgsql/backups` directory and restore into it the most recent snapshot you have of that directory. You can restore on a similarly configured machine with the same version of postgres which is binary-compatible with the one that was running on the original machine.

Then do the restore process as described above.

Rebuild the text index in PostgreSQL 8.0

A limitation of postgres that is due to be removed in version 8.1 is that GiST indexes (which includes tsearch2 indexes) are not supported by the write ahead log. This means that restoring the database as described above will not by itself restore the state of the text index. An extra step is required. After following the above instructions for restoring start up:

```
psql px pxdb
```

and then run:

```
reindex table pxentity;
\\q
```

Note that in PostgreSQL 8.1 this step is not required.

Setting up a failover primary

You need to choose some shared directory, which can be accessed by both primary and secondary, on a partition which has a reasonable amount of free disk space. There are various ways to achieve a shared directory, such as NFS or shared arrays, but it's probably a good idea to make sure the directory is not on the local disk of the primary, since one of the things we want to be able to recover from is loss of the primary's disks.

You also need to ensure that both primary and secondary can access the directory, and that the user and group ids are consistent enough between the two that the same user/group on both machines will be identified. If the database files normally belong to the user postgres, belonging to group postgres, so as long as you ensure that this user exists on both machines with the same user number, and that the sharing is set up to let this user access the directory.

With this directory chosen, enable failover in the pitr.conf and set PX_DB_FAILOVER_WRITE_PATH to point to the directory. And then make sure that the usual pitr_backup.sh script has been run at least once (as user postgres) since you enabled failover (see the Performing a Backup Snapshot section above).

Setting up a failover secondary

Once you have the primary database running, with failover enabled, you then need to set the secondary going. Edit the pitr.conf file on the secondary to set PX_DB_FAILOVER_READ_PATH to point to the shared directory discussed above.

The secondary needs to already have a `/var/lib/pgsql directory`, since that's where the pitr.conf file is read from. This directory should be owned by postgres:postgres. You don't need a data directory there to start with, although the postgres rpm quite likely made one for you at installation time. It doesn't hurt if there is one there, as the standby script will move it aside.

The version of PostgreSQL on the secondary must match that of the primary in at least the first two numbers, for example 8.1.2 on primary and 8.1.3 on secondary is okay, but 8.1.3 on primary and 8.0.3 on secondary is not. The hardware architectures on the two machines must also match, for example Intel to PowerPC won't work. This is the same criterion for whether you can upgrade a database without needing a dump/restore. The best option, of course, is to have identical versions of postgres on the two machines.

If any database is running on the secondary, stop it now using: `service postgresql stop`.

Look in the failover read directory, in the snapshot subdirectory. You should see a set of files with filenames of the form `YYYYMMDDhhmm.tar.gz`.

The YYYYMMDDhhmm bit is the backup label. Choose the most recent file, and use its backup label in the following command as user postgres:

```
/usr/sbin/pitr_failover_start_standby <backup label>
```

Once this completes, start up the database using: `service postgresql start`.

From this point on, the database will be in recovery mode indefinitely. Every time the primary finishes a WAL file, it will be fed to the secondary, so the secondary will bring itself up to date. When no WAL file is available, the secondary just waits for it. The database on the secondary will refuse all connection requests in this state.

If anything goes wrong with the secondary, or you need to stop it for some reason, you certainly can. Just start again at the beginning of this section. There is no particular point to restarting the standby periodically, but if you need to you can restart it from any more recent snapshot.

Bringing the secondary up

Should you need to bring the secondary database up into production then there are two paths to follow. In the case where you are carefully and deliberately bringing the primary down, under control, then you should run the following on the primary, as user postgres, after stopping its database:

```
/usr/sbin/pitr_finalise_archive.rb
```

This ensures that the most recent WAL file, which may not have been completed, gets copied to the failover directory. The result of this should be that the secondary will notice it has an incomplete WAL file, and complete the recovery. If it hasn't come up after a minute or two, you could try running the command mentioned below for the uncontrolled failover case, since it seems conceivable that if you were incredibly unlucky with your timing, the last WAL file copied across by the above might actually be complete.

If necessarily, proceed to bring the secondary up as best it can. This means the database will not be completely up to date, as the last WAL file might not be available—how far behind it is depends on how active it has been recently.

You bring it up by running the following on the secondary, as user postgres:

```
/usr/sbin/do_pitr_failover.sh
```

What this does is write a file named FAILOVER_NOW into the failover read directory. The restore script will recognize this as the signal to stop the recovery, and bring the database up fully. The database should come up quite quickly.

Once you've followed either of the above two approaches, verify that the database is up and running by attempting to connect to it using:

```
psql px pxdb
```

As soon as you can do this, then the database is ready for use, and you can point the artbox storeserver and the order management system at it, such as by reconfiguring them.

Once your database is running again, you need to start planning for the future. Your former secondary is now your primary. Assuming that either the old primary or its replacement is going to be brought back online at some point, you will want that box to become the secondary. So you'll need to start again at the "Setting up a failover primary" section and go from there. The failover directory will need to be cleaned up a bit before you re-use it properly—it's probably a good idea to use a completely different directory for failover from now on. At the least, you need to remove the FAILOVER_NOW file.

From this point on, either the old secondary and primary will reverse roles forevermore, or you will revert the old secondary to being a secondary again— which means you have to do this failover process one more time, to get the old primary or its replacement up to date with the new primary, and then failover to become the new primary.

Dealing With Symlinks

A common scenario is that a postgres database may be installed in the usual `/var/lib/pgsql`, but the data subdirectory might be a symlink to some other drive or partition. You can handle that case by careful configuration. In the pitr.conf file (which is always in /var/lib/pgsql), you set the PX_DB_DATA_PATH to point to the actual directory the database lives in, such as the direct, non-sym-linked, path to the data. This still needs to be in the directory above the actual data directory. The PX_DB_DATA_DIR variable still needs to refer to the name of the directory in PX_DB_DATA_PATH that contains the database. It is important, by the way, for this directory name to be the same on both primary and secondary.

For example, if you have a big disk mounted at /var/big/disk, the actual database data directory is at /var/big/disk/data, and you have /var/lib/pgsql/data symlinked to /var/big/disk/data, then as long as you set PX_DB_DATA_PATH to /var/big/disk, everything should work.

Note: If the actual data directory is on some shared array, such as with a SAN, make sure that the two database servers do *not* use the same data directory.

Artbox Failover Solution

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

Highly Available Shared Disk Solution

This solution provides a highly available artbox, at relatively low cost. Two Dell PowerEdge 2850[1] are connected to a shared SCSI disk array (Dell PowerVault 220[1]). This will provide a Highly Available solution. In terms of this solution, this specifically means that if one of the PowerEdge 2850's becomes disconnected from shared storage (be it a hardware or software issue), the other box will automatically take over the load.

For the shared storage, direct attached SCSI was chosen as it offered the best price and performance for a two box solution. Networked Attached Storage (NAS) is not an option for this solution as it would not be able to offer the performance that we require for the database. Fiber Channel solutions, whilst they provide more flexibility, are prohibitively expensive and would not fit within the some organization's price constraints.

Hardware

- 2 x Dell PowerEdge 2850[1] but with the following changes:
  - 2 x 73 GB 15,000 RPM disks for the system (RAID 1)
  - PERC4/DC Raid Controller card for connection to the Power Edge
- 1 x Dell PowerVault 220S, with the following:
  - Redundant Power Supply
  - 9 x 146 GB 10,000 RPM SCSI Drives configured as RAID 5 (to give 1 GB available space, and a 'hot spare' disk)

or

- 1 x HP ProLiant DL380 G4 Packaged Cluster with MSA500 G2 (8U configuration), with the following:
  - 2 x 73 GB 15,000 RPM disks for the system (RAID 1) for each local server.
  - Redundant Power Supply
  - 14 x 146 GB 10,000 RPM SCSI Drives configured as RAID 5 (to give 1 GB available space, and a 'hot spare' disk), or as many as the customer requires.

Software

- 2 x RedHat ES 3.1[1]
- 1 x RedHat Cluster Manager[1]

Configuration Notes

- The PowerEdge 73G RAID 1 is used for the OS, artbox software and temp storage.
- The PowerVault is is configured (at least two partitions: 1 for db, 1 for media) & mounted. The postgresql database is copied to it, and a symlink made from /var/lib/pgsql
- Each box has it's own dongle, and there is a license server running on each box. The license will be the same, apart for the dongle ID.
- RedHat Cluster Manager[1] is used to manage the failover processes (mounting of RAID, starting and stopping of services, taking up of 'artbox' IP address)
- Each machine is configured with a fixed IP address. There is also an virtual address for 'Artbox' — this is taken up by whichever machine is the current 'master'.
- Heartbeat connection will be redundant—network and serial connection should be used
- When both boxes are operational, extra performance might be gained by used the secondary box as the LDS server (this requires testing). At a later stage, when we are able to support multiple LDS's we would be able to fully utilize CPU cycles on both boxes to allow more processes to run simultaneously

Limitations

- The maximum cable length of the SCSI cables is 4 meters, so the servers need to be in close proximity to each other
- As the media and database is shared, any corruption to those items will exist on both boxes. Other backup techniques should be used in conjunction with this solution.
- If the PowerVault shuts down unexpectedly, artbox becomes completely unavailable. Backups must be used to get up and running again.

Installation

TA24665_Artbox_Failover_Solution.pdf

1. Install RedHat ES[1] on each of the servers. Update with the latest patches if possible. Partition the RAID 1 internal system disks as you see fit. Give each one a fixed IP address and DNS entry.
2. Install artbox on each machine, as you normally would on a single box solution. Use the latest version available.
3. Disable any artbox components from being able to start up on the default runlevel. Eg:

   ```
   /sbin/chkconfig artbox off
   ```

   This needs to be done for the following init scripts:

   ```
   artbox  artbox-clipcopy  artbox-copyd  artbox-lds  artbox-newsroomd auto_pg_autovacuum postgresql
   ```

   Stop any of these services from currently running.

4. Attach a dongle to both boxes. Pxlicensed is required to be running on each box, and each will require a separate license.
5. Configure one of the RAID cards to have a different ID. Connect up the PowerVault to the two PowerEdges. From the primary box, make 4 partitions:
   - 2 x 10 MB; no filesystem required (they are RAW, for quorum)
   - 1 x 30 GB; format as ext3 (for DB)
   - 1 partition with the rest of the hard drive capacity; format as ext3 (for data)
6. Try to mount the db and data partition somewhere onto the first box. Write some data to them to check, then unmount. Do the same on the second box—you should see the previously written data. They cannot be mounted on each box at the same time otherwise data corruption occurs.
7. Make a directory on each box for both the DB partition and the Data partition. An example:

   ```
   /mnt/data   (for data partition)
   /mnt/db     (for database partition)
   ```

8. On the primary box, mount the database partition on the directory created for it. Move the database to it:

   ```
   mv /var/lib/pgsql /mnt/db/
   ```

   make a symlink from the new location to the old:

   ```
   ln -s /mnt/db/pgsql /var/lib/pgsql
   ```

   Unmount the DB partition.

   On the secondary box, remove the /var/lib/pgsql, and make the same symlink. Mounting the DB partition is not required.

9. Subscribe to, download and install the RedHat Cluster Manager[1] rpms. These should be the following (the version numbers might be different):
   - clumanager-1.2.22-2.i386.rpm
   - piranha-0.7.10-2.i386.rpm
   - rh-cs-en-3-2.noarch.rpm
   - ipvsadm-1.21-9.ipvs108.i386.rpm
   - redhat-config-cluster-1.0.3-1.noarch.rpm
10. Now would be a good time to read the cluster manager documentation was installed. it can be found here:

    ```
    /usr/share/doc/rh-cs-en-3
    ```

11. As per the documentation, create the raw devices file and start the service. This needs to be done on each box. As an example, here is the one on the prototype sydney setup. The partitions will vary:

    ```
    [root@artbox02 root]# cat /etc/sysconfig/rawdevices
    # raw device bindings
    # format:  <rawdev> <major> <minor>
    #          <rawdev> <blockdev>
    # example: /dev/raw/raw1 /dev/sda1
    #          /dev/raw/raw2 8 5
    /dev/raw/raw1   /dev/sdb1
    /dev/raw/raw2   /dev/sdb2
    ```

12. Now configure the cluster. The following files can be used for a base (username/pass is default xenobox pair):

    ```
    artbox02.proximity.com.au:/etc/clustermanager.xml
    artbox02.proximity.com.au:/etc/samba/smb.conf.media
    ```

    Get each of those files. In clustermanager.xml, you will need to modify the following two lines:

    ```
    <cluquorumd loglevel="6" pinginterval="" tiebreaker_ip="192.168.128.2"/>
    ```

    replace that with the ipaddress of hades for testing.

```
<service_ipaddress broadcast="192.168.128.255" id="0" ipaddress="192.168.128.217"
netmask="255.255.255.0"/>
```

replace with a spare ipaddress. This is the virtual address that will be the one used to contact Artbox and the samba service

In the smb.conf.media file, modify as appropriate for the setup (the 'path' might be the only variable that require changing for testing)

13. Edit /usr/artbox/conf/artbox.conf on each machine. Modify the following lines:

```
LDS_ADDRESS={whatever is the HA virtual address}
PX_LICENCE_SERVER={the local machine}
```

14. Start the cluster manager on each box:

```
/etc/init.d/clumanager start
```

Monitoring

To monitor the system, and the states of the various managed processes, the following X tool can be used:

```
redhat-config-cluster
```

This can either be run on the primary or the secondary machine. As it is an X program, it can be run remotely—for example, from a Mac OS X desktop

Testing

Simulation of node disconnection if the HA cluster can be done by shutting down or pulling network out of a node. In the case of the later, the HA software realizes that it cannot contact the tiebreaker IP, and does a hard forced reboot. In both cases, the secondary node should compensate within a few seconds. Either method can, and should, be tried.

The following should be tested when a node disconnection is simulated:

1. Searching assets (click on 'search' every few seconds). There should be about 10-15 seconds when a 'connection refused' is reported by the Java UI, but then should work as before.
2. Uploading to a device.
3. Copying to a the Samba share (into an watch folder).
4. Copying from the Samba share.
5. Copying from one device to another in the middle of a scan when a number of jobs are 'queued.'

Artbox will not put jobs that are in the RUN or WAIT state into FAIL state automatically. The benefit is that jobs that were in the RUN or WAIT state prior to the failover cannot be retried.

Upgrading

This process is a little more complex that a usual upgrade, as both nodes need to be upgraded.

1. Use the 'redhat-config-cluster' program to stop all of the 'Artbox' processes. Everything except Postgresql and auto_pg_autovacuum should be stopped
2. On the primary node, upgrade the artbox rpms as normal. Note that postgres should be running on this box
3. Using the 'redhat-config-cluster' program, start all of the previously stopped processes.
4. On the secondary box, there should be no artbox or postgres processes running. Upgrade the rpms as normal. The artbox rpm will print a number of errors to the effect that it is unable to connect the database - this can safely ignored. The software should now be up to date
5. Test the HA by intentionally failing the primary node

Apple Studio Display 15-inch LCD: Restart To Clear Video Anomalies

I have an Apple Studio Display 15-inch LCD and when I started up I noticed that the screen is all white to where you can't see anything on the display. Is this a problem with the display?
This article has been archived and is no longer updated by Apple.
When troubleshooting an Apple Studio Display for a failure specific to the display and not the computer.

First, with the system powered down, disconnect the ADB cable on the CPU, disconnect the AC power to the display, reconnect the AC power to the display, and reconnect the ADB cable on the CPU.

Next, verify the keyboard's ADB cable is connected to the ADB port on the Apple Studio Display's stand.

Finally, startup the computer to confirm if the problem remains.

A few examples of symptoms which may be resolved by performing the steps above are as follows:

- No video
- All white raster
- Random/predominant color throughout the display
- Function keys on the bottom of the display don't respond

If the problems remain, after performing the steps above, contact an Apple Authorized Service Provider in your area or contact Apple at 800-919-2775 for service.

Artbox SMB Config

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

After you finish installing Artbox, you must now make sure that samba is setup correctly. Here is the proper smb.conf file that needs to be present in /etc/samba/smb.conf. Remember to edit the workgroup setting as this is Station Specific.

```
# This is the main Samba configuration file. You should read the
# smb.conf(5) manual page in order to understand the options listed
# here. Samba has a huge number of configurable options (perhaps too
# many!) most of which are not shown in this example
#
# Any line which starts with a ; (semi-colon) or a # (hash)
# is a comment and is ignored. In this example we will use a #
# for commentary and a ; for parts of the config file that you
# may wish to enable
#
# NOTE: Whenever you modify this file you should run the command "testparm"
# to check that you have not made any basic syntactic errors.
#
#======================= Global Settings =====================================
[global]

# workgroup = NT-Domain-Name or Workgroup-Name
   workgroup = PROXIMITY

# server string is the equivalent of the NT Description field
   server string = Artbox

# if you want to automatically load your printer list rather
# than setting them up individually then you'll need this
   printcap name = /etc/printcap
   load printers = yes

# It should not be necessary to spell out the print system type unless
# yours is non-standard. Currently supported print systems include:
# bsd, sysv, plp, lprng, aix, hpux, qnx, cups
   printing = cups

# this tells Samba to use a separate log file for each machine
# that connects
   log file = /var/log/samba/%m.log

# Put a capping on the size of the log files (in Kb).
   max log size = 0

# Security mode. Most people will want user level security. See
# security_level.txt for details.
   security = share

# You may wish to use password encryption. Please read
# ENCRYPTION.txt, Win95.txt and WinNT.txt in the Samba documentation.
# Do not enable this option unless you have read those documents
   encrypt passwords = yes
   smb passwd file = /etc/samba/smbpasswd

# The following are needed to allow password changing from Windows to
# update the Linux system password also.
# NOTE: Use these with 'encrypt passwords' and 'smb passwd file' above.
# NOTE2: You do NOT need these to allow workstations to change only
#        the encrypted SMB passwords. They allow the Unix password
#        to be kept in sync with the SMB password.
   unix password sync = Yes
   passwd program = /usr/bin/passwd %u
   passwd chat = *New*password* %n\\n *Retype*new*password* %n\\n
     *passwd:*all*authentication*tokens*updated*successfully*

# You can use PAM's password change control flag for Samba. If
# enabled, then PAM will be used for password changes when requested
# by an SMB client instead of the program listed in passwd program.
# It should be possible to enable this without changing your passwd
# chat parameter for most setups.

   pam password change = yes
```

```
# This parameter will control whether or not Samba should obey PAM's
# account and session management directives. The default behavior is
# to use PAM for clear text authentication only and to ignore any
# account or session management. Note that Samba always ignores PAM
# for authentication in the case of encrypt passwords = yes

  obey pam restrictions = yes

# Most people will find that this option gives better performance.
# See speed.txt and the manual pages for details
   socket options = TCP_NODELAY SO_RCVBUF=8192 SO_SNDBUF=8192

# DNS Proxy - tells Samba whether or not to try to resolve NetBIOS names
# via DNS nslookups. The built-in default for versions 1.9.17 is yes,
# this has been changed in version 1.9.18 to no.
   dns proxy = no

#============================ Share Definitions ==============================
[homes]
   comment = Home Directories
   browseable = no
   writable = yes
   valid users = %S
   create mode = 0664
   directory mode = 0775

[media]
   comment = Media
   path = /home/media
   guest only = yes
   public = yes
   writable = yes
   force user = artbox
   force group = artbox
   create mask = 0765
```

Now that you have the correct config file and it is in /etc/samba/smb.conf, you must now make sure that Samba is setup to run on startup. Run `'chkconfig smb on'`. This will make Samba run each time at start-up.

Artbox Newsroom Plugin Boolean Searching

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

Boolean Searching

The Boolean Searching feature provides the Newsroom plugin user with a more powerful search interface through the single-field google-style search form. All metadata fields and all servers (for which the user has view permission) are searched with a single text criteria field. The feature allows the use of various special search tokens to intelligently narrow down a search. The special tokens are explained below.

Implicit ANDs

An 'AND' is implicitly added between each word in a search query. This means that each word in a search query is taken to be a separate query string, but all words are required in the metadata of each media object returned in the search results.

For example, a search query of *Foo Bar* would return all media objects who's metadata contains the string 'Foo' and also contains the string 'Bar'.

Exact Matching

In order to search for an exact string, including spaces and punctuation characters, place quotes around the string. Characters within a quoted string will be matched exactly, and no special meaning will be applied to any of the quoted characters.

For example, the search query *"Mug Shot"* will return media objects with the following metadata:

- Mug Shot
- Mug Shots of perps

but **not:**

- Mugs taking Shots
- Ugly Mugs get shot
- Mugs
- Shots of Paris

Explicit Exclusions

By prepending a '-' (minus character) in front of any search element, anything matching that element will be explicitly excluded from the search results.

For example, *rain -train* will return all media objects who's metadata contains the string 'rain', except for those that contain the string 'train'.

Word Stops

The substring search behavior may be inhibited by placing word stop anchors at the beginning and/or end of a word.

For example, <*rain*> will return media objects with the discrete word 'rain' in their metadata, but **not** 'train' or 'rains' or 'brain'.

Another example, <*cat* will return media objects with the word 'caterpillar' in their metadata, but **not** 'bobcat'.

Escaping Special Characters

Sometimes you may want to search for a character that usually has special meaning (ie. < > - " \\). In order to remove the special meaning of the character, precede the character with a '\\'. To search for a '\\', enter '\\\\'.

For example, you may want to search for 'help-desk'. In order to remove the special meaning of the character '-' (explicit exclusion), use the search query *help\\-desk*.

Artbox Consolidated Install

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

Operating System Install

1. Set up and test server platform. Install all hardware, create hardware based RAID's, disk mirroring, etc. Note server RAM amount and gather IP addresses, DNS and Gateway settings.
2. Obtain and create CD's of the most current version of Red Hat Linux (CentOS 4.6 is recommended, Artbox will not run on CentOS 5).
3. Boot from 1st Linux CD. Pick graphical install. Skip media check, apply a language choice, and then choose "Server" profile.
4. Choose manual partition with Disk Druid. Delete any and all existing drive partitions. If prompted, choose to erase all data.
5. Create 3 partitions on primary drive in the following order:
    - mount point:/boot - filesys type:ext3 - size:100MB - fixed size - force to be a primary partition
    - mount point:not applicable - filesystype:swap - size:(installed RAM x 2) - fixed size - force to be a primary partition
    - mount point:/ - filesys type:ext3 - fill to max allowable size - force to be a primary partition

    Note: if your system has a split RAID, set the data partition to `/home`

    - Accept "Grub" as default boot loader.
6. Configure NIC for fixed static IP address. Choose Activate on boot. Do not use DHCP. Include valid DNS and Gateway addresses. For hostname use artbox.yourdomain.
7. Set a secure root password that you will remember.
8. Disable SELinux, no firewall. Click "proceed" all the way past warning about no firewall.
9. For Package Group Selection, include:
    - XWindow
    - Gnome
    - Editors
    - Text Based Internet
    - Graphical based Internet
    - Server Configuration Tools
    - Mail Server
    - Windows File Server
    - FTP Server
    - Development Tools, click "Details" make sure "Ruby" is checked.
    - Administration Tools
    - System Tools

    Note: Do not install Postgresql or any type of SQL.

10. Complete the CD install and agree to Linux License.
    1. Set correct time and date. Enable net time protocol. Accept default servers and see if system connects and synchs. If not, contact your system admin to find the settings for your location.
    2. Make sure the hardware clock uses UTC
    3. Change to 1024x768 screen resolution. Do not create any other users. Skip sound check and additional package install.
    4. Continue and log in as root.

Artbox Installation

1. Create /root/artbox from a terminal session or at the command prompt.

    ```
    mkdir /root/artbox
    ```

2. Download the artbox install RPMs into /root/artbox

    The directory must contain:

    - artbox-3.2.11-1.i686.rpm
    - artbox-lds-3.2.11-1.i686.rpm
    - artbox-clipcopy-3.2.11-1.i686.rpm
    - artbox-clipcopy-common-1.0.7-1.i686.rpm
    - artbox-jre-1.4.2_03-1.i686.rpm
    - pxlicenced-1.0.6-1.i686.rpm
    - pxpginstall-1.0.8-1.i386.rpm

- postgresql-8.1.3-1PGDG.i686.rpm
- postgresql-contrib-8.1.3-1PGDG.i686.rpm
- postgresql-libs-8.1.3-1PGDG.i686.rpm
- postgresql-server-8.1.3-1PGDG.i686.rpm
- QuickTimeFullInstaller.exe

Note: The version numbers and names of the RPM may vary depending on which version of artbox you are running.

3. Obtain and secure a valid Artbox license file for the install.
4. Change to install directory.

```
cd /root/artbox
```

5. Uninstall any latent versions of Postgresql.

```
rpm -e --nodeps `rpm -qa | grep postgresql`
```

6. Install the Postgresql package installer.

```
rpm -Uvh pxpginstall-1.0.8-1.i386.rpm
```

7. Use this command to install all Postgresql RPM's. Do not install Postgresql RPM's manually.

```
pxpginstall --pg_81
```

8. Install License service.

```
rpm -Uvh pxlicensed-1.0.5-1.i686.rpm
```

9. Start the license service

```
service pxlicensed start
```

10. Install Artbox clipcopy-common and java modules.

```
rpm -Uvh artbox-clipcopy-common-1.0.7-1.i686.rpm
artbox-jre-1.4.2_03-1.i686.rpm
```

11. Start the clipcopy service

```
service artbox-clipcopy start
```

12. Install Apple Quicktime Licensing. This process emulates a Windows software installer.
    1. Copy the Quicktime installer program into the correct directory.

    ```
    cp /root/artbox/QuickTimeFullInstaller.exe  /usr/artbox/share/wine/Install/
    ```

    2. Start the Quicktime installer program from a shell prompt

    ```
    /usr/artbox/sbin/install_quicktime
    ```

    3. Direct a web browser to *http://ip-of-artbox:5802*
    4. Run through the installation, use the secure password you set earlier.
13. Install main Artbox modules.

```
rpm -Uvh artbox-3.2.11-1.i686.rpm artbox-lds-3.2.11-1.i686.rpm artbox-clipcopy-3.2.11-1.i686.rpm
```

14. Start the Artbox service.

```
artbox start
```

15. Start this service (this service is automatically launched in 3.2.12).

```
service pg_autovacuum start
```

Artbox Pre-Configuration

1. Create the directories needed for basic Artbox operation. "'Maintain name and capitalization patterns.'"

```
mkdir /home/artbox/Contentbase /home/artbox/Media /home/artbox/Watchers
```

2. Change the following settings in /etc/samba/smb.conf:

```
workgroup=(YOUR WINDOWS DOMAIN)
server string = Artbox
security = share
```

3. Add the following type of entry in /etc/samba/smb.conf. Modify and repeat for each share.

```
Artbox Watchers
```

```
comment = Artbox Watchers
path = /home/artbox/Watchers
guest only = yes
public = yes
writable = yes
force user = artbox
force group = artbox
create mask = 0765
```

4. Start the samba service manually.

```
service smb start
```

5. Make sure Samba starts automatically on server startup.

```
chkconfig smb on
```

6. Assign ownership to each Samba share directory

```
chown -R artbox /home/artbox/path-to-share
chgrp -R artbox /home/artbox/path-share
```

7. Mount and test samba shares from a computer client. Test file read and write to each share.

Artbox Basic Configuration

1. Edit /usr/artbox/conf/httpd.conf.

```
ServerName = ip-of-artbox
```

2. Edit /usr/artbox/conf/artbox.conf.

```
LDS ADDR = ip-of-artbox
```

3. Direct a web browser to *http://ip-of-artbox*. Artbox web interface should start up. Login with user "admin" and password "admin".
4. Go to License link. Copy and paste in the text of a valid Artbox license into the windows towards the bottom of the screen. Hit apply button. and then logout.
5. Restart the Artbox service to take the configuration and license changes.

```
artbox restart
```

6. Direct a Java-capable browser to *http://ip-address-of-artbox/artbox*.
7. Run the downloaded .JNLP program—This is Artbox's Java Interface. When login screen appears, type in artbox IP.
8. Login with username "admin" and password "admin"
9. Go to Administration > Devices (not the Devices tab on the main screen)
10. Create the very first device—a contentbase named "Artbox Contentbase", with path to /home/artbox/Contentbase.
11. Create a second device—a file system named "Artbox Watchers" with path to /home/artbox/Watchers
12. Run commands to initialize transcode templates.

```
ab_config --mode copy_templates
ab_config --mode analyse_params --params /usr/artbox/conf/artbox_params
```

Order Management System Configuration

1. Execute the following commands to initialize OMS responses.

```
ab_config --mode attach_sub_response
ab_config --mode srcattach_sub_response
```

2. In artbox java app, create a group labeled "artist".
3. Create the following directories on the artbox server.

```
mkdir /home/artbox/CompletedAssets /home/artbox/SourceMaterial
```

    1. Create a contentbase device in the java app called Completed Assets. Set path as /home/artbox/CompletedAssets.
    2. Create a contentbase device in the java app called Source Material. Set path as /home/artbox/SourceMaterial.
4. Log in to artbox web interface as admin
5. Create a City, and then a Station
6. Create user account for artist and add to artist group. Enable all permissions for artist.
7. In Global Settings choose Source Material and Completed Assets Servers
8. In Stations create a publish destination

Mac OS X 10.4: Reading .plist preference files

This article has been archived and is no longer updated by Apple.

Mac OS X applications typically store preference settings in plist files, such as "com.apple.Mail.plist". In Mac OS X 10.3.9 and earlier, plist files were typically in XML format. In Mac OS X 10.4 and later, plist files are often in binary format for faster application performance.

Reading .plist files

Important: You should not usually modify preference files directly. Instead, you should use the associated application's Preferences menu(s) to customize your settings.

In certain situations you may need to read preference files directly using one of the following methods.

- The Property List Editor application, included with Apple's Developer Tools, can open plist files in both XML and binary formats.
- You can read a binary plist file in a text editor by converting it to XML format. Use the following command in Terminal:
  ```
  plutil -convert xml1 /path/to/file.plist
  ```
  Be sure to replace "/path/to/file.plist" with the full path to the file you want to convert.

Apple Studio Display 15-inch LCD: Vertical Gray Bar With Monitors & Sound

I have an Apple Studio Display 15-inch LCD and when I adjust the horizontal position to the maximum position, either to the right or to the left, through the Monitors and Sound control panel, I notice a 1/4 inch vertical gray bar going down the edge of the screen. Is this normal?
This article has been archived and is no longer updated by Apple.
Yes, when you move the position of the display (raster) all the way to the left or right of the screen, you are displaying an area of the display which is outside of the usable area. This area can be various colors other than gray.

To correct this problem, adjust the screen position, through the Monitors and Sounds control panel, so that the raster is centered in the usable area of the display.

Artbox: Setting Up a Samba Share

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

This setup configuration allows for open sharing, where everyone has read, write, and delete permission.

```
[global]
  workgroup = proximity
  server string = Samba Server
  guest account = guest
  log file = /var/log/samba/%m.log
  max log size = 0
```

By default this is set to 'user' in RH8. It has to be changed to 'share' to work as a fully open share.

```
  security = share
  encrypt passwords = yes
  smb passwd file = /etc/samba/smbpasswd
  unix password sync = Yes
  passwd program = /usr/bin/passwd %u
  passwd chat = *New*password* %n\\n *Retype*new*password* %n
    \\n *passwd:*all*authentication*tokens*updated*successfully*
  pam password change = yes
  obey pam restrictions = yes
  socket options = TCP_NODELAY SO_RCVBUF=8192 SO_SNDBUF=8192

  dns proxy = no
```

Normally the [homes] section is enabled but it's recommended to disable it. A directory that is being shared as part of [homes] such as /home/publisher is treated differently then other directories, even if it is shared under another name.

```
[homes]
comment = Home Directories
browseable = no
writable = yes
valid users = %S
create mode = 0664
directory mode = 0775
```

If you want users samba doesn't recognize to be mapped to a guest user map to guest = `bad user`.

This is an example of how to share the CD-ROM of the machine running Samba to everyone. If you want to make a writable share, just change the path to something that can actually be written to and then change writable to yes.

```
[cdrom]
  comment = CD-ROM Drive
  path = /mnt/cdrom
  browseable = yes
  writable = no
  guest ok = yes
  public = yes
```

Make sure that the path that you are sharing exists. So for example if your path line read as "path = /foobar" you would go to the command line and do "mkdir /foobar". And after use "chmod 777 /foobar" on the directory you want shared.

Artbox Workflow Configuration

This article has been archived and is no longer updated by Apple.

Disclaimer: Proximity Corporation provided the information in this article and it was deemed accurate as of 30 May 2007. Apple Inc. is not responsible for the article's content. This article is provided as is and may or may not be updated in the future.

The Artbox Workflow application can be configured in any number of ways so the purpose of this document is to outline a set of general guidelines that should hopefully allow us to have a consistent configuration across most customers.

General Setup

Devices

For any Artbox Workflow installation you will usually have configure at least 3 devices, the completed assets server, source material server and a publish destination device.

- Completed Assets Server
  - Media attached to an order for completion from the upload applet is copied to the completed assets server. An associated asset is always created and it's type is determined when the initial order is made. It is important to note that not all completed orders assets are stored on the completed assets server, if the order is completed using the Completed Material subscription the media could be sitting on any artbox device.
  - As a general rule the completed assets device has been configured as a dedicated "contentbase" (it should be a different device from the artbox contentbase /dev/1). A contentbase is advised as it stops filename clashes and is quicker to manage than a large flat filesystem.
- Source Material Server
  - The source material server is used to attach supplementary content to an order.
  - It is advised to configure this as a local filesystem device. The usefulness of the content is generally limited to the lifetime of the associated order.
  - This functionality seems to be rarely used.
- Publish Devices
  - Publish devices are the devices where media gets copied to when an order is complete.
  - Content also gets copied to a publish device after a drag n' drop operation.

User Groups

In general there are at least two types of Artbox user groups configured, artist and news.

- Users in the artist group in most cases use the artbox UI to manage content and the web based workflow tool to manage orders. Users in the artist group generally will access to all but the admin functionality in artbox.
- Users in the the news groups generally only use the newsroom plugin to access artbox. In most cases these users should only be able to browse assets that are play-out ready (ie. they shouldn't see the whole asset base). Because of this we are generally using the asset filter "stored on" field to restricts those in the news group to see assets stored on the "completed assets" device.
- Obviously user group requirements could vary from station to station.

Assets

All completed orders are associated with at least one asset. This is particularly important for the order process through the plugin as newsroom people will find complex asset types confusing and it makes the system more prone to operator error.

Completing Orders from a Quantel

Use the following suggested instructions to attach graphics to orders with one of the Quantel MO fields:

- Edit the "Asset Filter" metadata group and add the "Description (Custom Metadata)" field to the fields
- Create a metadata field called "Quantel Attach Tag Id" and make it a string type.
- Do a metadata map (1 way) from "Description (Quantel Netcomm device)" to "Quantel Attach Tag Id". (priority 3)
- Do a metadata map (1 way) from "Quantel Attach Tag Id" to "Attach Tag Id". (priority 3)
- Create an new media asset type called "Quantel Graphic". (with no mdgroups selected)
- Create a new metadata group called "Quantel Order" with the flowing properties
  - Add the "Quantel Attach Tag Id" field to Fields selected
  - Add "View Details, Edit Details and Create" to Actions
  - Add "Quantel Graphic" to Types[[/Traits]].
  - Set the priority to 5
- Edit the "Quantel Graphic" Asset type and add the "Graphic" and "Quantel Order" metadata groups

- Change all Quantel scans so that they create "Quantel Graphic" asset types. (The quantels must be scanned for this to work)
- Add a new copy response called "Quantel Order" and add the following details.
    - Destination "Completed Assets Server"
    - Template depends on destination device (Targa for Deko Stills)
    - Asset type "Graphic"
    - Default values otherwise
- Add a new asset subscription called "Quantel Order" with the following details.
    - Event Type Filter "Create"
    - Response List "Quantel Order"
    - Asset Type "Quantel Graphic" (on asset filter tab)
    - Description "begins with" "%t" (on asset filter tab)
- Now if you put an order tag in the description field of a MO on a quantel that MO will be attached to the order after the next scan on that device.

Managed Client: How to prevent profanity from appearing in Dictionary

This article has been archived and is no longer updated by Apple.

You can use Workgroup Manager to prevent profane words from appearing in Dictionary:

1. In Workgroup Manager, select a user, group, or computer list record.
2. Click Preferences, then the Details tab.
3. Click "Add" and add this preference file:
   ~/Library/Preferences/com.apple.Dictionary.plist

4. Double-click "com.apple.Dictionary" in the list to edit it.
5. Click the Often domain, then click the Clear button to remove all the entries.
6. Expand the Always domain by clicking the disclosure triangle.
7. Click "New Key" and enter this information:
   name: parentalControl
   type: boolean
   value: true

8. Click Apply Now.
9. Click Done to exit the preference editor.

The record selected in step 1 will now be prevented from seeing expletive words in Dictionary.

Apple Studio Display 15-inch LCD: Calibration Lists No Profile

I have an Apple Studio Display 15-inch LCD and when I tried to calibrate the display, via the Monitors and Sounds control panel, there was no profile to select for the Apple Studio Display in the monitor calibration assistant's profile's list.

Is this a known problem and if so what profile should I select for this display?
This article has been archived and is no longer updated by Apple.
The monitor calibration assistant's profile list is a static list where the Apple Studio Display 15-inch LCD profile did not make it into the 2.5 release of ColorSync. This is not an issue with the profile selection in the Color panel, just with the calibration assistant's profile list.

Until the next release of ColorSync is available use the Generic Color LCD profile for this display.

Fixing Incorrect Song or Album Listings in iTunes

This article has been archived and is no longer updated by Apple.

When you purchase a single track or extended play (EP), especially as a pre-release single before the release of a new album, then later complete the album using "Complete My Album", the track's information may be different from that of the rest of the tracks on the album. This will cause the album track listing to be out of order in your playlist.

The highlighted track below is an example of how these tracks may appear in your library. Notice that the track numbering as well as the album information is incorrect.

Correcting this is simple! By editing the information of the song, you will correct the sort order and the song will appear correctly in album view.

Editing Track Information in iTunes

To view and edit a song or video's info in iTunes:

- Click once on the track title to select it
- From the **File menu**, choose **Get Info**
- Click the Info tab

You will see a screen like the one below:

Before you edit the affected track's information, you may want to look at the Info tab of one of the other songs on the album. This may reveal additional information which is not displayed in your default iTunes track listing.

You can also use the arrow links in iTunes to find the updated track listing in iTunes for the affected song. Once you've found the track on the iTunes Store, select it and choose "Get Info" from the File Menu to view the Track Number and Album information for the file.

- **Note:** Arrow links to the iTunes Store can be enabled/disabled from the General tab in iTunes Preferences.

In this example there are three pieces of information that need to be updated to correctly display this track in the album's listing:

- Album title
- Track Number
- Genre
    - **Note:** The Genre information is not displayed in the iTunes track listing by default. The correct Genre listing can be found by viewing the Info tab on another song on this album.

Type in the correct information for this track and then click OK.

After you have changed the information and clicked OK to save your changes, the track will appear in your album listing in the correct order.

Boot Camp 2.0: iSight camera gamma settings available for Windows XP-based applications

This article has been archived and is no longer updated by Apple.

With Boot Camp 2.0 (included with Mac OS X 10.5 Leopard) and Microsoft Windows XP, one of two gamma settings can be used for a built-in iSight camera. For example, you may need to enter the gamma value in a webcam application such as Skype.

The gamma value can be set to either 1.0 or 2.20.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Important: Apple does not provide technical phone support for installing, using, or recovering Microsoft Windows. Support is available for using Boot Camp Setup Assistant, as well as installing or restoring Boot Camp software while booted into Windows. Support articles and discussions may also be available on Apple's support website.

Apple Remote Desktop: Accessing data in the ARD database using industry-standard database tools

This article has been archived and is no longer updated by Apple.

Apple Remote Desktop (ARD) versions 2.x and 3.x store system information gathered from clients in a PostgresSQL database. This data can be accessed by
industry-standard ODBC compliant database tools or via command-line tools. The data can used for archival purposes, customer reporting, and client maintenance.

To learn more about accessing the data in the Apple Remote Desktop database, see this article.

Note: The complimentary support included with new Apple products does not include assistance for these advanced procedures. However, fee-based support is available through AppleCare in both a single incident and annual contracts. See Mac OS X Server Software Support for more information. Single-incident support
contacts must be purchased directly from AppleCare.

Apple Studio Display 15-inch LCD: Green Tint Throughout Display

I have an Apple Studio Display 15-inch LCD running on a Power Macintosh with a Radius ThunderColor 30/1600 PCI video card. I've noticed that my display has a predominant green color throughout. Is this a problem with my display or my computer?

This article has been archived and is no longer updated by Apple.

The predominant green color that is displayed is due to the fact that the video source syncs to green video which incorporates VSync and HSync. The best way to get around this problem would be to use a different video card or by obtaining a third party display adapter such as Griffin Technologies Mac Sync Adapter.

iSync 2.4: Some Sprint-based Motorola phones may not be recognized

This article has been archived and is no longer updated by Apple.

Issue or symptom

iSync 2.4, included with the Mac OS X 10.4.9 Update, supports many phones. Due to firmware differences, some Sprint-based phones manufactured by Motorola may not be recognized by iSync 2.4.

Solution

The same versions of these Motorola phones offered for sale by other service providers are not affected by this issue.

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About Xserve Lights-Out Management Firmware Update 1.1

This article has been archived and is no longer updated by Apple.

This update provides enhanced reliability to the monitoring and management features of Intel-based Xserves by changing the Lights-Out Management environment. This update is strongly recommended for all Intel-based Xserve systems.

The Xserve Lights-Out Management Firmware Update 1.1 works only on Intel-based Xserve systems. The update implements version 1.2.8 of the firmware.

Typically, the Lights-Out Management firmware can be updated without requiring a restart and without impacting running Mac OS X Server services. Existing lights-out management settings will be preserved and current Server Monitor connections will be interrupted. If an issue occurs during the firmware flashing, you may be prompted to perform a full firmware flash, which requires a server restart and re-entering the lights-out management settings in Server Monitor.

How to update the firmware

To update the firmware on your Intel-based Xserve, follow one of the sets of steps below. You can print these instructions so that they are available while you update the firmware.

Important: Before proceeding with the update, you should write down your current Server Monitor lights-out management settings.

Updating the Lights-Out Management firmware on the Xserve (directly)

A keyboard and display must be connected to the Xserve to perform these steps, as well as a video card to connect the display to.

1. Download the update using Software Update or the `softwareupdate` command line tool--you'll receive a disk image named Xserve LOM Firmware Update 1.1.
2. Mount the Xserve LOM Firmware Update 1.1 disk image.
3. Double-click the LOMUpdate.pkg file on the disk image. This installs the updater in (/Applications/Server) on the selected volume.
4. Go to (/Applications/Server).
5. Double-click Xserve Light-Out Management Firmware Update.
6. Click the Update button.
7. Authenticate as an administrator.

It will take about two minutes to complete the flash and verification. Once complete, the Update application will confirm the successful flash, display the current version, then quit. The Lights-Out Management processor in the Xserve automatically will reboot and should begin running the new firmware without any interruption to Mac OS X Server running on the host.

If an issue occurs during flashing, you may be prompted to perform a full firmware flash, which requires you to restart the server and re-enter the lights-out management settings in Server Monitor. After a full firmware flash, the current version will not be available until after the restart has been performed. You may run the updater again to see the current firmware version.

Updating the Lights-Out Management firmware remotely using Remote Desktop

1. On a Remote Desktop admin computer, download the update using Software Update or the `softwareupdate` command line tool--you'll receive a disk image named Xserve LOM Firmware Update 1.1.
2. Mount the Xserve LOM Firmware Update 1.1 disk image.
3. Copy the package file named "LOMUpdate.pkg" to the desktop of your Remote Desktop admin computer.
4. Open Remote Desktop.
5. Select the target server(s) in your preferred computer list
6. Either drag the "LOMUpdate.pkg" package into the window or choose **Install** from the **Remote Desktop** menu. This installs the updater in (/Applications/Server) on the selected volume.
7. From the **Remote Desktop**, choose **Unix** (for "Send Unix Command").
8. Run the updater on the Xserve by typing the following command on a single line:

```
sudo /Applications/Server/Xserve\\ Lights-Out\\ Management\\ Firmware\\ Update.app/Contents/MacOS/Xserve\\ Lights-Out\\ Management\\ Firmware\\ Update -remote
```

It will take about two minutes to complete the flash and verification. Once complete, the Update application will confirm the successful flash, display the current version, then quit. The Lights-Out Management processor in the Xserve automatically will reboot and should begin running the new firmware without any interruption to Mac OS X Server running on the host.

If an issue occurs during flashing, you may be prompted to perform a full firmware flash, which requires you to restart the server and re-enter the lights-out management settings in Server Monitor. After a full firmware flash, the current version will not be available until after the restart has been performed. You may run the updater again to see the current firmware version.

Updating the Lights-Out Management firmware remotely using Terminal

1. Use Terminal to SSH into the Intel-based Xserve that you wish to update (as an administrator).
2. After connecting via SSH, use the softwareupdate command line tool to install the Xserve LOM Firmware Update. This installs the updater application in the Xserve's (/Application/Server) directory, but does not perform the firmware update itself.
3. To update the firmware, run the updater with this single-line command (in Terminal):

```
sudo /Applications/Server/Xserve\\ Lights-Out\\ Management\\ Firmware\\ Update.app/Contents/MacOS/Xserve\\ Lights-Out\\ Management\\ Firmware\\ Update -remote
```

If your Intel-based Xserve's firmware needs to be updated, the Xserve Lights-Out Management Firmware Updater will display instructions (in English, in the Terminal window). If your firmware is up to date or if an issue occurs, that information will be sent to the Terminal window. If a full update is required, Terminal will display a message indicating that, and you'll need to re-enter your Lights-Out Management settings using Server Monitor when the update is complete.

If an issue occurs during flashing, you may be prompted to perform a full firmware flash, which requires you to restart the server and re-enter the lights-out management settings in Server Monitor. After a full firmware flash, the current version will not be available until after the restart has been performed. You may run the updater again to see the current firmware version.

Windows clients can‘t bind to domain using NTLMv2 if the PDC‘s domain is lower case

This article has been archived and is no longer updated by Apple.

Issue or symptom

Windows clients can't bind to domain using NTLMv2 if the PDC's domain is lower case.

Solution

Use one of these workarounds:

- Use an uppercase domain name (Server Admin -> Windows -> Settings -> General tab)

  or

- When binding the Windows client to the PDC, specify the admin name with the domain name in upper case (`DOMAIN\\diradmin`, for example)

AppleShare IP: Changing Default Port Numbers

The following questions are discussed in this article.

1) I would like to run another service on my Power Macintosh G3 Server besides AppleShare IP, but find that the AppleShare IP HTTP service is using Port 80. I'd like to change the port assignment. How do I accomplish that?

2) I changed the PORT resources to a range of ports made available to me by the network administrator. When I tried to log into the AppleShare server via the Chooser, a 'server not responding' message was displayed.
This article has been archived and is no longer updated by Apple.
1) I would like to run another service on my Power Macintosh G3 Server besides AppleShare IP, but find that the AppleShare IP HTTP service is using Port 80. I'd like to change the port assignment. How do I accomplish that?

Answer) The following modification will allow you to change the port assignments used by the AppleShare IP server. However, the steps provided are unsupported and could result in non-functioning software. Great care should be taken when performing software modifications. Always make a backup of your software prior to performing any changes or modifications.

The following steps refer to the use of the ResEdit utility, available via Apple Software Updates:
ResEdit_2.1.3.sea.bin The ResEdit utility is an unsupported application.

Warning: The instructions in this article refer to using ResEdit to alter your software. Apple, Inc., is not liable for any damage done to your software through the use of ResEdit.

1. Quit all open applications.

2. Make a copy of the "AppleShare IP Web & File" extension located in your System Folder: Extensions folder.

3. Launch the ResEdit application.

4. Using the File: Open dialog box, open the copy of the "AppleShare IP Web & File" extension you created in step 2.

5. ResEdit will display the available resources for the file. Locate and open the resource labeled "PORT."

6. In the PORT window, locate and open the resource ID #1002 "HTTP Port Number."

7. A window displaying the HEX (Base 16) values will appear, with the HEX value "0050" denoting the port value of 80.

8. Using a scientific calculator, convert the desired port number to a HEX value and enter in the number in the location of the current value.

For example, Port 85 would replace the default "0050" with "0055."

9. Close all windows, save your changes and quit ResEdit.

10. Move the original "AppleShare IP Web & File" extension to a safe location and move the modified version of the file into the System Folder: Extensions folder.

11. Restart the computer and startup the AppleShare IP file server.

2) I changed the PORT resources to a range of ports made available to me by the network administrator. When I tried to log into the AppleShare server via the Chooser, a 'server not responding' message was displayed.

Answer) The AppleShare Client looks for the AppleTalk over TCP/IP port number to be 548. The AppleShare Client won't be able to connect to the server if this is changed. There are two ways you can connect to an AppleShare Server whose PORT resource has been changed.

* Use the Chooser's "Server IP Address..." button to manually specify the IP address of the Server, followed by a colon and the new port number.

For example: www.yourdomain.com:xxxx

* Change the default AppleShare port number from the Macintosh client by altering the 'DATB' resource (ID=1407) to match that of the server's new AFP port number.

Note: The client won't be able to connect to another AppleShare IP 5.0 Server whose port number has not been altered, unless you manually

connect via Chooser's "Server IP Address..." button and explicitly specify the port number after the "colon" notation.

Aperture: Importing Images from Leaf Aptus CF Cards

This article has been archived and is no longer updated by Apple.

Issue or symptom

Compact Flash cards formatted on Leaf Aptus cameras do not show up as CF cards in the Aperture Import panel.

Solution

This is an issue with the way the camera formats the CF card. The card shows up as a mounted hard drive. To access the images from the card, click Local Files in the Import panel, and then select the CF card from the list of external volumes. Take care not the use the "Store files in their current location" option when importing images from Leaf CF cards in this way.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: Using a UFS-formatted volume as a startup disk is not recommended

This article has been archived and is no longer updated by Apple.

Using Mac OS X with a UFS-formatted startup ("boot") volume may be possible, but it is not recommended (deprecated).

Published Date: Oct 10, 2016

PowerBook G3 Series: System Reset Key Sequence

This article describes the new key sequence used to reset the computer.
This article has been archived and is no longer updated by Apple.
The Macintosh PowerBook G3 Series has a new key sequence to reset the system: Shift-Fn (function)- Ctrl (control)-Power. This sequence is also printed on the back I/O panel of the PowerBook.

The first three keys are located in the lower left hand corner of the keyboard. The power button is just above the F9 and F10 keys.

This key sequence is the equivalent to a hardware reset button and will reset the Power Management Unit and the PRAM (parameter RAM).

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

About Security Update 2007-004

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2007-004, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2007-004

- **AFP Client**

  CVE-ID: CVE-2007-0729

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A local user may obtain system privileges

  Description: Under certain circumstances, AFP Client may execute commands without properly cleaning the environment. This may allow a local user to create files or execute commands with system privileges. This update addresses the issue by cleaning the environment prior to executing commands.

- **AirPort**

  CVE-ID: CVE-2007-0725

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A local user may be able to execute arbitrary code with elevated privileges

  Description: A buffer overflow vulnerability exists in the AirPortDriver module which processes control commands for AirPort. By sending malformed control commands, a local user could trigger the overflow which may lead to arbitrary code execution with elevated privileges. This issue affects eMac, iBook, iMac, PowerBook G3, PowerBook G4, and Power Mac G4 systems equipped with an original AirPort card. This issue does not affect systems with the AirPort Extreme card. This update addresses the issue by performing proper bounds checking.

- **CarbonCore**

  CVE-ID: CVE-2007-0732

  Available for: Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A local user may be able to execute arbitrary code with elevated privileges

  Description: The CoreServices daemon could allow a local user to obtain a send right to its Mach task port, which may lead to arbitrary code execution with elevated privileges. This update addresses the issue by through improved checks in the CoreServices interprocess communication. This issue does not affect systems prior to Mac OS X v10.4.

- **diskdev_cmds**

  CVE-ID: CVE-2007-0734

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Opening a maliciously-crafted UFS disk image may lead to an unexpected application termination or arbitrary code execution

  Description: A memory corruption vulnerability exists in fsck. It is possible to cause fsck to be run automatically on a disk image when it is opened. By enticing a user to open a maliciously-crafted disk image, or to run fsck on any maliciously-crafted UFS filesystem, an attacker could trigger the issue which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of UFS filesystems.

- **fetchmail**

  CVE-ID: CVE-2006-5867

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: fetchmail may send passwords in plain text, even when configured to use TLS

  Description: fetchmail is updated to version 6.3.6 to fix a vulnerability that could allow authentication credentials to be sent in plain text, despite being configured to use TLS. This issue is described on the fetchmail web site at http://fetchmail.berlios.de/fetchmail-SA-2006-02.txt

- **ftpd**

  CVE-ID: CVE-2006-6652

  Available for: Mac OS X v10.3.9, Mac OS X v10.4.9

  Impact: FTP operations by authenticated FTP users may lead to arbitrary code execution

  Description: lukemftpd has been updated to version tnftpd 20061217 to address a buffer overflow vulnerability in the handling of commands with globbing characters that could lead to arbitrary code execution. This issue does not affect Mac OS X Server v10.3.9 or Mac OS X Server v10.4.9. Credit to Kevin Finisterre of DigitalMunition for reporting this issue.

- **GNU Tar**

  CVE-ID: CVE-2006-0300

  Available for: Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Listing or extracting a maliciously-crafted tar archive may lead to an unexpected application termination or arbitrary code execution

  Description: A buffer overflow vulnerability exists in the handling of PAX extended headers in GNU tar archives. By enticing a local user to list or extract a maliciously-crafted tar archive, an attacker can trigger the overflow which may lead to an unexpected application termination or arbitrary code execution. This issue has been addressed by performing additional validation of tar files. This issue does not affect systems prior to Mac OS X 10.4.

- **Help Viewer**

  CVE-ID: CVE-2007-0646

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Opening a help file with a maliciously-crafted name may lead to an unexpected application termination or arbitrary code execution

  Description: A format string vulnerability exists in the Help Viewer application. By enticing a user to download and open a help file with a maliciously-crafted name, an attacker can trigger the vulnerability which may lead to an unexpected application termination or arbitrary code execution. This has been described on the Month of Apple Bugs web site (MOAB-30-01-2007). This update addresses the issue by eliminating any format string processing of file names.

- **HID Family**

  CVE-ID: CVE-2007-0724

  Available for: Mac OS X v10.4 through Mac OS X v10.4.9, Mac OS X Server v10.4 through Mac OS X Server v10.4.9

  Impact: Console keyboard events are exposed to other users on the local system

  Description: Insufficient controls in the IOKit HID interface allow any logged in user to capture console keystrokes, including passwords and other sensitive information. This update addresses the issue by limiting HID device events to processes belonging to the current console user. Credit to Andrew Garber of University of Victoria, Alex Harper, and Michael Evans for reporting this issue. This fix was originally distributed via the Mac OS X v10.4.9 update. However, due to a packaging issue it may not have been delivered to all systems. This update redistributes this fix in order to reach all affected systems.

- **Installer**

  CVE-ID: CVE-2007-0465

  Available for: Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Opening an installer package with a maliciously-crafted name may lead to an unexpected application termination or arbitrary code

execution

Description: A format string vulnerability exists in the Installer application. By enticing a user to download and install an installer package with a maliciously-crafted file name, an attacker can trigger the vulnerability which may lead to an unexpected application termination or arbitrary code execution. This issue has been described on the Month of Apple Bugs web site (MOAB-26-01-2007). This update addresses the issue by eliminating any format string processing of file names. This issue does not affect systems prior to Mac OS X v10.4.

- **Kerberos**

  CVE-ID: CVE-2006-6143

  Available for: Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Running the Kerberos administration daemon may lead to an unexpected application termination or arbitrary code execution with system privileges.

  Description: An uninitialized function pointer vulnerability exists in the MIT Kerberos administration daemon (kadmind), which may lead to an unexpected application termination or arbitrary code execution with system privileges. Further information on the issue and the patch applied is available via the MIT Kerberos website at http://web.mit.edu/kerberos/advisories/MITKRB5-SA-2006-002-rpc.txt. This issue does not affect systems prior to Mac OS X v10.4. Credit to Andrew Korty of Indiana University for reporting this issue to the MIT Kerberos Team.

- **Kerberos**

  CVE-ID: CVE-2007-0957

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Running the Kerberos administration daemon or the KDC may lead to an unexpected application termination or arbitrary code execution with system privileges.

  Description: A stack buffer overflow vulnerability exists in the MIT Kerberos administration daemon (kadmind), as well as the KDC, which may lead to an unexpected application termination or arbitrary code execution with system privileges. Further information on the issue and the patch applied is available via the MIT Kerberos website at http://web.mit.edu/kerberos/advisories/MITKRB5-SA-2007-002-syslog.txt. Credit to the MIT Kerberos Team and an anonymous researcher working with iDefense for reporting this issue.

- **Kerberos**

  CVE-ID: CVE-2007-1216

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Running the Kerberos administration daemon may lead to an unexpected application termination or arbitrary code execution with system privileges

  Description: A double-free vulnerability exists in the GSS-API library used by the MIT Kerberos administration daemon (kadmind), which may lead to an unexpected application termination or arbitrary code execution with system privileges. Further information on the issue and the patch applied is available via the MIT Kerberos website at http://web.mit.edu/kerberos/advisories/MITKRB5-SA-2007-003.txt. Credit to the MIT Kerberos Team for reporting this issue.

- **Libinfo**

  CVE-ID: CVE-2007-0735

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Visiting malicious websites may lead to an unexpected application termination or arbitrary code execution

  Description: In some cases, Libinfo does not correctly report errors to applications that use it. By enticing a user to visit a maliciously-crafted web page, an attacker can cause a previously deallocated object to be accessed, which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing appropriate error reporting in Libinfo. Credit to Landon Fuller of Three Rings Design for reporting this issue.

- **Libinfo**

  CVE-ID: CVE-2007-0736

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Remote attackers may be able to cause a denial of service or arbitrary code execution if the portmap service is enabled

Description: An integer overflow vulnerability exists in the RPC library. By sending maliciously-crafted requests to the portmap service, a remote attacker can trigger the overflow which may lead to a denial of service or arbitrary code execution as the 'daemon' user. This update addresses the issue by performing additional validation of portmap requests. Credit to the Mu Security Research Team for reporting this issue.

- **Login Window**

  CVE-ID: CVE-2007-0737

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A local user may obtain system privileges

  Description: Login Window does not sufficiently check its environment variables. This could allow a local user to execute arbitrary code with system privileges. This update addresses the issue by through improved validation of Login Window environment variables.

- **Login Window**

  CVE-ID: CVE-2007-0738

  Available for: Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: The screen saver authentication dialog may be bypassed

  Description: Under certain conditions, the user's preference to "require a password to wake the computer from sleep" is ignored, and a password is not required to wake from sleep. This update addresses the issue by through improved handling of this preference.

- **Login Window**

  CVE-ID: CVE-2007-0739

  Available for: Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: The loginwindow authentication dialog may be bypassed

  Description: Under certain conditions, the software update window may appear beneath the Login Window. This could allow a person with physical access to the system to log in without authentication. This update addresses the issue by only running scheduled tasks after the user login. This issue does not affect systems prior to Mac OS X v10.4.

- **network_cmds**

  CVE-ID: CVE-2007-0741

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Remote attackers may be able to cause a denial of service or arbitrary code execution if Internet Sharing is enabled

  Description: A buffer overflow vulnerability exists in the handling of RTSP packets in natd. By sending malformed RTSP packets, a remote attacker may be able to trigger the overflow which may lead to arbitrary code execution. This issue only affects users who have Internet Sharing enabled. This update addresses the issue by performing additional validation of rtsp packets.

- **SMB**

  CVE-ID: CVE-2007-0744

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A local user may obtain system privileges

  Description: Under certain circumstances, SMB may execute commands without properly cleaning the environment. This may allow a local user to create files or execute commands with system privileges. This update addresses the issue by cleaning the environment prior to executing commands.

- **System Configuration**

  CVE-ID: CVE-2007-0022

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Local admin users may execute arbitrary code with system privileges without authentication

Description: Admin users have the ability to alter system preferences through the writeconfig utility. When the writeconfig utility launches the launchctl utility, it does not clean the environment inherited from the user. This could allow arbitrary code execution with system privileges without authentication. This issue has been described on the Month of Apple Bugs web site (MOAB-21-01-2007). This update addresses the issue by cleaning the environment before calling the launchctl utility.

- **URLMount**

  CVE-ID: CVE-2007-0743

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A local users may obtain other user's authentication credentials

  Description: The username and password used to mount remote filesystems through connections to SMB servers are passed to the mount_smb command as command line arguments, which may expose them to other local users. This update addresses the issue by securely passing the authentication credentials to the mount_smb command. Credit to Daniel Ball of Pittsburgh Technical Institute, Geoff Franks of Hauptman Woodward Medical Research Institute, and Jamie Cox of Sophos Plc for reporting this issue.

- **VideoConference**

  CVE-ID: CVE-2007-0746

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Remote attackers may be able to cause an unexpected application termination or arbitrary code execution if iChat is running.

  Description: A heap buffer overflow vulnerability exists in the VideoConference framework. By sending a maliciously-crafted SIP packet when initializing an audio/video conference, an attacker can trigger the overflow which may lead to arbitrary code execution. This update addresses the issue by performing additional validation of SIP packets.

- **WebDAV**

  CVE-ID: CVE-2007-0747

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A local user may obtain system privileges

  Description: When mounting a WebDAV filesystem, the load_webdav program may be launched without properly cleaning the environment. This may allow a local user to create files or execute commands with system privileges. This update addresses the issue by cleaning the environment prior to executing commands.

- **WebFoundation**

  CVE-ID: CVE-2007-0742

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: Cookies set by subdomains may be accessible to the parent domain

  Description: An implementation issue allows cookies set by subdomains to be accessible to the parent domain, which may lead to the disclosure of sensitive information. This update addresses the issue by performing additional validation of the domain to which a cookie is being sent. This issue does not affect systems running Mac OS X v10.4. Credit to Bradley Schwoerer of University of Wisconsin-Madison for reporting this issue.

Mac OS X 10.4: Restart or shutdown delay if AFP volume is mounted but server may not be contacted.

This article has been archived and is no longer updated by Apple.

Issue or symptom

If an AFP volume is mounted, but the server becomes unavailable and cannot be contacted, significant delays may occur when trying to shut down or restart the computer.

Solution

As a workaround, unmount any AFP volumes before restarting or shutting down. If volumes were not unmounted, wait until Mac OS X completes the AFP timeout.

If you have waited a considerable amount of time, you can force restart the computer:

- Hold the computer's power button until it turns off.
- Advanced option: If ssh is enabled on the computer, try to ssh into the affected system with an administrator account and perform the following command to force restart: `sudo reboot`

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Mac OS X 10.4: Recently-copied files disappear from improperly unmounted volume

This article has been archived and is no longer updated by Apple.

Issue or symptom

Files copied to a disk that is improperly unmounted or disconnected may not appear on the disk when it is connected again. For example, if you disconnect an external FireWire-based hard disk from your computer without first unmounting the volume in the Finder or Disk Utility, this issue may occur.

Solution

Properly unmount the volume before disconnecting the disk.

If this issue occurs, you should use Disk Utility to verify that the volume is free of directory damage. Repair the volume if any directory issues are detected. Then, copy the data to the volume again (and unmount it correctly).

Additional information

This can happen if the disk cache is not emptied ("flushed") due to an improper unmount of the destination volume.

Published Date: Feb 20, 2012

Mac OS X volume does not appear in Finder or on the desktop after restart or log in

After the installation of some Mac OS X updates (for example, the Mac OS X 10.4.9 Update), you may notice that the start up (boot) volume no longer appears in Finder windows (such as when using **Go -> Computer**) or on the desktop (if this preference is enabled).

This article has been archived and is no longer updated by Apple.

1. Use the Mac OS X installation disc that shipped with your computer to install Xcode, or download it from the Apple Developer Connection and install it.
2. Open Terminal (in the Utilities folder). Type this command, followed by Return:

   ```
   sudo /Developer/Tools/SetFile -a v /
   ```

   Note: The sudo command requires an admin user account with a non-blank password.
3. Restart.

PowerBook G3 Series: Mac OS Extended Format Compatibility Issues

This article discusses compatibility issues with the PowerBook G3 Series' new and improved file format called Mac OS Extended format.
This article has been archived and is no longer updated by Apple.
Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

The PowerBook G3 Series' hard disk uses a new, improved file format called Mac OS Extended format (sometimes called HFS Plus). Mac OS Extended format has two benefits: it increases the number of files you can store on your hard disk, and it lets your computer work with data more efficiently than previous formats.

Using Norton Utilities
Norton Utilities version 3.5 is not compatible with Mac OS Extended format. When version 3.5.3 or 3.5.2 detects a Mac OS Extended format drive, it will not attempt to repair the drive.

Warning: Norton Utilities versions 3.5.1 and earlier cannot recognize that a hard disk is in Mac OS Extended format . Using Norton Utilities version 3.5.1 or earlier on your hard disk can result in hard disk corruption and loss of all your data.

If you experience problems with your hard disk, Apple Computer recommends using the version of Disk First Aid included on your system software CD. See the Symantec Web site for more information on Norton Utilities and Mac OS Extended format.

Using Other Hard Disk Utility and Disk Locking Programs
Some other disk utility and disk locking programs are incompatible with Mac OS Extended format. Before you attempt to use a disk utility or disk locking program, make sure the version you have is compatible with Mac OS Extended format. Check the documentation that came with the program or contact the manufacturer or the vendor that supplied the program.

Using SCSI Disk Mode
To use your PowerBook in SCSI disk mode, the computer to which you are connecting your PowerBook must have Mac OS 8.1 or later installed. If the computer has an earlier version of system software, you will not be to access your PowerBook's hard disk.

PowerBook G3 Series: Wake on Ring not Supported

This article discusses the Wake on Ring function of the PowerBook G3 Series.
This article has been archived and is no longer updated by Apple.
Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

Wake on Ring function is not supported on the Macintosh PowerBook G3 Series system. The Wake on Ring function allows the system to wake up when an incoming phone call is detected on the modem port.

The Energy Saver control panel contains the option "Wake up when the modem detects a ring" under the Network Connections section. On the PowerBook G3 Series, you will see this option with it?s checkbox grayed out. Although this may give the impression some additional hardware or software will enable this function, as an unsupported feature, no changes to the system will enable the check box.

Figure 1, Energy Saver control panel

Mac OS X Server 10.4.9,10.4.10: Mac OS 9 client cannot copy some files via AFP

This article has been archived and is no longer updated by Apple.

Issue or symptom

File larger than about 1.5 MB may not successfully copy from a Mac OS 9.2.2 client to Mac OS X Server 10.4.9 via AFP. The copy may stop and this alert may appear:

> "The file server's connection has unexpectedly closed down."

Solution

Download and install the Mac OS X Server 10.4.11 Update or later.

Samsung D600, D900: Issues syncing events with iCal in Mac OS X 10.5

This article has been archived and is no longer updated by Apple.

Samsung D600 and D900 Bluetooth cellular phones may contain firmware that may cause any of the following issues to occur when creating or synching events with iCal in Mac OS X 10.5 Leopard:

- A note or timed event that's added to a previously created event may not sync with iCal.
- Anniversary events created on the phone may not display a title in iCal after synching. You may notice the "Occasion" field appears instead in the "Notes" section (of an event) in iCal.
- Anniversary events created on the phone with "Occasion" and "Date" fields may appear incorrectly as all-day events that occur on the following day, after being synched.

This document will be updated as more information becomes available.

iSync 2.4: Issues syncing Motorola E815 phone via Bluetooth

This article has been archived and is no longer updated by Apple.

Issue or symptom

When trying to pair sync a Verizon-issued Motorola E815 phone with iSync, this alert may appear:

"iSync Cannot Connect With This Device"

Solution

Connect the phone to the computer with a USB cable instead of using Bluetooth.

Due to firmware differences, some Verizon-based phones manufactured by Motorola may not be recognized by iSync 2.4.

About Security Update 2007-004 v1.1

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2007-004 v1.1, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2007-004 v1.1

Security Update 2007-004 v1.1 includes the contents of Security Update 2007-004, plus the following fixes:

- **AirPort**

  Available for: Mac OS X v10.3.9

  This update corrects an issue where the AirPort connection may be lost after waking from sleep. This issue only affects Mac OS X v10.3.9 with Security Update 2007-004.

- **FTPServer**

  CVE-ID: CVE-2007-0745

  Available for: Mac OS X Server v10.4.9

  Impact: Users with ftp access may be able to navigate to directories outside the normal scope

  Description: Security Update 2007-004 applied an incorrect ftp configuration file for Mac OS X Server v10.4.9 systems. Users with ftp access, who would normally be restricted to certain directories, may be able to access directories outside the normal scope. This update addresses the issue by restoring the correct version of the ftp configuration file. This issue only affects Mac OS X Server v10.4.9 with Security Update 2007-004.

Mac OS X 10.4.9 (client) and Mac OS X Server 10.3.9 systems that have installed Security Update 2007-004 do not require Security Update 2007-004 v1.1. If the security update has not yet been installed on these systems, then they should be updated using Security Update 2007-004 v1.1.

"iSync does not support the device" alert, or red dot appears next to device icon

This article has been archived and is no longer updated by Apple.

Issue or symptom

- When opening iSync, a red dot may appear next to your device icon(s), or an "iSync does not support the device" alert message may appear.
- Clicking a device's icon may cause an "iSync does not support the device" alert message to appear.

This might happen if an incompatible third-party device plug-in has been installed, or if a compatible plug-in for the device was removed, or in other situations.

Solution

If your phone or device is listed on the iSync Compatibile Devices Page:

1. Remove the phone or device (that appears with a red dot next to it) from iSync.
2. Reinstall the third-party plug-in that allows the device to work with iSync.
3. Add the device back to iSync. (To learn about adding a Bluetooth-based phone, see this article; for a USB-based phone, see this article.)

If your phone or device is *not* listed on the iSync Compatibile Devices Page, contact the device's manufacturer to see if a compatible plug-in is available. If no plug-in is available, remove the device/phone from iSync.

Additional information

Some phones may require the use of a third-party or USB cable to work with iSync. Some Palm devices require that Palm Desktop 4.2.1 or later software be installed; Pocket PC and Palm OS-based PDAs require third-party software.

See also: "iSync 2.2 or later: Some phones may require a firmware update".

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Open Transport: DHCP Leases

When I use a DHCP server to assign an IP address, it does not maintain the IP address upon the next restart. What is causing this?
This article has been archived and is no longer updated by Apple.
The DHCP specification (RFC 2131) does not guarantee that a client computer will always receive the same IP address on every startup. The permanency of a particular IP address is largely determined by the configuration of the DHCP server. For maximum permanency, the DHCP server should be configured so that a specific IP address is reserved for a particular client computer.

However, there are a couple of provisions in the DHCP specification that may minimize the number of IP address changes:

1) Retaining Lease Across Restarts (DHCP INIT-REBOOT)

Starting with Mac OS 8.5, which ships with Open Transport 2.0, the DHCP client will automatically attempt to retain its lease between restarts by asking for a new lease on its previous IP address. Depending on the DHCP server implementation, the client may or may not receive a new lease on the same IP address.

Prior to Mac OS 8.5, with Open Transport 1.x, the DHCP client did not attempt to retain its lease between restarts. Upon restart, it would always ask for any new lease. Depending on the DHCP server implementation, the client may or may not receive a new lease on the previous IP address.

2) Using The Remainder Of Lease If Server Unavailable

In any version of Mac OS, if the DHCP server is unavailable on startup, the DHCP client will not attempt to use the remainder of its lease. This may increase the likelihood that a different IP address will be provided once communications with the DHCP server are once again available.

Xserve RAID: Disable Controller Write Cache when using JBOD mode

This article has been archived and is no longer updated by Apple.

You should disable the "Use Controller Write Cache" feature when using an Xserve RAID in JBOD ("Just a Bunch of Disks") mode.

To disable "Use Controller Write Cache"

1. Open Xserve RAID.
2. From the Main menu, choose Settings.
3. Choose Performance.
4. Deselect the "Use Controller Write Cache" option.

Additional information

The Xserve RAID Controller Write Cache queues data before it is written to the disks. In the unlikely event that queued data cannot be written to a hard drive that is a member of an Xserve RAID in JBOD mode, there is a possibility that the data could be lost, unless you disable the "Use Controller Write Cache" feature.

Apple Wireless Keyboard: Cleaning the battery contacts

This article has been archived and is no longer updated by Apple.

The Apple Wireless Keyboard is powered by batteries that you install in the compartment on the underside of the keyboard. To clean the battery contacts in the battery compartment, remove the batteries and rub a clean pencil eraser over the two flat (positive) contact surfaces.

Cleaning the (negative) spring contacts is not necessary.

After cleaning the contacts, turn the keyboard over and remove any residue that the eraser may have left in the battery tray. Reinsert the batteries (or install fresh ones) replace the battery tray cover, and slide the keyboard power switch to On. The green power LED should light up, then flash, as it pairs with the computer. The LED will go off after the keyboard is paired up.

Additional information

The battery contacts can develop a coating that could prevent enough power from getting to the keyboard. This could prevent the keyboard's Bluetooth transmitter from pairing with the computer your attempting to use it with.

Mac OS X: About the Send PDF to iPhoto feature

This article has been archived and is no longer updated by Apple.

Mac OS X 10.4 and later include an option that allows you to send a picture to iPhoto using the PDF workflow feature of the print dialog. You can access this feature by selecting "Send PDF to iPhoto" from the PDF menu in the print dialog.

This feature uses an Automator workflow to create a PDF printout, and then convert that PDF to a JPEG. The JPEG is then sent to iPhoto. This workflow is installed by Mac OS X and is stored in `/Library/PDF Services/`.

Some important notes about this feature:

- What is imported in iPhoto is a JPEG representation of the PDF, not the PDF itself.
- This feature works with iPhoto 6 or later.

To learn more about creating your own PDF workflows, visit the AppleScript and Automator sections of the Apple website:

- http://www.apple.com/macosx/features/automator/
- Setting up workflows for creating PDF files
- Running a workflow on a PDF in the Print dialog
- Saving a workflow as a plug-in

NetBoot service item is dimmed in Server Admin 10.4 and can‘t be administered

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Netboot or other service list items in Server Admin Computers & Services column may be dimmed ("grayed out"). Dimmed items cannot be administered in Server Admin.

Solution

1. On the affected server, quit Server Admin.
2. Delete the /var/servermgrd/ directory.
3. In Terminal, execute this command:

   ```
   sudo launchctl stop com.apple.servermgrd
   ```
4. Restart Server Admin.

About the security content of Darwin Streaming Server 5.5.5

This article has been archived and is no longer updated by Apple.

This document describes the security content of Darwin Streaming Server 5.5.5. Darwin Streaming Server is an open source project available via: (http://developer.apple.com/opensource/server/streaming/index.html).

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Darwin Streaming Server 5.5.5

- **Darwin Streaming Server**

  CVE-ID: CVE-2007-0749

  Impact: A remote attacker may be able to cause an unexpected application termination or arbitrary code execution

  Description: A stack buffer overflow exists in the Darwin Streaming Proxy. By sending maliciously-crafted RTSP requests, a remote attacker can trigger the overflow, which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of RTSP requests. Credit to an anonymous researcher working with the iDefense VCP for reporting this issue.

- **Darwin Streaming Server**

  CVE-ID: CVE-2007-0748

  Impact: A remote attacker may be able to cause an unexpected application termination or arbitrary code execution

  Description: A heap buffer overflow exists in the Darwin Streaming Proxy. By sending maliciously-crafted RTSP requests, a remote attacker can trigger the overflow, which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of RTSP requests. Credit to an anonymous researcher working with the iDefense VCP for reporting this issue.

ARA 3.0: Incompatible with PowerBook 150 Internal Modem Control Panel

If you install ARA 3.0 or OT/PPP on a PowerBook 150, the internal modem may not function.
This article has been archived and is no longer updated by Apple.
If you open the Modem control panel, the "Connect via:" pop-up menu will not allow you to switch from "Modem/Printer Port" to "Internal Modem".

Because of this, the Remote Access or PPP control panel will attempt to dial through the external serial port and will either not receive a dial tone or report that the port is busy. The same will be true for other communications programs that rely on the settings in the Modem control panel.

The only workarounds for this problem at this time are:

- Use something other than ARA 3.0 and OT/PPP (ARA 2.1 and FreePPP for example)
- Use an external modem.

Final Cut Pro: Digital Cinema Desktop displays white

This article has been archived and is no longer updated by Apple.

Issue

Final Cut Pro's Digital Cinema Desktop feature may display a blank white image instead of your video, if it is viewed on a display that is connected to a second graphics card.

Solution

Final Cut Pro is able to display its content on one or two computer displays, but in order to utilize the Digital Cinema Desktop feature on your secondary display, it will need to be connected to a second port on your main graphics card. Digital Cinema Desktop is not supported on a display that is not connected to your primary graphics card.

iChat: Some Buddy List icons don‘t look like they should

This article has been archived and is no longer updated by Apple.

Issue or symptom

Icons of buddies on your iChat Buddy List may sometimes appear as a blue globe, white square, or appear with no icon. This can happen with both AIM- and .Mac-based accounts.

Solution

Server issues on the AIM network can cause this issue. If you are affected, contact America Online for more information.

Note that text, audio, and video chats will still work--this issue affects icon appearance only.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Final Cut Studio 2: About the Outer Glow filter

This article has been archived and is no longer updated by Apple.

Final Cut Pro 6 includes a video filter called Outer Glow. You may already be familiar with this filter, as it was also available in Motion 2. In Final Cut Studio 2, the Outer Glow filter is available in both applications, but in some cases, its behavior in Final Cut Pro is slightly different than it is in Motion.

The Outer Glow filter adds a glow to the outer border of an object's alpha channel. For example, if you add Outer Glow to text in Motion or Final Cut Pro, the text will have the glow applied to its edges, giving the appearance of a glowing outline for the characters.

Issue

If you add the Outer Glow filter to a video clip (or still image), there can be a difference in effect between what you might see in Final Cut Pro versus Motion.

- In Motion, the glow will be applied to the edges of the clip, essentially extending the size of the object by the radius of the glow on each edge.
- In Final Cut Pro, a clip's edges describe its total visible area. If you apply the Outer Glow filter to a clip that has no alpha channel, there will be no visible change, because Final Cut Pro doesn't display anything beyond the edges of a clip.

Workaround

You can achieve the same effect in Final Cut Pro as in Motion by nesting. The following steps describe one way to apply the Outer Glow filter to the edges of a clip in Final Cut Pro.

1. Add a clip to the Timeline.
2. Double-click that clip in the Timeline.
3. Use the wireframe handles in the Canvas (or the Scale parameter in the Viewer) to scale the clip down to the desired size.
4. Choose **Sequence > Nest Item(s)**.
5. Click **OK** in the Nest Items window that appears.
6. Click once on the newly-nested sequence in the Timeline to select it.
7. Choose **Effects > Video Filters > Glow > Outer Glow**.

Now you should see the effect applied to the edges of the nested clip.

Published Date: Feb 20, 2012

QuickTime: Enhanced podcasts created in iWeb display "?" in Safari after QuickTime 7.1.6 update

This article has been archived and is no longer updated by Apple.

Issue or symptom

After updating to QuickTime 7.1.6, enhanced podcasts (podcasts with added images) in websites created with iWeb may display a QuickTime logo with a question mark in Safari.

Solution

To resolve this issue, install QuickTime 7.2.

Published Date: Feb 20, 2012

iWeb 1.x: Password-protected sites don‘t publish to .Mac

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you try to publish a site to .Mac with user name and password protection, an alert message "There was an error updating .Mac" may appear. This happens if you use upper case letters in the user name.

Solution

When choosing a user name and password, use the following guidelines:

Note: This issue is resolved in iWeb 2.x.

User name

- The user name can only contain characters from this set: `0123456789_.abcdefghijklmnopqrstuvwxyz` (lower case letters only).
- It must start with a letter.
- It cannot end with a period.
- It cannot contain two periods in a row.
- It must be between 3 and 20 characters.

Password

- The password may only contain characters from this set: `!\\"#$%&'()*+,-./0123456789:;<=>?@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\\\\]^_`abcdefghijklmnopqrstuvwxyz{|}` (upper or lower case letters are allowed).
- It cannot end with a period.
- It cannot contain two periods in a row.
- It must be between 6 and 20 characters.

Published Date: Feb 20, 2012

Security Update 2007-004 may affect SQL Anywhere 9, IBM Workplace Forms Viewer, some other applications

This article has been archived and is no longer updated by Apple.

Issue or symptom

Applications that use the DYLD_LIBRARY_PATH environmental variable may have issues after installing Security Update 2007-004.

Products affected

- SQL Anywhere 9
- IBM Workplace Forms Viewer
- Other applications that use the DYLD_LIBRARY_PATH environmental variable

Solution

Check with the application's vendor to see if a later version is available (that is, a newer version of the application that does not depend on the DYLD_LIBRARY_PATH environmental variable).

If no updated version is available, you can use one of the following workarounds to avoid the issue.

Workaround: Edit the application's info.plist

This workaround is recommended because it does not reintroduce the vulnerability that was addressed by Security Update 2007-004.

1. Quit the affected application if it is running.
2. Go to the application's icon in the Finder.
3. Control-click or right-click the application's icon.
4. From the contextual menu that appears, choose Show Package Contents.
5. Open the Contents folder.
6. Open the "info.plist" file in a text editor, such as TextEdit.
7. Add the following to the file:

```
<key>LSEnvironment</key>
<dict>
<key>VARIABLE</key>
<string>VALUE</string>
</dict>
```

Note: If you later wish to undo this change, edit the info.plist file again and remove the text you added above.

Workaround: Use Terminal

1. Log in as an administrator.
2. Open Terminal (/Applications/Utilities).
3. Type this command on a single line, followed by Return.

```
sudo touch /var/db/.AllowDYLDEnvironmentVariables
```

Note: This workaround will reintroduce the DYLD_LIBRARY_PATH environmental variable vulnerability that was addressed by Security Update 2007-004. After installing a version of the affected application that does not depend on the DYLD_LIBRARY_PATH environmental variable, you should use this Terminal command to "undo" the command in step 3 above:

```
sudo rm /var/db/.AllowDYLDEnvironmentVariables
```

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Identifying your AirPort Extreme (802.11n) base station

This article has been archived and is no longer updated by Apple.

When configuring multiple AirPort Extreme (802.11n) base stations in AirPort Utility, it may not be obvious which base station you are working with.

AirPort Utility makes it easy to identify your base station:

1. Select a base station from the list on the left side of the AirPort Utility window.
2. Click Continue, or manually configure your base station by pressing Command-L or by choosing **Manual Setup** from the **Base Station** menu.
3. Enter the administrator password for the base station if prompted.
4. Choose **Identify...** from the **Base Station** menu. The base station's status light will begin flashing amber and green and this alert will appear:

   "**Identify**
   The status light on the selected AirPort Extreme is now flashing amber and green."

To stop the lights from flashing, click "Stop Flashing".

Published Date: Feb 20, 2012

Fetch 5 does not connect via FTP, "unrecognized protection level" alert

This article has been archived and is no longer updated by Apple.

Issue or symptom

When using Fetch 5 with a GSSAPI connection to Mac OS X Server, the connection may not succeed. An alert may appear in Fetch stating that there is an "unrecognized protection level".

Solution

As a workaround, deselect "Encrypted Connection" in the Fetch connection window.

Additional information

By default, Fetch 5 tries to establish an encrypted FTP connection. The FTP server in Mac OS X Server does not support this type of protection.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Feb 20, 2012

Xsan: Client computer stops responding after moving item(s) to Trash

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Finder of an Xsan client may stop responding ("hang") indefinitely if an item residing on a StorNext filesystem is moved to the Trash. This alert may also appear:

> "Preparing move to 'Trash'."

This can happen if you have enabled Trash Manager on your SNSM filesystem(s),

Products affected

- StorNext 3.0 and earlier
- Xsan (all versions)

Solution

Follow these steps to replace the .Trashes directory (which is used by the Finder) with a single file named ".Trashes". After following these steps, the client's Finder will immediately delete files instead of storing until Trash is emptied (similar to how Trash is deleted immediately from network-mounted volumes).

On the client computer:

1. Open Terminal
2. Execute these commands, each on a single line. Change [FilesystemName] to the name of your StorNext filesystem.

```
sudo rm -r /Volumes/[FilesystemName]/.Trashes

sudo touch /Volumes/[FilesystemName]/.Trashes
```

Additional information

Both the Finder and the StorNext Storage Manager (SNSM) Trash Manager manage trash handling.

Published Date: Feb 20, 2012

Motion: Video artifacting may occur if VRAM becomes full

This article has been archived and is no longer updated by Apple.

Issue or symptom

When Motion is running, and the Video RAM (VRAM) in your graphics card becomes full, it's possible for the display of objects in Motion to become corrupted. This can occur on video cards that meet the System Requirements for Motion, and is more likely to occur on cards that have a relatively low amount of VRAM.

This issue only affects the display of in-project imagery. In other words, Motion's GUI elements are not affected. Also, if this issue occurs, the display of other applications and Mac OS X elements are not affected.

These images illustrate how the artifacts might appear.

The image above illustrates the user's intended effect: A particle system with many star objects.

This image shows the same as above, but with some texture corruption becoming visible as the number of particles increases.

This image shows another frame from the same project as those above.

Solution

For Intel-based Macs, download and install the Mac OS X 10.4.10 Update or later.

If you have a PowerPC-based Mac, consider these workarounds:

In the interest of minimizing occurrences of this issue, try these actions to make more VRAM available to Motion:

- Quit as many other applications as practical. This issue can especially be affected by applications that process or display graphics (or otherwise vie for VRAM).
- If the project uses large still images, try changing the setting for Large Stills in Motion Preferences to **Down-Res to Canvas Size**. Using fewer and/or smaller images may also help.
- Use fewer and/or smaller video files.
- Use fewer particles in particle systems.
- Use a lower bit depth setting in Project Properties.
- Occurrence of this issue can be somewhat random. It may be worthwhile to save the project and quit Motion, and then open the project again.

Published Date: Feb 20, 2012

Quartz Extreme requires millions of colors

This article has been archived and is no longer updated by Apple.

Issue or symptom

Quartz Extreme is disabled if you use a color setting of Thousands or 256 colors in Display preferences (16-bit and 8-bit, respectively). When Quartz Extreme is disabled in these color modes, you may not be able to use iMovie, and some Mac OS X effects may not render properly (such as the cube effect when changing users via Fast User Switching, or the ripple effect when adding widgets in Dashboard).

Solution

Open Displays preferences and select Millions from the Colors pop-up menu.

Related articles

Xserve: Receiving Software Update notifications on a "headless" configuration

This article has been archived and is no longer updated by Apple.

Issue or symptom

An Xserve without a display connected to it ("headless") may not receive Software Update notifications. In this case, no available updates are listed in Software Update.

Solution

Use one of the following workarounds.

- Use the softwareupdate command-line tool in Terminal to list and install updates. For more information about softwareupdate, type "`man softwareupdate`" in Terminal, or refer to the Command Line Administration documentation here.

- Use Server Admin, instead, to check for and install updates.
- Create a launchd job to automate the process. For more information about launchd and why it's preferred over cron, see Getting Started with launchd.

- Create a cron job to automate the process. You can find more information about cron jobs in this article or via these Terminal commands:

```
man 8 cron
man 1 crontab
man 5 crontab
```

Published Date: Feb 20, 2012

Portables: Keycap Replacement

Two types of keycaps are on the keyboard. The smaller number, letter, function, and arrow keys can be very easily snapped back in place if they come off. The remaining large keys (such as the spacebar) require more care to replace them.
This article has been archived and is no longer updated by Apple.

Keycap Replacement

Step 1

With the U-shaped clip in place, use a plastic tool to tuck the rubber plunger under the black circular opening. See Figure 1.

Figure 1 Plunger and clip

Step 2

Insert the top clip so that the side pins face downward. See Figure 2.

Figure 2 Pins

Step 3

Slide the top clip forward so that its slotted end is caught beneath the black hook on top of the keyswitch location.

Step 4

Press the top clip down carefully, taking care not to pop out the plunger.

Step 5

Bow out the "arms" of the U-shaped clip to lock the pins inside the U-shaped clip. The locked clips should lie flat.

Spacebar Replacement

Follow these steps to replace the spacebar. See Figure 3.

Step 1

Make sure the plunger mechanism is reassembled per the keycaps instructions.

Step 2

Secure the ends of the keycap's metal bar to the hooks on the keyswitch location.

Step 3

Align the keycap over the locked clips and press down.

Figure 3 Spacebar replacement

About Security Update 2007-005

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2007-005, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2007-005

- **Alias Manager**

  CVE-ID: CVE-2007-0740

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Users may be misled into opening a substituted file

  Description: In certain circumstances, an implementation issue in Alias Manager will not show identically-named files contained in identically-named mounted disk images. By enticing a user to mount two identically-named disk images, an attacker could mislead the user into opening a malicious program. This update addresses the issue by performing additional validation of mountpaths. Credit to Greg Bolsinga of Blurb, Inc. for reporting this issue.

- **BIND**

  CVE-ID: CVE-2007-0493, CVE-2007-0494, CVE-2006-4095, CVE-2006-4096

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Multiple vulnerabilities in BIND, the most serious of which is remote denial of service

  Description: BIND is updated to version 9.3.4. Further information is available via the ISC web site at http://www.isc.org/index.pl?/sw/bind/

- **CoreGraphics**

  CVE-ID: CVE-2007-0750

  Available for: Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Opening a maliciously crafted PDF file may lead to an unexpected application termination or arbitrary code execution

  Description: An integer overflow vulnerability exists in the handling of PDF files. By enticing a user to open a maliciously crafted PDF file, an attacker could trigger the overflow which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of PDF files. This issue does not affect systems prior to Mac OS X v10.4.

- **crontabs**

  CVE-ID: CVE-2007-0751

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: The daily /tmp cleanup script may lead to a denial of service

  Description: Filesystems mounted in the /tmp directory may be deleted when the daily cleanup script is executed, which may lead to a denial of service. This update addresses the issues by updating the daily cleanup script to prevent find commands from descending into mounted filesystems.

- **fetchmail**

  CVE-ID: CVE-2007-1558

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

Impact: fetchmail password disclosure may be possible

Description: fetchmail is updated to version 6.3.8 to address a cryptographic weakness that could lead to the disclosure of fetchmail passwords. Further information is available via the fetchmail web site at http://fetchmail.berlios.de/fetchmail-SA-2007-01.txt

- **file**

  CVE-ID: CVE-2007-1536

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Running the file command on a maliciously crafted file may lead to an unexpected application termination or arbitrary code execution

  Description: A heap buffer overflow vulnerability exists in the file command line tool, which may lead to an unexpected application termination or arbitrary code execution. This update addresses by performing additional validation of files that are passed to the file command.

- **iChat**

  CVE-ID: CVE-2007-2390

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  A remote attacker may be able to cause a denial of service or arbitrary code execution

  Description: A buffer overflow vulnerability exists in the UPnP IGD (Internet Gateway Device Standardized Device Control Protocol) code used to create Port Mappings on home NAT gateways in iChat. By sending a maliciously crafted packet, a remote attacker can trigger the overflow which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation when processing UPnP protocol packets in iChat.

- **mDNSResponder**

  CVE-ID: CVE-2007-2386

  Available for: Mac OS X v10.4.9, Mac OS X Server v10.4.9

  A remote attacker may be able to cause a denial of service or arbitrary code execution

  Description: A buffer overflow vulnerability exists in the UPnP IGD (Internet Gateway Device Standardized Device Control Protocol) code used to create Port Mappings on home NAT gateways in the OS X mDNSResponder implementation. By sending a maliciously crafted packet, a remote attacker can trigger the overflow which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation when processing UPnP protocol packets. This issue does not affect systems prior to Mac OS X v10.4. Credit to Michael Lynn of Juniper Networks for reporting this issue.

- **PPP**

  CVE-ID: CVE-2007-0752

  Available for: Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A local user may obtain system privileges

  Description: An implementation issue exists in the PPP daemon when loading plugins via the command line, which allows a local user to obtain system privileges. This update addresses the issue through validation of user privileges. This issue does not affect systems prior to Mac OS X v10.4. Credit to an anonymous researcher working with the iDefense VCP for reporting this issue.

- **ruby**

  CVE-ID: CVE-2006-5467, CVE-2006-6303

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: Denial of service vulnerabilities in the Ruby CGI library

  Description: Multiple denial of service issues exist in the Ruby CGI library. By sending maliciously crafted HTTP requests to a web application using cgi.rb, an attacker could trigger an issue which may lead to a denial of service. This update addresses the issues by applying the Ruby patches.

- **screen**

CVE-ID: CVE-2006-4573

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

Impact: Multiple denial of service vulnerabilities in GNU Screen

Description: The screen command line tool is updated to address multiple denial of service vulnerabilities. Further information is available via the GNU web site at http://lists.gnu.org/archive/html/screen-users/2006-10/msg00028.html

- **texinfo**

  CVE-ID: CVE-2005-3011

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A vulnerability in texinfo may allow arbitrary files to be overwritten

  Description: A file handling issue exists in texinfo, which may allow a local user to create or overwrite files with the privileges of the user running texinfo. This update addresses the issue through improved handling of temporary files.

- **VPN**

  CVE-ID: CVE-2007-0753

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9,Mac OS X v10.4.9, Mac OS X Server v10.4.9

  Impact: A local user may obtain system privileges

  Description: A format string vulnerability exists in vpnd. By running the vpnd command with maliciously crafted arguments, a local user can trigger the vulnerability which may lead to arbitrary code execution with system privileges. This update addresses the issue by performing additional validation of the arguments passed to vpnd. Credit to Chris Anley of NGSSoftware for reporting this issue.

Note: Security Update 2007-005 v1.1 was released to remove a configuration file that prevented the BIND service from automatically starting after applying the security update. The BIND service is not enabled on default configurations, and is mainly used with a Server system. For systems using BIND which applied Security Update 2007-005, manually re-enabling the BIND service will correct the issue. Security Update 2007-005 v1.1 made no changes to the security content of Security Update 2007-005. Systems that have applied Security Update 2007-005 do not need to apply Security Update 2007-005 v1.1.

About the Mac OS X 10.4.10 Server Update for PowerPC (delta)

This article has been archived and is no longer updated by Apple.

The Mac OS X Server 10.4.10 (PowerPC) Update (delta) updates Mac OS X Server 10.4.9 (PowerPC) to version 10.4.10 on PowerPC-based Macs. (If you are updating from a previous version of Mac OS X Server 10.4.x (PowerPC) to 10.4.10 see this article.)

Important: Please read before installing

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- It is recommended that you backup your system prior to installing any updates.
- If issues occur during installation--for example, Software Update quits unexpectedly--please see this article.

Installation

To update your Mac to Mac OS X Server 10.4.10, use Software Update or the standalone installer. You only need to use one of these methods to update your computer.

Software Update

Software Update, located in the Apple menu, will automatically check for the latest Apple software using the Internet. (Software Update might have linked you to this article to learn more about the update.) If your computer is not up to date, software updates for your computer will appear that you can install. Note that an update's size may vary from computer to computer when installed using Software Update. Also, some updates must be installed prior to others, so you should run Software Update more than once to make sure you have all available updates.

Standalone installer

Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. Two versions of the standalone installer are available from Apple Downloads: a delta and combo.

- The delta update for PowerPC (described in the article you're reading) updates Mac OS X Server 10.4.9 (PowerPC) to 10.4.10.
- The combo update installer (described in this article) updates Mac OS X Server (PowerPC) 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, 10.4.7, 10.4.8, or 10.4.9 to 10.4.10.

What's included?

The following modifications are included in this update:

Third-party

- Adds RAW image decoding support for the following cameras: Panasonic DMC-LX1, Panasonic DMC-LX2, Leica M8, Leica D-LUX 2, Leica D-LUX 3, Fuji S5 Pro, Nikon D40x, and Canon EOS 1D Mk III.
- Resolves an issue in which some DNG images may appear tinted or distorted.
- Improves compatibility of Mathematica 6 with 64-bit Macs.

Bluetooth

- Addresses an issue in which a Bluetooth headset may show up as an available device for sound output in the Sound preference pane after it had been removed from Bluetooth preferences.

USB

- Improves reliability when using the IR remote control after waking from sleep.
- Improves reliability when mounting external USB hard drives

Other

- Improves responsiveness when using the Control-Eject key combination to display a shutdown dialog.
- Addresses a specific issue in which users importing video from a DV camera may experience dropped frames
- Includes recent Apple security updates.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Oct 10, 2016

About the Mac OS X Server 10.4.10 Update for PowerPC (combo)

This article has been archived and is no longer updated by Apple.

The Mac OS X Server 10.4.10 (PowerPC) Update (combo) updates any version of Mac OS X Server 10.4.x (PowerPC) to version 10.4.10 on PowerPC-based Macs. (If you are updating from Mac OS X Server 10.4.9 (PowerPC) to 10.4.10 see this article.)

Important: Please read before installing

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- It is recommended that you backup your system prior to installing any updates.
- If issues occur during installation--for example, Software Update quits unexpectedly--please see this article.

Installation

To update your Mac to Mac OS X Server 10.4.10 (PowerPC), use Software Update or the standalone installer. You only need to use one of these methods to update your computer.

Software Update

Software Update, located in the Apple menu, will automatically check for the latest Apple software using the Internet. (Software Update might have linked you to this article to learn more about the update.) If your computer is not up to date, software updates for your computer will appear that you can install. Note that an update's size may vary from computer to computer when installed using Software Update. Also, some updates must be installed prior to others, so you should run Software Update more than once to make sure you have all available updates.

Standalone installer

Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. Two versions of the standalone installer are available from Apple Downloads: a delta and combo.

- The combo update for PowerPC installer (described in the article you're reading) updates Mac OS X Server (PowerPC) 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, 10.4.7, 10.4.8 or 10.4.9 to 10.4.10.
- The delta update installer (described in this article) updates Mac OS X Server 10.4.9 (PowerPC) to 10.4.10.

What's included?

For a list, see About the Mac OS X Server 10.4.10 (PowerPC) Update (delta).

This update delivers many improvements. Because this is a combo update, it includes fixes delivered with the Mac OS X Server 10.4.10 (PowerPC) Update (delta) as well as these previous Mac OS X Server 10.4.x updates: 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, 10.4.7, 10.4.8 (PowerPC) and 10.4.9 (PowerPC).

Published Date: Oct 10, 2016

About the Mac OS X Server 10.4.10 Universal Update (combo)

This article has been archived and is no longer updated by Apple.

The Mac OS X Server 10.4.10 (Universal) Update (combo) updates any version of Mac OS X Server 10.4.x (Universal) to version 10.4.10 on PowerPC-based and Intel-based Macs.

Note: There is no delta update for Mac OS X Server 10.4.10 (Universal).

Important: Please read before installing

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- It is recommended that you backup your system prior to installing any updates.
- If issues occur during installation--for example, Software Update quits unexpectedly--please see this article.

Installation

To update your Mac to Mac OS X Server 10.4.10 (Universal), use Software Update or the standalone installer. You only need to use one of these methods to update your computer.

Software Update

Software Update, located in the Apple menu, will automatically check for the latest Apple software using the Internet. (Software Update might have linked you to this article to learn more about the update.) If your computer is not up to date, software updates for your computer will appear that you can install. Note that an update's size may vary from computer to computer when installed using Software Update. Also, some updates must be installed prior to others, so you should run Software Update more than once to make sure you have all available updates.

Standalone installer

Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. One version of the standalone installer for Mac OS X Server 10.4.10 (Universal) Update is available from Apple Downloads: there is no delta for Mac OS X Server 10.4.10 (Universal) update installer.

- The combo Universal update installer (described in the article you're reading) updates Mac OS X Server (Universal) 10.4.7, 10.4.8 or 10.4.9 to 10.4.10.

What's included?

This update delivers several improvements, including:

Third-party

- Adds RAW image decoding support for the following cameras: Panasonic DMC-LX1, Panasonic DMC-LX2, Leica M8, Leica D-LUX 2, Leica D-LUX 3, Fuji S5 Pro, Nikon D40x, and Canon EOS 1D Mk III.
- Resolves an issue in which some DNG images may appear tinted or distorted.
- Improves compatibility of Mathematica 6 with 64-bit Macs.

Bluetooth

- Addresses an issue in which a Bluetooth headset may show up as an available device for sound output in the Sound preference pane after it had been removed from Bluetooth preferences.

USB

- Improves reliability when using the IR remote control after waking from sleep.
- Improves reliability when mounting external USB hard drives.
- Resolves an issue in which a TomTom GO 910 may not be recognized when connected via USB to an Intel-based Mac.

Other

- Improves responsiveness when using the Control-Eject key combination to display a shutdown dialog.
- Addresses a specific issue in which users importing video from a DV camera may experience dropped frames
- Includes recent Apple security updates.

Because this is a combo update, it also includes fixes delivered with the Mac OS X Server 10.4.9 (Universal) update as well as the previous Mac OS X Server 10.4.8 (Universal) Update.

Power Macintosh G3 All-in-one: APU v1.2 Incompatible

Apple Printer Utility v1.2 is not compatible with the Power Macintosh G3 All-in-one.
This article has been archived and is no longer updated by Apple.
Though the utility may launch and allow you to inspect or change your printers' configuration, upon quitting Apple Printer Utility, it will crash, then will likely hang your Power Macintosh G3 shortly thereafter.

Apple recommend you upgrade and use the latest version of the Apple Printer Utility, v2.2, posted on Apple Software Updates both as a standalone and accompanying LaserWriter 8.5.1.

Note: Apple Printer Utility v1.2 was shipped with LaserWriter 4/600 PS and with LaserWriter 8.2.2.

This article can help you locate the software update mentioned here:

Motion 3: Content includes new Fire Burst.mov

This article has been archived and is no longer updated by Apple.

Issue

Motion 3 includes a new version of the content asset named **Fire Burst.mov**. If you created a project in a previous version of Motion that included Fire Burst.mov, you may notice that the asset has changed. The asset that was named Fire Burst.mov in Motion 2 is now called **Fire Burst 2.mov** in Motion 3.

Solution

If you created a project in Motion 2 using the Fire Burst.mov asset, you can restore the original appearance by simply replacing Fire Burst.mov in your project in Motion 3, with the new Fire Burst 2.mov asset.

Xserve G5: Locked enclosure may prevent proper startup

This article has been archived and is no longer updated by Apple.

Issue or symptom

If the Xserve is locked at startup, it may not boot properly or appear on the network.

Solution

To resolve the issue, set the startup disk in System Preferences appropriately:

1. Unlock the computer and allow it to start up.
2. Temporarily disconnect any devices other than the keyboard and mouse that are connected to the USB or FireWire ports.
3. Disconnect any external speakers.
4. If there is a disc in the optical drive, eject it.
5. In the Startup Disk pane of System Preferences, set the startup disk as appropriate or use the `systemsetup` command.

Additional information

Under typical conditions, fans may create a slight hum that varies based on the rotational speed and the amount of air the fans move. Also, the normal operation of the hard drive and optical disc drive may generate whirring and scratching sounds that may be audible to a user. Some customers may be able to hear a faint buzzing or humming noise when their display brightness is adjusted below full brightness. These sounds do not indicate an issue.

Final Cut Pro: FxPlug - Working with high RGB values in High-Precision YUV

This article has been archived and is no longer updated by Apple.

Issue

Many FxPlug filters in Final Cut Pro and Motion are able to generate very high RGB values, even extending beyond the gamut of traditional video. When these values are converted from their native RBG color space to the YUV color space in a High-Precision YUV sequence, the results will be mathematically accurate, but due to differences in the available values between these color spaces, it's possible for the result to appear differently than intended.

In some cases this may result in bright, saturated colors in the highlight areas of the rendered result.

Solution

The **RGB Limit** filter can be used accommodate this color space difference. In this context, the following steps demonstrate how to apply the RGB Limit filter to a clip to achieve the desired result:

1. Double-click the clip in the Timeline so that it appears in the Viewer.
2. Choose **Effects > Video Filters > Color Correction > RGB Limit**.
3. In the Viewer's Filter tab, make the following settings in the RGB Limit filter:
    - Select the **Minimum RGB Limiting** check box.
    - Set the **Clamp Levels Below** parameter to **0%**.
    - Select the **Maximum RGB Limiting** check box.
    - Set the **Clamp Levels Above** parameter to **100%**.
    - Deselect the **Max RGB Reduction** check box.

Mac OS: Empty White Box On Screen

While using your Macintosh, an empty white dialog box with a ">" sign in the upper left-hand corner may appear. The box looks like an error message box, but there is no error message in it. This article describes the phenomenon and tells what to do when the box appears.
This article has been archived and is no longer updated by Apple.
The white box is the debugger window. It is also called the programmer's window. Certain buttons on old computers or key combinations on newer computers (all Power PC-based computers, for example) generate a special signal to the computer. This signal is called a "Non-Maskable Interrupt" or NMI. (An interrupt is a hardware signal that tells the computer to stop what it is doing and devote its attention to a more important task.)

Note: Typing "g" or "g Finder" will dismiss the empty box if it was entered on purpose.

The default key combination which causes the box to appear is "Command-Power". The power key is the key in the upper right hand corner of an Apple Extended Keyboard or an Apple Design Keyboard. It is also called the Reset key. This key has an icon that looks like a triangle pointing to the left. The switch is also called the debugger switch, the interrupt switch or the programmer's switch.

Also, if the Command key or Power key is stuck (or the computer thinks it is stuck), typing the other of the two keys may cause this to appear. Use Key Caps to see if a key is stuck down.

Note: The Power key may not actually turn the computer on.

If you have a debugger installed (such as Apple Computer's MacsBug), you may get a more elaborate screen with low-level information about how the computer's memory is being used. This information is useful only to someone with a knowledge of assembly language programming and Mac OS Memory Management.

To exit MacsBug, try the following steps:

1. Type "g" and Return. If MacsBug was entered on purpose, either by the user or some debugging code in a program, you should be able to continue.

2. If the MacsBug screen comes right back, Type "es" and return. This is roughly equivalent to force quitting the current application. If this works, save your work in your open applications and restart the computer.

3. If the above steps fail, you can type "rs" or "rb" to restart your computer. All unsaved work is lost.

4. If none of the above options work, press Command-Control-Power or toggle the power switch to restart your computer. All unsaved work is lost.

Once the computer is no longer in MacsBug, you may remove it from the System Folder by dragging MacsBug out of the System Folder and restarting the computer.

Final Cut Pro: Render CAF files for Timeline playback

This article has been archived and is no longer updated by Apple.

Final Cut Studio 2 supports the preview and playback of CAF (Apple Core Audio Format) audio content.

CAF content included with Final Cut Studio 2 is compressed using the Apple Lossless codec. When you use this CAF content in Final Cut Pro, you can preview it normally in the Viewer, but it will need to be rendered in order for it to be played back in a sequence at full quality.

Note: Final Cut Pro does not support compressed audio formats for Timeline playback. This includes "lossy" formats such as AAC and .mp3, as well as the high-quality Apple Lossless codec used to encode the Final Cut Studio 2 content for Soundtrack Pro. For Timeline playback, simply render the audio first.

iTunes Store: How Complete My Album works with iTunes Plus

This article has been archived and is no longer updated by Apple.

How does Complete My Album work for iTunes Plus?

Complete My Album is offered with many iTunes Plus albums. Note that if you've purchased an AAC Protected single at 128 kbps and want the iTunes Plus version of the album, you must first upgrade your iTunes library to iTunes Plus before using Complete My Album.

This explains the Complete My Album Rules with iTunes Plus music:

Owned Tracks	Album available in iTunes Plus?	CMA Offer
AAC Protected	No	CMA to AAC Protected album (deliver remaining AAC Protected tracks)
AAC Protected	Yes	Must upgrade your iTunes library to Plus first, then see Plus rules below
Mixed	No	No CMA offer
Mixed	Yes	Must upgrade your iTunes library to Plus first, then see Plus rules below
Plus	No	No CMA offer
Plus	Yes	CMA to Plus album (deliver remaining Plus tracks)

- If the tracks you own are iTunes Plus, the Complete My Album offer will deliver the remaining iTunes Plus tracks.
- If the tracks you own are AAC Protected or a mix of both AAC Protected and iTunes Plus, you must upgrade your iTunes library to iTunes Plus first, before the album is eligible for Complete My Album.

If an AAC Protected album that contains a music video is eligible for upgrade to iTunes Plus, the audio tracks will be upgraded to iTunes Plus, but if the music video is not available in iTunes Plus, the music video will be omitted from the iTunes Plus album, as well as the Complete My Album offer. In other words, the AAC Protected album with music video may be upgraded to an iTunes Plus album without music video.

Note: The Complete My Album expiration date is based on the date the track was purchased, not when it was upgraded.

For more information about iTunes Plus, please visit the iTunes Plus FAQ.

For more information about Complete my Album, see this document.

Final Cut Studio: Third-party appearance themes may cause issues

This article has been archived and is no longer updated by Apple.

Issue

If you have installed third-party appearance modifications or other software designed to supersede the Mac OS X user interface, Final Cut Studio's window contents and other graphic elements may become corrupted or may display artifacts or distortion.

Solution

Disable or remove the third-party appearance modifications if they interfere with the display or functionality of Final Cut Studio applications.

Motion 3: Third-party Plug-in path does not appear in preferences

This article has been archived and is no longer updated by Apple.

Motion can read third-party After Effects-compatible plug-ins in addition to FxPlug plug-ins. When Motion is on a Power PC-based Mac, there is a setting in Motion preferences that allows you to point to a folder where such plug-ins are located on your disk.

Issue

If you are running Motion 3 on an Intel-based Mac, you will not see this option in preferences. This is because After Effects-compatible plug-ins are not supported on Intel-based Macs.

Solution

Many third-party plug-in developers are now supporting Apple's native FxPlug plug-in format. Contact the makers of your After Effects-compatible plug-ins to inquire if they have an updated FxPlug version.

Mac OS X Server 10.4: DNS Service does not start automatically after installing Security Update 2007-005 (v1.0)

This article has been archived and is no longer updated by Apple.

Issue or symptom

After installing Security Update 2007-005 (v1.0), the Mac OS X Server 10.4 DNS service may not start automatically when the server starts up.

Solution

As a workaround, start the DNS Service in Server Admin. You should only need to do this once--it will continue to use your previous DNS configuration and will start automatically after future restarts.

This issue does not occur with Security Update 2007-005 (v1.1) for Mac OS X Server 10.4.9.

Published Date: Feb 20, 2012

About the security content of Xserve Lights-Out Management Firmware Update 1.0

This article has been archived and is no longer updated by Apple.
This document describes the security content of Xserve Lights-Out Management Firmware Update 1.0, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Xserve Lights-Out Management Firmware Update 1.0

- **Xserve Lights-Out Management Firmware**

  CVE-ID: CVE-2007-2387

  Available for: Intel-based Xserve systems

  Impact: A remote user may be able to gain admin privileges on an Xserve system with IPMI configured in a particular manner

  Description: A security vulnerability in Apple's implementation of IPMI may allow an unprivileged ipmitool user to gain administrative privileges on an Xserve system. This update addresses the issue by requiring a password for remote usage of IPMI. This issue only affects Intel-based Xserve systems. Credit to James Wilson of LithiumCorp for reporting this issue.

Published Date: Oct 10, 2016

Apple Remote Desktop 3: Which tasks are not encrypted?

This article has been archived and is no longer updated by Apple.

Apple Remote Desktop 3 encrypts most tasks using AES 128-bit encryption. For more information on ARD's encryption, see this article.

ARD 3 does not encrypt the following tasks:

- Wake
- Share Screen
- Upgrade Client Software

You may choose to encrypt Copy Items and Install Package tasks. Encryption can be enabled globally for these features in the Admin application's preferences. Also, encryption for these tasks may be enabled or disabled before executing the task.

Enabling encryption for these tasks may increase the time required to complete a task. LAN users will see see faster speeds without encryption enabled, but WAN users may not.

When dragging and dropping files, the item will be encrypted if the administrator chose to "Encrypt all network data" before starting the Control or if the "Encrypt network data when using Copy Items" checkbox is enabled. Otherwise, than the copy will not be encrypted.

When controlling computers, you can choose to encrypt passwords and keystrokes only or all network data. This encryption is done using an SSH tunnel. If the client does not have SSH access enabled, no encryption will be used.

VNC servers do not support Remote Desktop's encryption--you will see a warning when connecting to a VNC server. However, if you're using an SSH tunnel to connect, the keystrokes will be encrypted; if you're using SSH and the "Encrypt all network data" option when controlling, all network data will be encrypted.

Mac OS X Server 10.4: Entering Japanese user names in Workgroup Manager

This article has been archived and is no longer updated by Apple.

If you are using Japanese as the primary language on your server, use the following steps to create a new user with a Japanese name in Workgroup Manager.

1. Click the Accounts button
2. Click the New User button
3. Input user's name into the Name field this way:
    - Type the user's last name first (if user's full name is "山田花子", input "山田")
    - Press the Space bar
    - Type the user's first name (if user's full name is "山田花子", input "花子")
4. Input a password and set others, then click Save

In the above example, "山田　花子" should appear in the Name field. In the Info panel, "山田" appears in the left side ("Last") field and "花子" appears in the right side ("First") field of the Name line.

iSync: Putting a Mac to sleep when synching with the Motorola KRZR

This article has been archived and is no longer updated by Apple.

Issue or symptom

When synching a Motorola KRZR phone with iSync, if the computer is put to sleep during a sync session (or the phone is moved outside of Bluetooth range) an alert message may appear that says:

"There was an error pushing some changes to the phone. The synchronization may have been cancelled on the phone."

On later, subsequent syncs (after this has occurred once already) a different alert message may appear which states that the connection to the phone "failed," and, that you may need to make sure the phone is powered on.

Solution

Avoid putting your Mac to sleep when synching data with a Motorola KRAZR phone.

If you have experienced this issue and continue to receive alert messages when you sync with a Motorola KRZR, follow the manufacturer's instructions for performing a master reset of the phone.

Error -3234 when trying to update or restore iPod or connecting to the iTunes Store

This article has been archived and is no longer updated by Apple.

Issue or symptom

When trying to update or restore an iPod or connecting to the iTunes Store, you may see the following error message: "An unknown error occurred (-3234), make sure Internet connection is active."

Solution

Check to see if you got a security pack with your Internet connection software, if so use these steps to try removing the parental control:

1. Right-click the TDC-securitypack icon in the Notifcation area (System tray) and choose **TDC securitypack** from the shortcut menu.
2. If the "TDC parental control-guide" has not yet been used, run through that first. When this is done, login as an administrator in the TDC parental control.
3. Click "Installation and update."
4. Select the products to install and then deselect the box "TDC parental control."
5. Click Apply Now.
6. Restart computer and the parental control will be removed.

Now try to update or restore the iPod or connect to the iTunes Store.

Final Cut Pro 6.0.1: HD ProRes 422 capture requires Mac Pro or Power Mac G5 Quad 2.5 Ghz

This article has been archived and is no longer updated by Apple.

Capturing HD resolution video using the ProRes 422 format requires a Mac Pro with Intel Xeon processors or a Power Mac G5 Quad 2.5 Ghz, and a qualified third-party capture card.

Other Mac systems may drop frames when capturing High Definition video in the ProRes 422 format.

For more information about Apple ProRes 422 and devices qualified for use with Final Cut Studio 2, see the following resources:

- Final Cut Studio 2 System Requirements
- Final Cut Studio Partners
- Qualified Devices Guide

Mac OS X Server 10.4, 10.5: Pointing non-managed clients to a specific Software Update server

This article has been archived and is no longer updated by Apple.

If you are not using Client Management, you can use one of the following Terminal commands to point non-managed client computers to a particular Software Update server. These commands must be run by an admin user.

To change the setting for all users on the workstation:

```
defaults write /Library/Preferences/com.apple.SoftwareUpdate CatalogURL [URL]
```

To undo the change and point all users back to the Apple Software Update server:

```
defaults delete /Library/Preferences/com.apple.SoftwareUpdate CatalogURL
```

Note: Replace "`[URL]`" with the URL of the Software Update server, including the port number and the name of catalog file (index.sucatalog). For example, `http://su.domain_name.com:8088/index.sucatalog`

Motion: About memory cache and performance

This article has been archived and is no longer updated by Apple.

Background

Motion's caching will utilize your computer's RAM, taking as much memory as defined in the Project Cache preference.

To view or change this setting in Motion, do the following:

1. Choose **Motion > Preferences**.
2. Click **Cache** in the toolbar to reveal the Cache pane.

The Project Cache setting represents the percentage of your computer's total memory that you wish to use. The larger the number, the more memory will be available to Motion to cache frames, resulting in a higher likelihood of consistently smooth playback.

The Project Cache setting is retained as global to Motion; when you close a project, the memory is still reserved while Motion is running. This memory reservation may affect the performance of other applications that are running at the same time as Motion.

Considerations

Depending on your work style, there are a number of approaches to balancing the memory requirements of Motion and other applications that you run.

- If you run many applications simultaneously, try a lower Project Cache setting, so that memory will be available for other applications as well as Motion.
- If you prefer a high Project Cache setting for increased performance while using Motion, you can quit Motion when you are finished, so that the reserved memory will become available to other applications.
- Adding more physical RAM to your computer is another way to allow Motion to have a relatively large memory reservation, with a lower Project Cache percentage setting. This allows a proportionately larger amount of memory to be used by other applications.

MacBook Pro display issue related to "hot-plugging"

This article has been archived and is no longer updated by Apple.

Issue or symptom

When hot-plugging an external display into your MacBook Pro, you may notice the external display occasionally stays dark, or the internal display of the MacBook Pro appears to flash or turn black.

Sometimes, when switching from an S-Video to a DVI connection, the internal display may appear black or display only the mouse cursor.

Solution

1. Wait 5 seconds for the screen to automatically re-size or activate.
2. If this doesn't occur after 5 seconds, click on **Detect Displays** in the Displays pane of System Preferences.
3. If the internal (or external) display still doesn't re-size or activate, press the F7 key to turn on mirroring mode, or restart the computer.

This document will be updated as more information becomes available.

MacBook Pro (2.4/2.2GHz): Icons for video clips recorded with built-in iSight camera appear dark in iMovie

This article has been archived and is no longer updated by Apple.

Issue or symptom

On MacBook Pro (2.4/2.2GHz) computers, the icons for video clips in iMovie sometimes appear dark in the Clips pane when they are recorded with the built-in iSight camera.

The first time you use your built-in iSight camera, the camera may need to calibrate itself. As a result, the first few frames recorded by the camera may appear dark.

Solution

If you have footage recorded when using your camera for the first time, use iMovie to remove the first few frames that were used to create the icon, or try recording the footage again.

Mac OS X: Clearing the Finder "Open With" contextual menu

This article has been archived and is no longer updated by Apple.

Ever wondered how to "clear" the Finder's Open With... contextual menu choices of any extraneous or older applications? (This is the menu that appears when you control-click or "right-click" a document icon.)

If your Open With... menu is filled with too many choices to easily scroll through, you can remove the less-commonly used choices. These steps will clear the list except for the most current applications that can open your document.

1. From the Finder **Go** menu, choose **Home**.
2. Open the Library folder in the Home window.
3. Open the Preferences folder.
4. Find com.apple.LaunchServices.plist.
5. Rename "com.apple.LaunchServices", such as to "com.apple.LaunchServices.old", or move it to the Trash.

The next time you use the Open With.... contextual menu in the Finder, only current applications will be listed. Some items may return if the application that controls them adds itself back to the list.

About the security content of Apple TV 1.1

This article has been archived and is no longer updated by Apple.

This document describes the security content of Apple TV 1.1.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Apple TV 1.1

- **Apple TV**

  CVE-ID: CVE-2007-2386

  Available for: Apple TV

  Impact: A remote attacker may be able to cause a denial of service or arbitrary code execution

  Description: A buffer overflow vulnerability exists in the UPnP IGD (Internet Gateway Device Standardized Device Control Protocol) code used to create Port Mappings on home NAT gateways in the Apple TV implementation. By sending a maliciously crafted packet, a remote attacker can trigger the overflow which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation when processing UPnP protocol packets. Credit to Michael Lynn of Juniper Networks for reporting this issue.

Installation note:

This update is only available directly to the Apple TV, and will not appear in your computer's Software Update application, or in the Apple Downloads site.

The Apple TV device will automatically check Apple's update server on its weekly schedule. When an update is detected, it will download it and present the user with the option to install the update immediately or later. We recommend applying the update immediately if possible. Selecting "later" will present the option about a week later when the device once again checks for available updates.

The automatic update process may take up to a week depending on the day that the Apple TV device checks for updates. Alternatively, you may manually update your Apple TV using the TV interface by selecting Settings > Update Software.

To check that the Apple TV has been updated, use the TV interface:

- Navigate to Settings
- Select About
- The Software Version after applying this update will be "1.1"
- To exit the About screen to the main menu, press Menu

Avoiding radio frequency interference

This article has been archived and is no longer updated by Apple.

Nearly every electronic device is subject to radio frequency (RF) interference from external sources if inadequately shielded, designed, or otherwise configured to be compatible. As a result, iPhone may cause interference with other devices. Follow these instructions to avoid interference problems.

- **Aircraft**
  Federal Aviation Administration (FAA) regulations may prohibit using wireless devices while in the air. For more information about using Airplane mode to turn off the iPhone wireless transmitters, see the iPhone User's Guide.
- **Vehicles**
  Radio frequency signals may affect installed or inadequately shielded electronic systems in motor vehicles. Check with the manufacturer or its representative regarding your vehicle.
- **Electronics Devices**
  Most modern electronic equipment is shielded from RF signals. However, certain electronic equipment may not be shielded against the RF signals from the iPhone.
- **Pacemakers**
  The Health Industry Manufacturers Association recommends that a minimum separation of 6 inches (15 cm) be maintained between a handheld wireless phone and a pacemaker to avoid potential interference with the pacemaker. Persons with pacemakers:
    - Should always keep iPhone more than six inches from their pacemaker when the phone is turned on
    - Should not carry iPhone in a breast pocket
    - Should use the ear opposite the pacemaker to minimize the potential for interference

  If you have any reason to suspect that interference is taking place, turn iPhone off immediately.

- **Hearing Aids**
  The iPhone may interfere with some hearing aids. If it does, consult the hearing aid manufacturer or your physician for alternatives or remedies.
- **Other Medical Devices**
  If you use any other personal medical device, consult the manufacturer of your device or your physician to determine if it is adequately shielded from external RF energy.

  Turn the iPhone off in health care facilities when any regulations posted in these areas instruct you to do so. Hospitals and health care facilities may use equipment that is sensitive to external RF energy.
- **Posted Facilities**
  Turn off the iPhone in any facility where posted notices so require.
- **Blasting Areas**
  To avoid interfering with blasting operations, turn off iPhone when in a "blasting area" or in areas posted "Turn off two-way radio." Obey all signs and instructions.

FCC Compliance Statement

This device complies with part 15 of the FCC rules. Operation is subject to the following two conditions:

1. This device may not cause harmful interference, and
2. this device must accept any interference received, including interference that may cause undesired operation.

Important: Changes or modifications to this product not authorized by Apple could void the EMC compliance and negate your authority to operate the product. This product has demonstrated EMC compliance under conditions that included the use of compliant peripheral devices and shielded cables between system components. It is important that you use compliant peripheral devices and shielded cables between system components to reduce the possibility of causing interference to radios, televisions, and other electronic devices.

AppleVision 1.6.1: Read Me

This article comprises the Read Me for AppleVision software version: 1.6.1. This software was released by Apple on June 16, 1998 and is available for downloading from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Description:
If you are using the Apple Studio Display, AppleVision 750AV or AppleVision 1710AV connected to a PowerBook G3 Series with Apple Displays Software 1.6 software installed, you may get an error message that reads, "AppleVision failed to load completely." when you wake up your computer. Version 1.6.1 of the "AppleVision" extension significantly reduces the frequency of the error message occurring.

IMPORTANT: Apple Displays Software 1.6 includes the extension "AppleVision" 1.6. Please refer to the documentation included with this software for complete details.

Editor's Note: A newer version of this software, version 1.7.1, has been released. Refer to Knowledge Base article 58278: "**Apple Displays Software 1.7.1 Read Me**"

This article has been archived and is no longer updated by Apple.
Information about AppleVision 1.6.1

Who should install this software?

Customers using Apple Displays Software 1.6 on a PowerBook G3 Series connected to one of the following displays:

- Apple Studio Display
- AppleVision 750AV
- AppleVision 1710AV

This software was tested with the U.S. English versions of Mac OS 7.5 through Mac OS 8.1.

IMPORTANT: Apple Displays Software 1.6 includes the extension "°AppleVision" 1.6.

Why is this software needed?
If you are using the Apple Studio Display, AppleVision 750AV or AppleVision 1710AV connected to a PowerBook G3 Series with Apple Displays Software 1.6 software installed, you may get an error message that reads, "AppleVision failed to load completely." when you wake up your computer. Version 1.6.1 of the "°AppleVision" extension significantly reduces the frequency of the error message occurring.

Installation instructions
Drag the extension named "°AppleVision" to your System folder. It will be automatically routed to the Extensions folder. Restart your computer.

AppleShare IP: Setting up the Mail Server to Send and Receive Through Dialup

I have a dialup connection to the Internet, and want to set up my AppleShare IP mail server to dial up several times a day, send any outgoing mail, and pick up any incoming mail. Is this possible? How would I set it up?
This article has been archived and is no longer updated by Apple.
Yes, you can set up ASIP mail server to send/receive mail several times a day. In brief, you can make arrangements that all outgoing mail be relayed to your ISP's mail server for delivery to its ultimate location, and that any incoming mail be delivered to your ISP's mail server until you are online and it can be delivered to you.

Important: In this scenario, you will want the ASIP mail server to have connectivity to two separate IP network segments:

- Your local area network, so that users can exchange mail with the ASIP Mail server
- Your PPP connection, so that the mail server can exchange mail with other mail servers on the Internet.

To do this, you will need some type of router or gateway, such as Vicom Internet Gateway. This allows the server to connect via a PPP connection, yet maintain a connection (by mirroring a port), to your private IP network. Without such a router or gateway, your users will not be able to send/receive mail from the server if it is set to use the PPP port for all TCP/IP connections.

Setting up ETRN to retrieve mail from your Internet Service Provider
ETRN (extended turn) command uses a mechanism to define extensions to the SMTP service whereby a client may request that the server start the processing of its mail queues for messages that are waiting at the server for the client machine. If any messages are at the server for the client, then the server should create a new SMTP session and send the messages at that time.

1. Verify with your ISP that they can support ETRN requests.
2. Ask your ISP to set up a "backup" mail server for your domain name, example: "acme.com". They will need to modify the MX-List for "acme.com", to list their own mail server as a mail exchanger for acme.com.
3. Ask the ISP for the name of the mail server they have specified as a backup for your mail server (For the purposes of this example we will call that mail server "mail.myisp.com".)
4. Open ASIP Mail Admin and start the Mail Server program.
5. After both are up and running, open the host list window in Mail Admin.
6. Choose "Show Host List" from the Server menu.
7. Click the Create New Host button in the host list window.
8. When the "name" dialog box opens, enter the name of your ISP's mail server --"mail.myisp.com".
9. When this entry shows up in the list, select it and click the Edit Host button in the Host List window.
10. In the Edit Hosts Window for the ISP mail server, click the Schedule Tab.
11. Choose Set Allowed Connection Times from the pop-up menu.
12. Set up a schedule of allowed connection times on the 7-day, 24-hour panel. Green means allowed to connect at that time, gray means do not connect at that time.
13. Click the Remote Mail Polling (ETRN) checkbox in the lower right hand corner. This will allow the ASIP 6.0 Mail Server to poll your ISP's mail server during allowed connection times and ask it to download any mail waiting for your domain name.

Forwarding all your remote mail through one SMTP mail server.
When running with a dialup connection, it is sometimes useful to have all your outgoing mail sent to one SMTP mail server so that your AppleShare IP mail server doesn't waste time sending mail to various mail servers all over the Internet (which may be down or unreachable at the time your server is connected). Forwarding all your mail to another SMTP mail server with a timed Internet connection is a method of off-loading mail delivery to another server that has the bandwidth and the time to complete the message delivery process.

1. Open Mail Admin with the ASIP Mail Server running
2. Choose Mail Server Settings from the Server menu.
3. Click the Mail Out Tab.
4. Click the Relay all SMTP mail via checkbox
5. In the text field next to the check box enter the name of your ISP's mail server.
6. Click Save and close the window.

All outgoing mail will now be forwarded to the designated SMTP mail server to complete the delivery process. Setting this option has no effect on mail that is being delivered to your local users, it will only affect mail that has to be delivered to other mail servers.

Set Up the AppleShare IP Mail Server
Set Up the AppleShare IP Mail Server with its name for aliases or private IP networks (such as with the Vicom Gateway or other PPP dialup IP

gateways).

1. Open Mail Admin with the ASIP Mail Server running
2. Determine the domain name(s) that your ISP has registered for your company or mail server. These are the name(s) other people will use to send you mail.
3. Open the Host List window in Mail Admin.
4. Click the New Host button in the Host List window.
5. Enter the domain name of your mail server.
6. Select the host you just created when it appears in the list.
7. Click the Edit Host button.
8. Click the mail-out tab.
9. Click the Relay all SMTP mail via checkbox.
10. Enter the private-IP address of your ASIP mail server in the text box.
11. Click Save.
12. Repeat starting at step 4 for each additional name you want your mail server to know about.

Setup a default schedule for all outgoing mail

1. Open Mail Admin with the ASIP Mail Server running.
2. Open the Host List window in Mail Admin.
3. Choose Edit Default Host Profile from the Server menu.
4. Click each of the four tabs Mail In, Mail Out, Schedule, and Network.
5. Make sure all settings are the way you want them for all outgoing mail. In particular, make sure to set up the schedule that you want mail to be sent with.
6. Click Save.

Note: Do NOT click the Remote Mail Polling feature for Default hosts, you only need to enable this feature for a single host, not all of them.

Now any time your users send mail to any other Internet mail server, the outgoing mail will wait until an allowed connection time to be sent. Using this in combination with the global server setting to relay all outgoing mail via one server is a powerful combination. ASIP mail server holds all your outgoing mail until an allowed connection time, and then all the mail is sent to one SMTP server at once.

About the security content of the Mac OS X 10.4.10 Update

This article has been archived and is no longer updated by Apple.

This document describes the security content of the Mac OS X 10.4.10 Update, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

- **Networking**

  CVE-ID: CVE-2007-2242

  Available for: Mac OS X v10.4 through Mac OS X v10.4.9, Mac OS X Server v10.4 through Mac OS X Server v10.4.9

  Impact: Remote attackers may be able to adversely affect network performance

  Description: A design issue exists in the IPv6 protocol's handling of type 0 routing headers. Depending on network topology and capacity, the reception of specially crafted IPv6 packets may lead to a reduction in network bandwidth. This update addresses the issue by disabling the support for type 0 routing headers. This issue does not affect systems prior to Mac OS X v10.4.

Using Access Control Lists to restrict access to an AirPort Extreme (802.11n) base station

This article has been archived and is no longer updated by Apple.

With AirPort Utility and Mac OS X, you can use an Access Control List (ACL) to restrict access to your AirPort base station network to specific computers that you specify. You can export an Access Control list as a text file with AirPort Admin Utility, then use AirPort Utility to upload the list to a new AirPort Extreme (802.11n) base station.

To import an existing Access Control list:

1. Open AirPort Utility in Mac OS X and select the base station you will be sending the list to.
2. Configure the base station manually by choosing **Manual Setup** from the **Base Station** menu or by pressing Command-L.
3. Option-click the **File** menu and choose "Import Access Controls".
4. Navigate to your saved Access Control list.

Soundtrack Pro 2: No audio output when using FireWire for video output

This article has been archived and is no longer updated by Apple.

Issue or symptom

In some situtations, there may be no audio when outputting video to a FireWire device from Soundtrack Pro 2.

Solution

This can occur when using a stereo submix setting in the Multitrack Editor. Change the submix setting to surround 1-6 as a workaround.

This document will be updated as more information becomes available.

iMac: Open Firmware and Exiting to Mac OS

This article describes what has happened, and what to do, when the following white screen appears on an iMac that is starting up:

```
Apple iMac Open Firmware X.XX built on XX/XX/98 at XX:XX:XX
Copyright 1994-1998 Apple Computer, Inc.
All Rights Reserved.
ok
0)
```

This article has been archived and is no longer updated by Apple.

This screen is the iMac Open Firmware screen. Beginning with Power Macintosh computers with PCI slots, Power Macintosh computers rely on a firmware operating system called "Open Firmware" for controlling hardware. Open Firmware is a cross-platform firmware standard for controlling hardware and is used by all PCI-based Mac OS computers. Open Firmware is used mainly by Apple hardware developers. There is very little need for iMac users to ever need to start up into Open Firmware.

Although it is fairly difficult to mistakenly start up into Open Firmware, you may accidentally start up into Open Firmware by holding down the Command-Option-O-F keys at restart or power on before any video is displayed on the screen. The iMac should never start up into Open Firmware on its own.

If you are at the Open Firmware screen and want to start up into Mac OS, simply type "`mac-boot`" without the quotes at the command prompt and press Return to exit Open Firmware. The iMac should exit Open Firmware and continue starting up into Mac OS.

Portable Home Directory: Don‘t back up certain directories or restore them from a backup

This article has been archived and is no longer updated by Apple.

Issue or symptom

Restoring a Portable Home Directory from a backup can result in data loss if certain directories are restored.

Solution

To avoid possible data loss issues after restoring a mobile account's Home from a backup, do not restore (~/Library/Mirrors).

To avoid this issue, always exclude the (~/Library/Mirrors) folder when creating a mobile account backup.

About Security Update 2007-006

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2007-006, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2007-006

- **WebCore**

  CVE-ID: CVE-2007-2401

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9 or later, Mac OS X Server v10.4.9 or later

  Impact: Visiting a malicious website may allow cross-site requests

  Description: An HTTP injection issue exists in XMLHttpRequest when serializing headers into an HTTP request. By enticing a user to visit a maliciously crafted web page, an attacker could conduct cross-site scripting attacks. This update addresses the issue by performing additional validation of header parameters. Credit to Richard Moore of Westpoint Ltd. for reporting this issue.

- **WebKit**

  CVE-ID: CVE-2007-2399

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.9 or later, Mac OS X Server v10.4.9 or later

  Impact: Visiting a maliciously crafted website may lead to an unexpected application termination or arbitrary code execution

  Description: An invalid type conversion when rendering frame sets could lead to memory corruption. Visiting a maliciously crafted web page may lead to an unexpected application termination or arbitrary code execution. Credit to Rhys Kidd of Westnet for reporting this issue.

About the Safari Beta 3.0.2 for Mac OS X

This article has been archived and is no longer updated by Apple.

The Safari Beta 3.0.2 for Mac OS X was released on June 22, 2007. This beta software is for trial purposes and intended to gather feedback prior to a full release.

Safari Beta 3.0.2 for Mac OS X addresses the following Safari issues:

- Includes the latest security updates for Safari.
- Safari might unexpectedly quit when parental control features are enabled for an account.
- Safari might unexpectedly quit when sending a news headline as an email from Google Reader.

Safari Beta 3.0.2 for Mac OS X also updates WebKit to address the following issues:

- There may be missing quoted text when replying to an email message containing HTML.
- Spaces might not appear when when typed at the beginning of a line, when replying to an email message containing HTML.
- Improves stability of Mail.
- An issue in which incoming iChat messages could be delayed.
- Improves compatibility with Dashboard widgets that make use of plug-ins.
- Improves compatibility with Dashboard widgets that have a search field.
- Addresses an issue in which BBEdit might unexpectedly quit while dragging text outside of an HTML preview window.

Important: Safari Public Beta is preview software licensed for use on a trial basis for a limited time. Do not use Safari Public Beta in a commercial operating environment or with important data. You should back up all of your data before installing this software and regularly back up data while using the software. Your rights to use Safari Public Beta are subject to acceptance of the terms of the software license agreement that accompanies the software.

Important: Apple does not provide technical phone support or fee-based support agreements for using Safari Beta 3.0. Support is available on Apple's website.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iMovie HD 6: Incorrect clip duration when capturing HDV 1080i 25 fps

This article has been archived and is no longer updated by Apple.

Issue or symptom

When capturing HDV 1080i 25 frames per second (fps), the clip duration shown in the iMovie HD project may be longer than it appeared on the camera. This may also affect iDVD projects created from this iMovie HD project.

- HDV 1080i 25 fps is commonly used in PAL regions
- HDV 1080i 30 fps is commonly used in NTSC regions

Solution

Follow these steps to work around the issue:

1. Open a new project and import the HDV 1080i 25 fps footage from the camera.
2. Once the footage is captured from the camera, close and save the project.
3. In the Finder, find the project, control-click or right-click on it then select to show package contents.
4. In the new window, open the media folder and drag the clip(s) into the media shelves of a new or existing iMovie HD 6 project.

Repeat these steps every time you import HDV 1080i 25 fps footage from a camera.

Apple Displays : Visible Diagonal Lines

I have several diagonal lines on my monitor sloping upward and to the right. What are these lines and how can I get rid of them

This article has been archived and is no longer updated by Apple.

These are retrace lines and they are normally not visible when the display is in proper alignment. If the lines cannot be removed by changing the brightness or contrast adjustments, the display will require service. An Apple-authorized service provider can repair or properly align the display for proper brightness and white balance.

PowerBook G3 Series: Backup Battery Purpose and Life

How long can the internal backup battery in my PowerBook G3 Series or PowerBook (FireWire) maintain the date and time settings?
This article has been archived and is no longer updated by Apple.
The main function of the backup battery is to maintain the contents of RAM (random-access memory) and the date and time while you swap out the main battery.

Important: This should only be done while the PowerBook is turned off or in sleep mode.

A fully charged internal backup battery allows you to leave a G3 Series PowerBook in sleep mode for approximately 4 minutes before it shuts down. This should be adequate time to remove and replace a main battery.

The original PowerBook G3 Series has the ability to use two expansion bay devices and run from the AC adapter with no main battery installed.

Note: The PowerBook G3 (Bronze keyboard)and PowerBook (FireWire) do not have this capability.

If you choose to store or transport the PowerBook without a main battery installed, a fully charged backup battery by itself maintains date and time, as well as other PRAM (parameter RAM) settings, for approximately 5 hours after shutdown.

Storing and transporting the PowerBook with a main battery installed greatly increases the amount of time that these settings are maintained in nonvolatile memory.

If you find that the computer is not holding the date and time, try resetting the Power Manager, as described in article 14449: "**PowerBook: Resetting Power Manager**".

If the date and time are not held after a shutdown, it is likely that the backup battery is either discharged or needs replacement. Follow these steps to charge the backup battery:

1. Remove the main batteries.
2. Reset the Power Manager as described in article 14449: "**PowerBook: Resetting Power Manager**".
3. Connect the AC power adapter for 4 hours to fully charge the backup battery.If discharged main batteries are installed in the computer, recharging the backup battery may take up to 48 hours to completely charge.

If the date and time are still not held after a shutdown, have the backup battery replaced by an Apple Authorized Service Provider.

For additional information on testing the internal PowerBook battery, refer to article 30017: "**PowerBook: Testing Backup Battery**"

Color 1.0 and 1.0.1: Network-based home directories are not supported

This article has been archived and is no longer updated by Apple.

Issue or symptom

Color (a part of Final Cut Studio 2) only supports home directories when they are in the default Mac OS X location, which is `/Users`. Color does not support network-based home directories.

If a home directory resides on the network or outside the default Mac OS X location (the "Users" folder), Color may not start or be fully functional.

Solution

Before installing Color, make sure you have an administrator account whose home directory resides in the default location on the local disk.

Only use Color if your Home is in the standard, default location (/Users).

Additional information

This issue is resolved in Color 1.0.2.

For more information about installing Color, refer to the document named Installing Your Software, included on the main Final Cut Studio installation disc.

This document will be updated as more information becomes available.

SerialDMA 2.1 Update: Read Me

Name: SerialDMA Update

Version: 2.1

Released: July 8, 1998

Requires:
SerialDMA 2.1 extension works with U.S. English Mac OS 7.6.1, 8.0, or 8.1, and any of the following Mac OS computers: Power Macintosh 4400, Power Macintosh 5500, Power Macintosh 6500, Twentieth Aniversary Macintosh, Power Macintosh 7220, Power Macintosh G3, PowerBook 2400, PowerBook G3, or PowerBook G3 Series.

Description:
Includes version 2.1 of the SerialDMA extension, which supplies a replacement serial driver for a specific set of Mac OS computers. This new driver fixes an incompatibility that prevents certain serial devices, such as digital cameras, from establishing an initial connection. If you are using one of the Mac OS computers listed above, and you are using a serial device which cannot establish an initial connection, you should install this update.

Instructions:
This software consists of a self-mounting Disk Copy compressed image (.smi) file. Download this software to your hard drive and then double-click it to use it. You do not need Disk Copy to access .smi files.
This article has been archived and is no longer updated by Apple.
Note: This extension is no longer needed with Mac OS 8.5 and later.

Important Information About SerialDMA Update 2.1

What is the SerialDMA Update?
Serial DMA Update 2.1 consists of version 2.1 of the SerialDMA extension, which supplies a replacement serial driver for a specific set of Mac OS computers. This new driver fixes an incompatibility that prevents certain serial devices, such as digital cameras, from establishing an initial connection.

Who Needs to Install the SerialDMA Update?
If you are using one of the following Mac OS computers listed below, and you are using a serial device which cannot establish an initial connection, you should install this update.

Power Macintosh 4400
Power Macintosh 5500
Power Macintosh 6500
Power Macintosh 7220
Power Macintosh G3
Twentieth Aniversary Macintosh

PowerBook 2400
PowerBook G3
PowerBook G3 Series

Note: The PowerBook 3400 Is not supported by this update.

Software Required:
SerialDMA 2.1 extension works with U.S. English Mac OS 7.6.1, 8.0, or 8.1.

Installing SerialDMA Update 2.1:
1. Run the installer.
2. After installing, you must reboot for the software to take effect.

Note: This article mentions an Apple software update. You may search for software updates in the Software Updates Library at following URL: "**http://asu.info apple.com**"

Remote Desktop reports Mac OS X 10.4.9 after Mac OS X 10.4.10 Update is installed

This article has been archived and is no longer updated by Apple.

Issue or symptom

Remote Desktop 3.1 may report that a computer has Mac OS X version 10.4.9 even though is has actually been updated to Mac OS X 10.4.10.

Solution

To verify which Mac OS X version is installed, check the Build information, which should be correct even if the version is not:

Mac OS X version	Build (PowerPC-based Mac)	Build (Intel-based Mac)
10.4.9 (client or server)	8P135	8P2137
10.4.10 (client)	8R218	8R2218 or 8R2232
10.4.10 (server)	8R218	8R2218b

Note: If the Mac OS X Server 10.4.10 Update (Universal) is installed on a PowerPC-based server, the Intel build number appears.

MacBook Pro: Install MacBook Pro Software Update 1.0 before EFI Firmware Update 1.3

This article has been archived and is no longer updated by Apple.

The EFI Firmware Update 1.3 resolves a display issue on MacBook Pro 2.2GHz and 2.4GHz 15-inch computers. This update is available via Software Update preferences or as a standalone installer from Apple Downloads. MacBook Pro Software Update 1.0 must be installed before installing MacBook Pro EFI Firmware Update 1.3.

System Requirements

- MacBook Pro 2.2GHz or MacBook Pro 2.4GHz
- Mac OS X 10.4.9 or later
- MacBook Pro Software Update 1.0 installed

Install MacBook Pro Software Update 1.0 before EFI Firmware Update 1.3

MacBook Pro Software Update 1.0 must be installed before installing MacBook Pro EFI Firmware Update 1.3.

If MacBook Pro Software Update 1.0 has not been installed, *MacBook Pro EFI Firmware Update 1.3 will not appear in Software Update*.

If MacBook Pro Software Update 1.0 has been installed and the MacBook Pro EFI Firmware Update 1.3 has been downloaded but has not been installed, or the installation was canceled, you can double-click "MacBook Pro EFI Firmware Update", located in (/Applications /Utilities), to run the installer again.

Power Macintosh G3: Digital Camera Issue

I have a digital camera that I'm using with my Power Macintosh G3 and I can't seem to establish an initial connection with it using the serial port.
This article has been archived and is no longer updated by Apple.
This is a known issue and is resolved with SerialDMA 2.1 Update, which consists of version 2.1 of the SerialDMA extension. This new driver fixes an incompatibility that prevents certain serial devices, such as digital cameras, from establishing an initial connection. If you are using one of the following Mac OS computers, and you are using a serial device which cannot establish an initial connection, you should install this update.

- Power Macintosh 4400
- Power Macintosh 5500
- Power Macintosh 6500
- Twentieth Anniversary Macintosh
- Power Macintosh 7220
- Power Macintosh G3
- PowerBook 2400
- PowerBook 3400
- PowerBook G3
- PowerBook G3 Series.

Motion: Tips for using gestures

This article has been archived and is no longer updated by Apple.

If you use a third-party graphics tablet and pen with your computer, you can use gestures to navigate within Motion and to perform tasks such as editing, copying and pasting, and so forth. Gestures are continuous, uninterrupted patterns that are drawn in the Motion user interface using your tablet and pen.

If Motion does not respond to gestures as expected, these tips may help resolve the issue:

- Confirm that you have installed the latest compatible drivers for your graphics tablet. Consult the manufacturer's website for the latest information about available drivers.
- Verify that Handwriting Recognition is enabled in Ink preferences (in System Preferences).
- If your Mac OS X startup volume has a name with more than 26 characters (including spaces), Motion might not respond to gestures as expected. Change the name of your Mac OS X disk so that has 26 or fewer characters (including spaces).
- If you have assigned a pen button as the trigger for gesture input method in Motion preferences, be sure that the same pen button does not have a function assigned to it by the tablet's software. For example, if you are using a Wacom tablet, and you wish to assign a pen button to invoke gesture input method in Motion, you should check the assignment for that pen button in Wacom Tablet preferences in System Preferences. Change the assignment to "Application Defined" or "Ignore" for that pen button in the Wacom Tablet pane to allow Motion to define the action for that button.

Choose **Help > Motion User Manual** in Motion for detailed information about using and configuring gestures.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Final Cut Pro 6.0.1: Incorrect AVCHD clips may be transferred

This article has been archived and is no longer updated by Apple.

Issue or symptom

Final Cut Pro 6.0.1's Log and Transfer window allows you to ingest footage from numerous disks, cards, or connected devices. For example, you can transfer footage from a connected AVCHD camcorder as well as from a SD card.

In some cases, it's possible for AVCHD footage from a different clip to appear in a logged clip after it has been ingested. This may happen if you attempt to transfer clips from more than one connected device or mounted volume at the same time.

Solution

Have only one connected device or mounted volume at a time in the Log and Transfer window. If more than one volume icon appears in the Log and Transfer window, disconnect or eject all but one.

This document will be updated as more information becomes available.

Published Date: Oct 10, 2016

Final Cut Pro 6.0.1: Working with spanned AVCHD clips

This article has been archived and is no longer updated by Apple.

A spanned AVCHD clip is a clip that consists of two or more media files. Spanned clips are created whenever you record a single shot that exceeds the file size limit of the recording device.

When this happens, the camcorder continues recording the shot to a new media file. If that file reaches the limit, the camcorder will go on to another new media file, and so on. **Note:** With spanned clips, you will not see multiple clips in your camcorder's clip browser, because the camera treats the spanned media segments as if they were a single clip.

Because AVCHD media uses an inter-frame compression method, it's necessary for the the camcorder to assess a number of frames (known as a GOP, or Group Of Pictures) in order to record or display any one given frame. When the camcorder stops recording one of a spanned clip's media files and goes on to recording another, it may record the same frames at the end of one segment, as well as at the beginning of the next. This is done so that the GOP structure of the recording can remain intact rather than being broken, ensuring smooth playback on your camcorder.

When Final Cut Pro 6 transfers spanned AVCHD clips to your computer, these extra frames are accounted, but there may be some resulting issues that you should be aware of:

- In the Log and Transfer window, you can preview AVCHD clips to review their contents, and decide whether or not you want to transfer them to your project. If you play a clip that is the second or subsequent segment of a spanned clip, there may be a brief "blink" of black video just as the playback begins. This is normal, and does not indicate a problem with the clip. This may also occur if you scrub the playhead in the preview section of the Log and Transfer window.

- After being transferred to the Browser, some of the clips from spanned clips (specifically, the second and subsequent segments) may have slightly different Media Start and Duration times than indicated in the Log and Transfer window. For example, if the Media Start time of a clip is 00:00:00:00 in the Log and Transfer window, it may appear as 00:00:00:20 or 00:00:00:24 after being transferred to the Browser. In such cases, your clips should always contain slightly more total media than indicated, as opposed to less. All of your footage will be included. The offset in these cases will be less than one second.

- Approximately one half second of audio may be silent at the tail end of all but the last clips in a spanned AVCHD clip. The audio will be present in the redundant section at the beginning of the next clip segment of that spanned clip.

- The second and subsequent clips of a spanned clip may have extra frames added at the front of each clip segment after being transferred. This allows for some overlap, so that the clips can be re-joined in the Timeline. AVCHD doesn't use traditional timecode, so the Media Start times for the spanned clip segments will all be within one second of 00:00:00:00. Because of this, you can't use the clips' timecode to join the spanned clip segments. It may require extra care to re-join the clips in the Timeline with precision.

This document will be updated as more information becomes available.

Mac OS X 10.5: Using DTrace instead of KTrace

This article has been archived and is no longer updated by Apple.

The command line-based process debugging tool KTrace, which is used for tracing kernel processes in Mac OS X 10.4 and earlier, is not included with Mac OS X 10.5 Leopard. There is no manual entry (`man`) for the command line-based process debugging tool KTrace.

Mac OS X 10.5 or later utilizes a more robust kernel tool called DTrace.

You can learn more about DTrace and its usage by opening Terminal and typing: `man dtrace`

iMovie ’08: Thumbnails won‘t update if photo is cropped

This article has been archived and is no longer updated by Apple.

Issue

If you crop a photo in iMovie ’08, the thumbnail for that photo doesn't update. For example, when you place a portrait photo into a project it displays a portrait thumbnail. If you crop that photo as a landscape, it will now display in the project as a landscape photo, but the thumbnail still shows the photo as a portrait.

Solution

This is normal. Thumbnails are designed to retain their original state.

iMovie ’08: Exporting two movies of equal size to YouTube results in one rejected as a duplicate

This article has been archived and is no longer updated by Apple.

Issue

When you export two movies of equal duration to YouTube, the second movie may be rejected by YouTube as a duplicate. This may occur even though the second movie has a different title.

Solution

To prevent your movie from being rejected as a duplicate, make a slight change to the duration of your second movie. This will help them to be differentiated by YouTube when they are uploaded.

How to use an iPhoto slideshow with iWeb 1.x

This article has been archived and is no longer updated by Apple.

You may want use an iPhoto slideshow in iWeb 1.x. Although there is no direct way to share a slideshow from iPhoto, it can be easily done by exporting the slideshow as a QuickTime movie.

1. Select the slideshow in the iPhoto Source list.
2. Choose **File > Export**.
3. Select a destination and name for the movie in the file selector dialog, and click the **Export** button.
4. After the slideshow has been saved, you can drag the exported .mov file to a page in iWeb.

If you are a .Mac member, you can create a Photos page, which automatically includes a Slideshow button. Published iWeb 1.x pages to .Mac can then be viewed as slideshows.

About the security content of QuickTime 7.2

This article has been archived and is no longer updated by Apple.

This document describes the security content of QuickTime 7.2, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

QuickTime 7.2

- **QuickTime**

  CVE-ID: CVE-2007-2295

  Available for: Mac OS X v10.3.9, Mac OS X v10.4.9 or later, Windows Vista, XP SP2

  Impact: Viewing a maliciously crafted H.264 movie may lead to an unexpected application termination or arbitrary code execution

  Description: A memory corruption issue exists in QuickTime's handling of H.264 movies. By enticing a user to access a maliciously crafted H.264 movie, an attacker can trigger the issue which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of QuickTime H.264 movies. Credit to Tom Ferris of Security-Protocols.com, and Matt Slot of Ambrosia Software, Inc. for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2007-2392

  Available for: Mac OS X v10.3.9, Mac OS X v10.4.9 or later, Windows Vista, XP SP2

  Impact: Viewing a maliciously crafted movie file may lead to an unexpected application termination or arbitrary code execution

  Description: A memory corruption issue exists in QuickTime's handling of movie files. By enticing a user to access a maliciously crafted movie file, an attacker can trigger the issue which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of movie files. Credit to Jonathan 'Wolf' Rentzsch of Red Shed Software for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2007-2296

  Available for: Mac OS X v10.3.9, Mac OS X v10.4.9 or later, Windows Vista, XP SP2

  Impact: Viewing a maliciously crafted .m4v file may lead to an unexpected application termination or arbitrary code execution

  Description: An integer overflow vulnerability exists in QuickTime's handling of .m4v files. By enticing a user to access a maliciously crafted .m4v file, an attacker can trigger the issue which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of .m4v files. Credit to Tom Ferris of Security-Protocols.com for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2007-2394

  Available for: Mac OS X v10.3.9, Mac OS X v10.4.9 or later, Windows Vista, XP SP2

  Impact: Viewing a maliciously crafted SMIL file may lead to an unexpected application termination or arbitrary code execution

  Description: An integer overflow vulnerability exists in QuickTime's handling of SMIL files. By enticing a user to access a maliciously crafted SMIL file, an attacker can trigger the issue which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of SMIL files. Credit to David Vaartjes of ITsec Security Services, working with the iDefense VCP, for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2007-2397

  Available for: Mac OS X v10.3.9, Mac OS X v10.4.9 or later, Windows Vista, XP SP2

  Impact: Visiting a malicious website may lead to arbitrary code execution

  Description: A design issue exists in QuickTime for Java, which may allow security checks to be disabled. By enticing a user to visit a web page containing a maliciously crafted Java applet, an attacker can trigger the issue which may lead to arbitrary code execution. This update addresses the issue by performing a more accurate permissions check. Credit to Adam Gowdiak for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2007-2393

  Available for: Mac OS X v10.3.9, Mac OS X v10.4.9 or later, Windows Vista, XP SP2

  Impact: Visiting a malicious website may lead to arbitrary code execution

  Description: A design issue exists in QuickTime for Java. This may allow Java applets to bypass security checks in order to read and write process memory. By enticing a user to visit a web page containing a maliciously crafted Java applet, an attacker can trigger the issue which may lead to arbitrary code execution. This update addresses the issue by performing additional validation of Java applets. Credit to Adam Gowdiak for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2007-2396

  Available for: Mac OS X v10.3.9, Mac OS X v10.4.9 or later, Windows Vista, XP SP2

  Impact: Visiting a malicious website may lead to arbitrary code execution

  Description: A design issue exists in QuickTime for Java. JDirect exposes interfaces that may allow loading arbitrary libraries and freeing arbitrary memory. By enticing a user to visit a web page containing a maliciously crafted Java applet, an attacker can trigger the issue which may lead to arbitrary code execution. This update addresses the issue by removing support for JDirect from QuickTime for Java. Credit to Adam Gowdiak for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2007-2402

  Available for: Mac OS X v10.3.9, Mac OS X v10.4.9 or later, Windows Vista, XP SP2

  Impact: Visiting a malicious website may lead to the disclosure of sensitive information

  Description: A design issue exists in QuickTime for Java, which may allow a malicious website to capture a client's screen content. By enticing a user to visit a web page containing a maliciously crafted Java applet, an attacker can trigger the issue which may lead to the disclosure of sensitive information. This update addresses the issue by performing a more accurate access control check.

iWeb: Shadows behind photos not visible in Firefox

This article has been archived and is no longer updated by Apple.

Issue or symptom

Photos with shadows behind their frames, such as those used on pages with the Goldenrod theme, do not display as expected when viewed in Firefox—the shadows are missing.

Solution

This is expected, Firefox does not support shadows.

Final Cut Pro 6: About loading network settings on a per-workstation basis

This article has been archived and is no longer updated by Apple.

Final Cut Pro checks local and network directories on startup

Each time it is opened, Final Cut Pro checks two local directories for Easy Setups, plug-ins, master templates, window and keyboard layouts, button bars, and so forth. Final Cut Pro can also check a network path.

Final Cut Pro checks these local directories:

- `/Users/username/Library/Preferences/Final Cut Pro User Data/`
- `/Library/Application Support/Final Cut Pro System Settings/`

Final Cut Pro checks this network path:

- `/Network/Library/Application Support/Final Cut Pro/`

The network path is accessible if:

- Your computer is connected to a server running Mac OS X Server.
- Your network administrator has properly configured the accounts within your local network so that your computer has access to the above directory.

To disable loading network settings on a per-workstation basis

If your network environment is configured as mentioned above, you can disable loading settings from the network on a per-workstation basis.

Follow the instructions below for each Final Cut Pro workstation that you do **not** want to check the network for settings:

1. Open TextEdit (or another text editing application).
2. Choose **Save** from the **File** menu.
3. Name the text file "DisableNetworkPlugins.txt" and save it to the following location on the local workstation:
   `/Library/Application Support/Final Cut Pro System Support/Plugins/`

For more information about setting up accounts within your local network, contact your network administrator or the documentation included with Mac OS X Server.

Final Cut Studio 2: Tips for creating and using templates

This article has been archived and is no longer updated by Apple.

Master templates in Final Cut Pro are templates created in Motion that allow you to quickly customize design elements such as titles and opening credits. This article discusses some issues to keep in mind when creating templates in Motion and when using them in Final Cut Pro.

- When you create templates in Motion, it's important to save them as templates, and not as regular Motion projects. In Motion, choose **Save as Template** from the **File** menu to save a project as a template that can be used in Final Cut Pro and in Motion. When you **Save as Template** in Motion, your project will automatically be coordinated with the Template Browser. If you merely chose **Save**, or if you use Finder to place standard Motion projects in the locations where Motion Templates are stored, the templates might not perform as desired in the Template Browser, and may not open as expected in Final Cut Pro.

- Don't use the Finder to move or rename templates. If you do, any instances of the template used in projects may go offline, or may otherwise not perform as expected. To rename a template or save it in a different theme, do the following:
  1. Open the template in Motion.
  2. From the **File** menu, choose **Save as Template...**.
  3. Type a name for the template.
  4. Choose a theme where you want to keep it (click **New Theme...** to create a new theme for your new or customized templates).
  5. Click Save.

- Don't use the Finder to create aliases of templates or theme folders. Aliases are not supported by the Template Browser.

- When a Motion template file is saved in Motion, the video standard assigned to the template is stored in a metadata tag, but it does not ensure that the resolution and frame rate will correspond in all Final Cut Pro sequences. Make sure that the templates you create and choose have the resolution and frame rate you want.

For more information about using master templates in Final Cut Pro, refer to the Final Cut Pro User Manual, available in Final Cut Pro's Help menu. For more information about creating templates in in Motion, refer to the Motion User Manual, available in Motion's Help menu.

Power Macintosh G3 300 MHz: Printing to LW 300, 350 w/ VM off

Apple has discovered an issue printing to the LaserWriter 300 and LaserWriter 350 from 300 MHz Power Macintosh G3 computers that have virtual memory turned off.
This article has been archived and is no longer updated by Apple.
Symptoms include one or more of the following:

- Following error message: "Communication error with the LaserWriter 300 printer has occurred. Please check the Peripheral 8 cable connections and try printing again."
- No error but only prints a blank page
- No error but output is vertically compressed

Workaround

Turn on virtual memory if printing to a LaserWriter 300 or LaserWriter 350 from a 300 MHz Macintosh G3 computer.

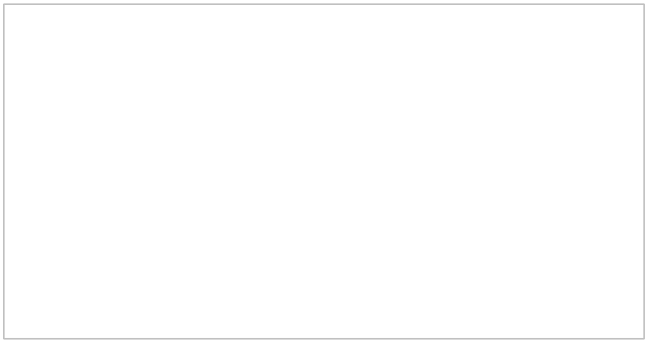
Update to iOS 12

Enjoy a faster and more responsive experience as well as fun new features, like Memoji and Camera Effects.

Get iOS 12



Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

AppleScript: Calling the File Transfer Element in Mac OS X 10.5

This article has been archived and is no longer updated by Apple.

When using AppleScript in Mac OS X 10.5 Leopard, the "Service" property of the "File Transfer" element may use a slightly different nomenclature than expected.

For example, if you were to write a script that returns attributes about a file transfer, you could notice the term "Service" actually representing the "Account" field, whereas the "Account" term is actually representing the "Buddy" field.

This does not impact the ability to write AppleScripts using these terms, it is merely a different use of terminology.

Final Cut Pro 6.0.1: About transferring AVCHD footage

This article has been archived and is no longer updated by Apple.

You can transfer AVCHD footage to your scratch disk using the Log and Transfer window in Final Cut Pro. The workflow for transferring AVCHD footage from a camcorder or disk is similar to the Panasonic P2 workflow. However, there are some important differences:

- AVCHD support is available only on Intel-based Macintosh computers.
- AVCHD camcorders typically connect to computers via USB 2.0, not FireWire.
- DVD-based AVCHD camcorders are not currently supported in Mac OS X.
- Standard definition video recorded with AVCHD camcorders cannot be accessed in the Log and Transfer window.
- Preview of AVCHD video in the Log and Transfer window is limited to 1x forward playback. Scrubbing the playhead does not update the video in the Preview area until you stop scrubbing.
- AVCHD footage is transcoded to the Apple ProRes 422 codec or the Apple Intermediate Codec. You can choose the destination codec in the Log and Transfer window preferences.
- When you choose to transfer AVCHD audio in the Logging area, audio is automatically mixed down to stereo.
- It is not possible to delete clips on an AVCHD volume, even if read-and-write permissions on the volume are set to allow file deletion. This behavior is different on P2 volumes, where clip deletion is allowed when proper read-and-write permissions are set.
- AVCHD files are transferred as entire files from beginning to end. It is not possible to set In and Out points before transferring the clips.

For more information about AVCHD, refer to the document, HD and Broadcast Formats, available under the Help menu in Final Cut Pro 6.0.1

Related article

- 305833: "Final Cut Pro 6.0.1: Working with spanned AVCHD clips"
- 305831: "Final Cut Pro 6.0.1: Incorrect AVCHD clips may be transferred"

This document will be updated as more information becomes available.

iPhone: Disconnecting iPhone from Your Computer

This article has been archived and is no longer updated by Apple.

Unless iPhone is syncing with your computer, you can disconnect iPhone from your computer at any time.

When iPhone is syncing with your computer, iPhone shows "Sync in progress." If you disconnect iPhone before it's done syncing, some data may not have been transferred. When iPhone is done syncing, iTunes shows "iPhone sync is complete."

To cancel a sync so you can disconnect iPhone, drag the slider on iPhone.

Tip: If you get a call during a sync, the sync is cancelled automatically and you can unplug iPhone to answer the call. Connect iPhone after the call to finish syncing.

Mac OS X Server: Frequently Needed Device Names

During installation of Mac OS X Server, a number of devices are probed and initialized. Booting in verbose mode (-v argument) allows you to watch the initialization process as Mach/BSD initializes the system.
This article has been archived and is no longer updated by Apple.
To aid in following the flow, and to better understand Open Firmware designations, here is a short list of some of the more important devices:

scX	SCSI Controller	Typically, sc0 and sc1
sdX(y)	SCSI Device (partition)	X = integer, y = alphabetic partition number, ie, sd0
hcX	hardware (IDE) controller	usually hc0
hdX(y)	IDE Device (partition)	X = integer, y = alphabetic partition number, ie, hd0
enX	ethernet interface	usually en0 or en1

There are many other Mach/BSD device types. These few represent the ones you are most likely to need to know.

iPhoto: How to determine which version of iPhoto you are using

This article has been archived and is no longer updated by Apple.

Follow these steps to determine which version of iPhoto you are using:

1. Open iPhoto.
2. From the iPhoto menu, choose **About iPhoto**. A window appears that displays your iPhoto version.

Check to see if an update is available for iPhoto by running Software Update from your computer..

Published Date: Feb 20, 2012

Common Mailman administrative tasks

This article has been archived and is no longer updated by Apple.

This advanced article describes how to perform some common Mailman tasks:

- Reset Mailman to defaults
- Back up Mailman data
- Restore from a Mailman backup
- Migrating from one server to another

Reset Mailman to defaults

1. Make sure that Mailman is not running. Mailman can be stopped in Terminal with this command:

   ```
   sudo /usr/share/mailman/bin/mailmanctl stop
   ```

   If Mailman is not running, it is OK if a message such as this appears:
   "PID unreadable in: /private/var/mailman/data/master-qrunner.pid
   [Errno 2] No such file or directory: '/private/var/mailman/data/master-qrunner.pid'Is qrunner even running?"

2. Move the existing Mailman database directory. In Terminal:

   ```
   sudo mv /var/mailman /var/mailman.old
   ```

3. Create new mailman database directory and sub-directories with these Terminal commands:

   - `sudo mkdir /var/mailman`
   - `sudo mkdir /var/mailman/archives`
   - `sudo mkdir /var/mailman/archives/private`
   - `sudo mkdir /var/mailman/archives/public`
   - `sudo mkdir /var/mailman/data`
   - `sudo mkdir /var/mailman/lists`
   - `sudo mkdir /var/mailman/locks`
   - `sudo mkdir /var/mailman/logs`
   - `sudo mkdir /var/mailman/qfiles`
   - `sudo mkdir /var/mailman/spam`

4. Set permissions on newly-created directories with this Terminal command:

   ```
   sudo /usr/share/mailman/bin/check_perms -f
   ```

5. Restart Mailman's master qrunner by running the following command.

   ```
   sudo /usr/share/mailman/bin/mailmanctl start
   ```

Back up Mailman data

1. Make sure that Mailman is not running. Mailman can be stopped in Terminal with this command:

   ```
   sudo /usr/share/mailman/bin/mailmanctl stop
   ```

   If Mailman is not running, it is OK if a message such as this appears:
   "PID unreadable in: /private/var/mailman/data/master-qrunner.pid
   [Errno 2] No such file or directory: '/private/var/mailman/data/master-qrunner.pid'Is qrunner even running?"

2. Execute this Terminal command, replacing the target path as desired:

   `ditto -c -z /var/mailman` *(Path_to_backup_file)*

3. Restart Mailman's master qrunner with the following command.

   ```
   sudo /usr/share/mailman/bin/mailmanctl stop
   ```

Restore from a Mailman backup

1. Make sure that Mailman is not running. Mailman can be stopped in Terminal with this command:

   ```
   sudo /usr/share/mailman/bin/mailmanctl stop
   ```

   If Mailman is not running, it is OK if a message such as this appears:
   "PID unreadable in: /private/var/mailman/data/master-qrunner.pid
   [Errno 2] No such file or directory: '/private/var/mailman/data/master-qrunner.pid'Is qrunner even running?"

2. Move the existing Mailman database directory via Terminal:

   ```
   sudo mv /var/mailman /var/mailman.old
   ```

3. Restore from a backup with this command:

   ```
   ditto -x (Path_to_backup_file) /var/mailman
   ```

   Note that there is a space after -x and before /var.

4. Set permissions on newly created directories with:

   ```
   sudo /usr/share/mailman/bin/check_perms -f
   ```

5. Restart Mailman's master qrunner by running the following command:

   ```
   sudo /usr/share/mailman/bin/mailmanctl stop
   ```

Migrating from one server to another

1. Log in to the new Mailman server as root (or "sudo -s" to become root).
2. Make sure that Mailman is not running. Mailman can be stopped in Terminal with this command:

   ```
   sudo /usr/share/mailman/bin/mailmanctl stop
   ```

   If Mailman is not running, it is OK if a message such as this appears:
   "PID unreadable in: /private/var/mailman/data/master-qrunner.pid
   [Errno 2] No such file or directory: '/private/var/mailman/data/master-qrunner.pid'Is qrunner even running?"

3. Run the following Terminal command, replacing *(FQDN)* with the fully qualified domain name of the previous Mailman server.

   ```
   ssh (FQDN) ditto -c /var/mailman - | ditto -x - /var/mailman
   ```

   This will copy the mailman data to the new server over an ssh connection.

4. Set permissions on newly-created directories with:

   ```
   sudo /usr/share/mailman/bin/check_perms -f
   ```

5. Log in to the new Mailman server as an administrator and execute the following Terminal command on a single line. *(FQDN)* with the fully qualified domain name of the new Mailman server. This will change the URL information for the mailing lists to the new server's fully qualified domain name.

```
sudo /usr/share/mailman/bin/list_lists -b | xargs -I'{}' sudo /usr/share/mailman/bin/withlist -l -r fix_url '{}' -u (FQDN) -v
```

6. Restart Mailman's master qrunner by running the following command.

   ```
   sudo /usr/share/mailman/bin/mailmanctl start
   ```

Motion: Motion unexpectedly quits after MacBook Pro Software Update 1.0

This article has been archived and is no longer updated by Apple.

Issue or symptom

When running Motion (included with Final Cut Studio) after installing MacBook Pro Software Update 1.0 on a MacBook Pro 2.2 or 2.4 GHz computer, Motion may unexpectedly quit.

Solution

Download and install MacBook Pro Software Update 1.1.

Published Date: Oct 10, 2016

Mac OS X 10.5: About syncing with a Motorola RAZR V6 MAXX phone

This article has been archived and is no longer updated by Apple.

Issue or symptom

You may notice that syncing a Motorola RAZR V6 MAXX phone with iSync takes a little longer than some other Motorola phones in Mac OS X 10.5.

Solution

It may take around four minutes to sync the phone, depending on the amount of data on the phone and/or if the contents were deleted first and are being re-synced from your Mac.

You should wait for iSync to complete the sync. Do not unpair the phone after beginning a sync session.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Feb 20, 2012

iPhoto 6: Dragging RAW files from iPhoto to Finder

This article has been archived and is no longer updated by Apple.

Issue or symptom

Dragging a rotated RAW file from iPhoto to the Finder produces a JPEG proxy file instead of a copy of the original, unedited RAW file. It does not matter if the file was rotated manually or automatically.

Solution

To ensure that the original, unedited RAW file is copied, press and hold the **Option** key when dragging a file out of iPhoto.

This document will be updated as more information becomes available.

MacBook Pro: Video display issues after installing EFI Firmware Update 1.3

This article has been archived and is no longer updated by Apple.

Issue or symptom

After installing EFI Firmware Update 1.3 on a MacBook Pro (15-inch 2.2 or 2.4GHz), the internal video display may appear bluish in color, like a 'waterfall', or display other 'shimmering' video effects. This effect persists on the internal display through restarts and resolution changes.

Solution

- Reset the PRAM/NVRAM on your MacBook Pro.
- See article 2238 for instructions on how to reset PRAM.

Published Date: Feb 20, 2012

Final Cut Pro 6: Rendered items may require re-rendering after opening project

This article has been archived and is no longer updated by Apple.

Issue or symptom

In some cases, rendered items may become unrendered after quitting and then re-opening a project in Final Cut Pro 6. In these cases, the render bar will indicate that the items are rendered, but if you attempt to play the video, you will see "Unrendered" in the Canvas.

This can happen if you duplicate a sequence with rendered items, then quit, then re-open Final Cut Pro. The duplicated sequence will remain rendered, but the original sequence may require re-rendering.

Solution

This issue has been resolved in Final Cut Pro 6.0.2. Final Cut Studio 2 users can update to Final Cut Pro 6.0.2 by choosing **Software Update** from the **Apple** menu.
Notice: Pro Applications Update 2007-02 needs to be installed first. Afterwards, you will see updates for Final Cut Studio 2 applications in Software Update.

Published Date: Feb 20, 2012

Final Cut Pro 6.0.1: H.264 playback in Viewer results in "General Error"

This article has been archived and is no longer updated by Apple.

Issue or symptom

In Final Cut Pro 6.0.1, if you attempt to load an H.264 clip into the Viewer, the clip might not be shown and a "General Error" message may appear.

Affected Products:

- Final Cut Pro 6.0.1
- H.264 format media files
- QuickTime 7.1.6

Solution

Download and install QuickTime 7.2 or later. If your Final Cut Pro system is connected to the Internet, you can update QuickTime by choosing **Software Update** from the **Apple** menu.

Published Date: Feb 20, 2012

DVD Studio Pro 4: Creating buttons that play only specific chapters of a video track

This article has been archived and is no longer updated by Apple.

DVD Studio Pro 4 gives you the choice of playing individual chapters separately, without having to play the rest of a track, by using the Story feature. This may be helpful if you would like a short piece of the track as a preview in your project, for example.

Here is one way you can create buttons that play only specific chapters of a video track in DVD Studio Pro 4:

1. Create a Menu that you would want to go back to when finished playing a chapter.
2. Import a movie with existing chapter markers (from Final Cut Pro or Compressor, for example), then add to the video track stream in the Track Editor. Or, you can import a movie and add chapter markers in the Track Editor (See the DVD Studio Pro User Manual page 70 for more information).
3. In the Track Editor, select each chapter marker you want to play individually, then set the End Jump in the Inspector to the Menu you just created.
4. Create a new Story for the Video stream by selecting the Video Track, then from the **Project** menu choose **Add to Project > Story**.
5. Double click the Story track to get the Story Editor.
6. Move all the chapters from the left side of the Editor to the right side.
7. Go back to the Menu you created earlier and create a new button.
8. Set the button's target to your Story track (this is now your "Play All" button).
9. Create a Button for each Chapter you would like to play individually.
10. Select each of these buttons individually, then set the Target to the chapter you would like that button to play.

For more information, from the DVD Studio Pro **Help** menu choose **DVD Studio Pro User Manual**.

Mac OS X Server: What Unix-Compatible Alternatives Are There?

My hardware will not support Mac OS X Server. What are my other options for accessing Unix-style functionality?
This article has been archived and is no longer updated by Apple.
Alternatives:

- MkLinux, now part of The Research Institute at Grenoble, is still available from non-Apple mirror sites. The MkLinux web site at http://www.mklinux.org contains links to all non-Apple sites where MkLinux can be downloaded.
- MachTen, from Tenon Intersystems, http://www.tenon.com, is a BSD Unix implementation that runs as a Mac OS application. Mac and Unix applications can be run side-by-side.
- LinuxPPC is a non-Apple version of a Unix-style operating system that is available from **http://www.linuxppc.org**

If intercommunication with non-Mac OS X Server Unix-compatible systems from within the Mac OS is your goal, an X11 server for Mac OS such as Apple's MacX, White Pine's eXodus, or Tenon's X-Ten are some of the solutions available. An X11 server gives a workstation the ability to display and interact with X11 applications ("clients": backwards from usual terminology) running on traditional Unix-compatible servers or hosts such as Sun, HP, Cray, linux, SCO, and many others.

There are also a variety of Unix-compatible systems that are available for 68000 series Mac OS computers.

Final Cut Pro: Error 12 message when performing Media Manager operation on clip with long file name

This article has been archived and is no longer updated by Apple.

Issue or symptom

Performing a Media Manager operation on clips that have long names may result in this alert message:

> "**Media Manager File Trim Failed**
> The attempt to Trim '*(your_clip_with_long_filename)*' failed with an error code of 12. You can retry this operation, skip this file, or abort the operation entirely."

In the specific case described in this article, the error message will refer to an error code of 12.

Product affected

- Final Cut Pro

Solution

In the Finder, rename the media files so that is contains 32 or fewer characters (or, 15 or fewer double-byte language characters). This character limit includes spaces and the filename extension.

Note: Renamed files may be reported as offline and need to be reconnected in Final Cut Pro.

Additional information

This can occur if you choose the following Media Manager options on a clip that has a long name (such as "This is a clip of cupcakes that look really yummy"):

- Media: Use existing
- "Delete unused media from selected clip" is enabled
- "Duplicate selected clip and place into a new project" is disabled

This can occur with clips that have filenames (in the Finder) of 33 or more total characters, including spaces and the file extension.

With double-byte language characters (Japanese, for example), this can occur with clips that have file names (in the Finder) of 16 or more characters, including spaces and the file extension.

This document will be updated as more information becomes available.

Mac OS X Server: Are Mac OS Disk Formats Supported?

Does Mac OS X Server support Mac OS standard (HFS) and Mac OS extended (HFS+) disk formats?
This article has been archived and is no longer updated by Apple.
Mac OS X Server supports Mac OS standard and Mac OS extended formats, and volumes with this format can be auto-mounted within the Mach/BSD environment.

Mac OS disk format support is provided by the utility "`hfs.util`" found in `/usr/filesystems/hfs.fs/`. This service is on by default. Administrative access is needed to change its status.

Files that Mac OS X Server inherently understands (.tiff, .html, text, Read Me files, and some others) can be double-clicked within the Mac OS X Server Workspace Manager, and they will open in the appropriate applications. Some other file types may be opened from within an appropriate application.

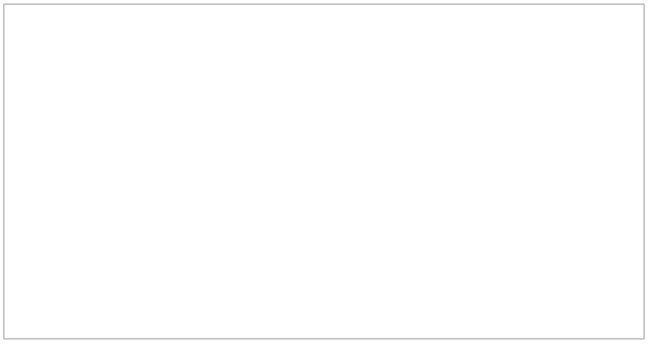
Update to iOS 12

Enjoy a faster and more responsive experience as well as fun new features, like Memoji and Camera Effects.

Get iOS 12



Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

Mac OS X: VPN settings unavailable after using Migration Assistant

This article has been archived and is no longer updated by Apple.

Issue or symptom

VPN settings in Internet Connect VPN may not appear to be transferred when using Migration Assistant to transfer a user's Home from one computer to another.

Solution

The settings actually are transferred but just not accessed. You can either enter them manually again, or access your VPN settings with these steps:

1. From the Finder's **Go** menu, choose **Go to Folder**.
2. Go to (type) this folder path, followed by Return:

   ```
   ~/Library/Preferences/ByHost
   ```

   The ByHost window opens. You might want to view as a List (press Command-2).

3. In the ByHost folder, select (click one time) the file named "com.apple.networkConnect.##########.plist" (where "##########" is a series of numbers and letters, the Ethernet ID).
4. From the Finder's **File** menu, choose any color label that you wish so that the file is easy to recognize in the ByHost folder.

5. From the Finder's **Go** menu, choose **Applications**.
6. Open Internet Connect.
7. From the Internet Connect **File** menu, choose **Import Configuration**.
8. Drag the color-labeled "com.apple.networkConnect..." file from the ByHost folder to the Import Configuration window.
9. Click Open. The VPN settings should now be available.

   Note: The Ethernet ID can be found in Network preferences or in Network Utility (located in /Applications/Utilities). In Network preferences, select the interface from the "Network Status" pop-up menu, click the "Configure..." button, then click the Ethernet tab.

Mac OS X 10.4 Server: Using cyradm to delete a user‘s mailboxes from the mail store

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you delete an email user from Mac OS X 10.4 Server, the deleted user's mailboxes are not automatically removed from the mail store.

Products affected

- Mac OS X 10.4 Server

Solution

Use these steps to remove the deleted user's mailboxes.

Note: These steps involve editing a cyrus configuration file. If you're not familiar with editing text configuration files, see this article before proceeding.

1. Open the file (/etc/imapd.conf) and look for this line:
   `admins: cyrusimap`
2. Consider which user that you would like to be able to function as the mail administrator. The local administrative account may be a good choice. Add that user's short name after `cyrusimap` separated by a comma and space. For example, if the administrator has a short name of "appleadmin", the result should look like this:

   ```
   admins: cyrusimap, appleadmin
   ```
3. Save the file and restart the Mail service with Server Admin.

   Note: The administrator that was set up in the previous step must have IMAP mail enabled for them in Workgroup Manager. In addition, IMAP access must be enabled in Server Admin -> Mail -> Settings -> General. Verify that the account has IMAP mail enabled in Server Admin and, if not, enable it.
4. Open Terminal on the server and enter the following command on a single line:

   ```
   /usr/bin/cyrus/admin/cyradm -u appleadmin localhost
   ```
5. You'll be prompted for the account password. Enter it, then you'll see the cyradm interactive prompt:

   ```
   localhost>
   ```

   Note: If desired, type "?" (without quotes) to see a full command list and explanation of each command.

   Note: To see a list of all the user's mailboxes, use the `lm *username*` command.
6. Use the `sam` command to create an ACL on the mailbox so that appleadmin has access to delete it.
7. Use the `dm` command to delete the appropriate mailbox.

Example

After a user named "misteruser" has been deleted from Workgroup Manager:

1. Complete steps 1-4 above.
2. get a list of just misteruser's mailboxes with this command (at the `localhost>` prompt):

   ```
   lm *misteruser*
   ```

   This shows mailboxes such as this:

```
Other Users/misteruser (\\HasChildren)
Other Users/misteruser/Sent Messages (\\HasNoChildren)
Other Users/misteruser/Drafts (\\HasNoChildren)
Other Users/misteruser/Sent Messages (\\HasNoChildren)
```

3. Examine the current ACL on their top-level mailbox with `lam`:

   ```
   lam Other\\ Users/misteruser
   ```

   This shows output such as this:

   ```
   misteruser lrswipcda
   ```

4. Create a full control ACL for the appleadmin user with this command:

   ```
   sam Other\\ Users/misteruser appleadmin lrswipcda
   ```

5. Verify the new ACL has been created:

   ```
   lam Other\\ Users/misteruser
   ```

   This shows output such as this:

   ```
   misteruser lrswipcda
   appleadmin lrswipcda
   ```

6. Delete misteruser's mailbox:

   ```
   dm Other\\ Users/misteruser
   ```

7. Verify that it's deleted:

   ```
   lm *misteruser*
   ```

Xsan 1.4.2 and earlier: cvcp does not copy extended attributes for individual file copies

In Xsan 1.4.2 and earlier, copying an individual file using `cvcp` does not copy the file's extended attributes. Since preservation of a file's extended attributes is essential for proper functioning of many file types, you should avoid copying files with `cvcp` in this way.

This article has been archived and is no longer updated by Apple.

To ensure extended attributes are copied in Xsan 1.4.2 and earlier, copy files using one of these ways:

1. Use the Finder (drag and drop).
2. With Mac OS X v10.4 and later, use the command line utility `cp` . Run `man cp` to learn more.
3. If using `cvcp`, copy the directory containing the files you would like to copy instead of copying files individually.

Xsan 2.1.1 and earlier versions store extended attributes in AppleDouble files, which are not visible in the Finder. In Xsan 1.4.2 and earlier versions, these AppleDouble files are not copied when copying files individually using cvcp. However, when copying a directory, all files within the directory are copied--including any AppleDouble files in the directory.

To learn more about the `cvcp` utility, type `man cvcp` in Terminal on a Mac that has Xsan installed.

iMovie: Format external hard disks as HFS Extended for best performance

This article has been archived and is no longer updated by Apple.

Because digital video can take up a significant amount of hard drive space, storing your digital video on an external hard disk can be a convenient way to prevent your Mac OS X hard disk from becoming full.

Format your FireWire or USB 2.0 hard disk as **HFS Extended** for best performance with iMovie. Some hard disks come from the factory in other formats that are not as well suited for iMovie.

Formating an external hard disk is usually done when it's brand new. If you want to reformat a drive that already contains data, be sure to back up the data to another drive beforehand. **NOTICE:** Reformatting a hard disk will permanently erase all of the data on it.

Tip: You can check the format of your hard drive by clicking its icon in Finder and then choosing **Get Info** from the File menu. The format is displayed in General information in the Info window.

To format a hard disk as HFS Extended

Note: Formatting a hard drive will permanently erase all of the data on it. Formatting an external hard drive is usually something you'll do when it's brand new. If you want to format a drive that already contains data, be sure to back up the data to another drive beforehand.

1. Connect your external hard drive to your computer.
2. Open Disk Utility from the Utilities folder in Applications.
3. Select the name of your hard disk in the left column of the Disk Utility window so that it's highlighted.
4. Click **Erase** to show the formatting options pane.
5. From the Volume Format menu, choose **Mac OS Extended**.
6. Click **Erase** (in the lower-right corner).

Note: USB 2.0 hard disks work best with iMovie when directly connected to your computer. Disks connected to an Airport Base Station are not supported with iMovie. USB 1.x disks are not supported with iMovie.

.Mac: Renaming your Web Gallery

This article has been archived and is no longer updated by Apple.

The default title of your .Mac Web Gallery is "My Gallery". If you want to change it, follow these steps:

1. Open iPhoto '08.
2. From the **iPhoto** menu, choose **Preferences**.
3. Click on the Web Gallery icon at the top of the Preferences window.
4. Change the text in the "Web Gallery Title" field to whatever want your Web Gallery to be called.
5. Close the preferences window.

Your Web Gallery will automatically be updated.

.Mac: Viewing your private Web Gallery album on the Web

This article has been archived and is no longer updated by Apple.

If you have published a private album from iPhoto '08 to your .Mac Web Gallery (an album in which you chose "Only me" from the "Album Viewable by:" pop-up menu) , you can access it on the Web via the album's direct URL. If you don't know the URL to your private album, you can find it in iPhoto '08:

1. Open iPhoto '08.
2. Select your published album in the iPhoto Source list (under Web Gallery). The contents of the private album appear in the iPhoto viewing area. The URL appears under the title.
3. Click the arrow to the right of the title to go to the Web Gallery on the Internet.

   Tip: Bookmark the album in your Web browser.

Additional information

For information on publishing protected Web Gallery albums, see ".Mac: Protecting Web Gallery movies with a password". To publish a private album, chose "Only me" from the "Album Viewable by:" pop-up menu (instead of choosing "Edit names and passwords") in the iPhoto publishing sheet.

Power Macintosh: Power light delay at Startup

I'm using a Power Macintosh 6500 and I get a 45 second delay during the startup. I think this delay might be similar to the one the 6400/6360/5400's had after OS 7.6.1 was released. I'm measuring the delay from the time the startup chime occurs to when the power light comes on. What's going on?
This article has been archived and is no longer updated by Apple.
A delay in the power light to appear may occur on cold starts (i.e. starting up after a shutdown, instead of a restart). The delay occurs during the memory/hardware test phase of the boot process. The delay can be longer in seconds based on the amount of RAM that is installed.

For customers that are unhappy with this delay, Mac OS 8.5 offers a hidden feature to disable the startup memory tests. To do this in Mac OS 8.5, hold down the" Command - Option" keys while opening the Memory control panel. Below the RAM disk information part of the window, there will be a set of radio buttons to selectively turn on or off the startup memory tests.

About the security content of iPhone v1.0.1 Update

This article has been archived and is no longer updated by Apple.

This document describes the security content of iPhone v1.0.1 Update, which can be downloaded and installed via iTunes as described below.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

iPhone v1.0.1 Update

- **Safari**

  CVE-ID: CVE-2007-2400

  Available for: iPhone v1.0

  Impact: Visiting a malicious website may allow cross-site scripting

  Description: Safari's security model prevents JavaScript in remote web pages from modifying pages outside of their domain. A race condition in page updating combined with HTTP redirection may allow JavaScript from one page to modify a redirected page. This could allow cookies and pages to be read or arbitrarily modified. This update addresses the issue by correcting access control to window properties. Credit to Lawrence Lai, Stan Switzer, and Ed Rowe of Adobe Systems, Inc. for reporting this issue.

- **Safari**

  CVE-ID: CVE-2007-3944

  Available for: iPhone v1.0

  Impact: Viewing a maliciously crafted web page may lead to arbitrary code execution

  Description: Heap buffer overflows exist in the Perl Compatible Regular Expressions (PCRE) library used by the JavaScript engine in Safari. By enticing a user to visit a maliciously crafted web page, an attacker may trigger the issue, which may lead to arbitrary code execution. This update addresses the issue by performing additional validation of JavaScript regular expressions. Credit to Charlie Miller and Jake Honoroff of Independent Security Evaluators for reporting these issues.

- **WebCore**

  CVE-ID: CVE-2007-2401

  Available for: iPhone v1.0

  Impact: Visiting a malicious website may allow cross-site requests

  Description: An HTTP injection issue exists in XMLHttpRequest when serializing headers into an HTTP request. By enticing a user to visit a maliciously crafted web page, an attacker could trigger a cross-site scripting issue. This update addresses the issue by performing additional validation of header parameters. Credit to Richard Moore of Westpoint Ltd. for reporting this issue.

- **WebKit**

  CVE-ID: CVE-2007-3742

  Available for: iPhone v1.0

  Impact: Look-alike characters in a URL could be used to masquerade a website

  Description: The International Domain Name (IDN) support and Unicode fonts embedded in Safari could be used to create a URL which contains look-alike characters. These could be used in a malicious web site to direct the user to a spoofed site that visually appears to be a legitimate domain. This update addresses the issue by through an improved domain name validity check. Credit to Tomohito Yoshino of Business Architects Inc. for reporting this issue.

- **WebKit**

TA24874_About_the_security_content_of_iPhone_v_Update.pdf

CVE-ID: CVE-2007-2399

Available for: iPhone v1.0

Impact: Visiting a maliciously crafted website may lead to an unexpected application termination or arbitrary code execution

Description: An invalid type conversion when rendering frame sets could lead to memory corruption. Visiting a maliciously crafted web page may lead to an unexpected application termination or arbitrary code execution. Credit to Rhys Kidd of Westnet for reporting this issue.

Installation note

This update is only available through iTunes, and will not appear in your computer's Software Update application, or on the Apple Support Downloads site. Make sure you have an Internet connection and have installed the latest version of iTunes from (www.apple.com/itunes).

iTunes automatically checks Apple's update server on its weekly schedule. When an update is detected, it will download it. When the iPhone is docked, iTunes will present the user with the option to install the update. We recommend applying the update immediately if possible. Selecting "don't install" will present the option the next time you connect your iPhone. The automatic update process may take up to a week depending on the day that iTunes checks for updates.

You can manually obtain the update via the "Check for Updates" button or menu choice in iTunes. After doing this, the update can be applied when your iPhone is docked to your computer.

To check that the iPhone has been updated:

1. Navigate to Settings on the iPhone.
2. Click General.
3. Click About. The version after applying this update will be "1.0.1 (1C25)".

Published Date: Feb 20, 2012

About the security content of Safari 3 Beta Update 3.0.3

This article has been archived and is no longer updated by Apple.
This document describes the security content of Safari 3 Beta Update 3.0.3, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Safari 3 Beta Update 3.0.3

- **Safari**

  CVE-ID: CVE-2007-3743

  Available for: Windows XP or Vista

  Impact: Adding bookmarks may lead to an unexpected application termination or arbitrary code execution

  Description: A stack buffer overflow vulnerability exists in Safari's bookmark handling. By enticing a user to add a bookmark with an overlong title, an attacker may trigger the issue which may lead to an unexpected application termination or arbitrary code execution. This update addresses the issue by performing proper bounds checking. This issue does not affect Mac OS X systems.

- **WebKit**

  CVE-ID: CVE-2007-2408

  Available for: Mac OS X v10.4.9 or later, Windows XP or Vista

  Impact: Visiting a malicious website may allow Java applets to load and run even when Java is disabled

  Description: Safari provides an "Enable Java" preference, which when unchecked should prevent the loading of Java applets. By default, Java applets are allowed to be loaded. Navigating to a maliciously crafted web page may allow a Java applet to be loaded without checking the preference. This update addresses the issue through a stricter check of the "Enable Java" preference. Credit to Rhys Kidd and Scott Wilde for reporting this issue

- **WebKit**

  CVE-ID: CVE-2007-3742

  Available for: Mac OS X v10.4.9 or later, Windows XP or Vista

  Impact: Look-alike characters in a URL could be used to masquerade a website

  Description: The International Domain Name (IDN) support and Unicode fonts embedded in Safari could be used to create a URL which contains look-alike characters. These could be used in a malicious web site to direct the user to a spoofed site that visually appears to be a legitimate domain. This update addresses the issue by through an improved domain name validity check. Credit to Tomohito Yoshino of Business Architects Inc. for reporting this issue.

Mac OS X Server 10.4.10: NetBoot service does not start

This article has been archived and is no longer updated by Apple.

Issue or symptom

After updating to Mac OS X Server 10.4.10, the NetBoot service may not start automatically.

Solution

Using Server Admin, stop the NetBoot service and then start it again. This will configure the service to launch on startup properly.

Published Date: Feb 20, 2012

Remote Desktop: Managed Clients see blue screen when screen is locked

This article has been archived and is no longer updated by Apple.

Issue or symptom

When application access is restricted, managed Remote Desktop clients may see a blue screen when the screen is locked, and the screen may not be unlockable.

Solution

Restart the client computer to gain access to the computer.

To avoid the issue, if you're using Parental Controls to restrict application access, enable the "Allow Supporting Programs" option in the Finder & System settings.

If you're using Managed Client settings in Workgroup Manager on a Mac OS X Server, enable the "Allow approved applications to launch non-approved applications" option (also known as sub-launching).

Disk Copy 6.3 Scripts: Read Me

Note: For information on Disk Copy 6.3.3, see "Disk Copy 6.3.3: Read Me"

Description:
AppleScripts that extend the functionality of Disk Copy, version 6.3 or greater. They are provided as examples of how to use AppleScript to control Disk Copy, and gain access to features not present in the user interface. Create self-mounting image will prompt the user to select a disk image, verify it, then let the user save it as a self-mounting image. AppleScripts can be executed directly from Disk Copy by placing them in a folder named 'Scripts' in the same folder as Disk Copy. When a Scripts folder containing AppleScripts is present, a new menu will appear in Disk Copy named "Scripts". AppleScripts selected from this menu will have their "on run" handler executed.

Floppy insert preferences will prompt the user to decide what action Disk Copy will take if a floppy disk is inserted while Disk Copy is the foreground application. The "Make an Image" button will result in the floppy being saved as a disk image, and the "Copy" button will result in the floppy being copied and restored onto another floppy. Segment Image will ask the user how they want to segment an image (by size or number of parts), prompt the user to select a disk image, verify it, then save the image segmented. Using the Script Editor or other AppleScript script editor, the contents of the scripts can be viewed.

This software consists of a self-mounting Disk Copy compressed image (.smi) file. Download this software to your hard drive and then double-click it to use it. You do not need Disk Copy to access smi files.

Note: Disk Copy 6.3 Scripts, released July 17, 1998 requires Disk Copy 6.3 or greater, and a Mac OS based computer with AppleScript installed.

This article has been archived and is no longer updated by Apple.

Disk Copy Scripts Read Me

Create self-mounting image, Floppy insert preferences, and Segment Image are AppleScripts that extend the functionality of Disk Copy, version 6.3 or greater. They are provided as examples of how to use AppleScript to control Disk Copy, and gain access to features not present in the user interface.

This Read Me will explain the basic functions of these AppleScripts.

System requirements

Create self-mounting image, Floppy insert preferences, and Segment Image require Disk Copy 6.3 or greater, and a Mac OS based computer with AppleScript installed.

Script Descriptions

Create self-mounting image will prompt the user to select a disk image, verify it, then let the user save it as a self-mounting image

Floppy insert preferences will prompt the user to decide what action Disk Copy will take if a floppy disk is inserted while Disk Copy is the foreground application. The "Make an Image" button will result in the floppy being saved as a disk image, and the "Copy" button will result in the floppy being copied and restored onto another floppy.

Segment Image will ask the user how they want to segment an image (by size or number of parts), prompt the user to select a disk image, verify it, then save the image segmented.

Using the Script Editor or other AppleScript script editor, the contents of the scripts can be viewed.

Mac OS X Server: Anonymous FTP users cannot save to shares

This article has been archived and is no longer updated by Apple.

Issue or symptom

Anonymous FTP users cannot write to a share point, even though the file permissions allow it. A "Permission denied" alert message appears.

Solution

By default, anonymous users are only allowed to save files to the folder (/Library/FTPServer/FTPRoot/uploads) and its subfolders. Anonymous users are only allowed to create folders in (/Library/FTPServer/FTPRoot/uploads/mkdirs).

To change the default, follow these steps:

1. Set the home folder of the FTP user to the desired location.
    a. Open Workgroup Manager and connect to the server.
    b. Select the Local node in the pull-down under the tool bar.
    c. From the **View** menu, choose Show System Users and Groups.
    d. Select the FTP user.
    e. Edit the user's home in the Home tab. **Note**: If the FTP user is missing in Workgroup Manager, first connect to the FTP server as anonymous.

2. Open the file ftpaccess located in (/Library/FTPServer/Configuration/).
3. Locate these lines:

```
upload /Library/FTPServer/FTPRoot /uploads yes ftp daemon 0666 nodirs
upload /Library/FTPServer/FTPRoot /uploads/mkdirs yes ftp daemon 0666 dirs 0777
```

4. Replace "`/Library/FTPServer/FTPRoot`" with FTP user's home directory path in the above lines. The FTP server will use the FTP user home folder as root.
5. Save the changes.
6. The uploads folder needs to be created with the appropriate permissions for user FTP to allow saving to the share. Refer to this document for more information.

Apple System Profiler: Processor Speed and HD Space Calculation

This article explains why there are differences between what Apple System Profiler and the Finder report and what is listed on the computer's product data sheet.
This article has been archived and is no longer updated by Apple.
Apple System Profiler performs a calculation to determine processor clock speed based on 66.7 MHz system bus speed (66.7 * 5 = 333.5 MHz). When it calculates a value of 333.5 MHz, for example, it rounds up to the next whole digit (334 MHz in this case). Apple conservatively advertises this processor as 333 MHz because it is not quite 334 MHz.

Currently, the hard disk drive industry measures disk capacity as 1MB = 1,000,000 bytes (1000 * 1000). The Mac OS Finder and Apple System Profiler measure disk drive capacity as 1MB = 1,048,576 bytes (1024 * 1024).

For example, if you take a 4.0 GB hard drive (4000776192 bytes = total size), the following interpretations can occur: If you divide the total bytes by 1,048,576 bytes, the Mac OS Finder and Apple System Profiler show this space as follows: 4000776192 bytes = 3815.4375 MB = 3.7 GB
If you divide the total bytes by 1,000,000 bytes, the hard disk drive industry measures drive capacity as follows: 4000776192 bytes = 4000.776192 MB = 4.0 GB

For more information, see the related article:

Motion 3: Nudge keyboard command has no effect

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Motion 3 keyboard command for nudging objects by one pixel (Command-Arrow) has no effect.

Solution

Objects can be moved using the mouse pointer (cursor), or via controls in the Inspector.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

iPod shuffle (2nd Generation) may take 90 seconds to appear in iTunes

This article has been archived and is no longer updated by Apple.

Issue

When iPod shuffle is in a very low battery state, it may take up to 90 seconds after being connected to the computer before the device appears in iTunes.

Solution

Connect your iPod shuffle to a computer or wall charger and leave connected for at least 90 seconds. During this time iPod shuffle should have an amber light, but will not appear in iTunes. After 90 seconds, the iPod shuffle will appear in iTunes (if connected to a wall charger, then reconnect the iPod shuffle to the computer).

Mac mini (Mid 2007): displays black screen during DVD restore

This article has been archived and is no longer updated by Apple.

Issue or symptom

If your Mac mini (Mid 2007) goes into sleep mode after ejecting DVD1 during a restore from the DVDs that shipped with the computer, it may quit unexpectedly then display a black screen.

Solution

To work around this issue, perform the following steps:

1. Remove the DVD that was ejected.
2. Press and hold the power button on the back of the computer until the power LED on the front of the computer turns off. Once the LED is off, release the power button.
3. Press the power button on the back on the computer to turn the Mac mini on again. The Mac mini should restart and prompt you for DVD2.
4. Insert DVD2 to proceed with the restore.

iMac (Mid 2007): External features, ports and connectors

This article has been archived and is no longer updated by Apple.

Learn about the external features, ports and connectors on the iMac (Mid 2007) computer. All ports and connectors covered in this document are located on the Input/Output (I/O) panel on the bottom right side on the back of the computer.

Features

Built-in microphone

The internal microphone operates independently from all other audio input ports and is always available. The internal microphone supports recording at bit depths of 16, 20, or 24 bits per sample and at sample rates of 44.1 kHz, 48 kHz, or 96 kHz. Audio recorded from the microphone is presented as a stereo data stream with the same data on both the left and right channels. The microphone gain can be adjusted from -16 dB to +30 dB.

Built-in iSight camera

Video chat using iChat AV over a broadband connection, take pictures using Photo Booth or capture video through iMovie HD. The camera has an indicator light that glows when the iSight camera is in use.

Slot-loading optical disc drive

The SuperDrive can read CD-ROM, photo CD, audio, and DVD discs. It can write to CD-R, CD-RW, DVD±R, DVD±RW, and DVD±R Double-Layer (DL) discs.

Built-in infrared (IR) receiver for Apple Remote

The infrared-based Apple Remote works with the built-in IR receiver for use with Front Row to access DVD Player, iPhoto, iTunes, and QuickTime Player.

I/O ports

Apple Mini-DVI video output port

Using the Apple Mini-DVI video output port, you can mirror video or extend the size of the Mac OS X desktop (extended desktop mode) with a compatible DVI (Digital Visual Interface) display or VGA (Video Graphics Display) or projector using the appropriate Apple Mini-DVI adapter:

- For DVI displays, use the Apple Mini-DVI to DVI Adapter (M9321G/A).
- For VGA displays or projectors use the Apple Mini-DVI to VGA Display Adapter (M9320G/A).
- For televisions, projectors or VCRs that use S-video or composite video connectors, use the Apple Mini-DVI to Video Adapter (M9319G/A).

Video mirroring allows you to see the same image that is on the iMac (Mid 2007) flat-panel display, on an external monitor, television or projector.

Extended desktop mode allows you to connect an external display and use that area in addition to the built-in display for your desktop.

Ethernet port (10/100/1000 Base-T)

The iMac (Mid 2007) has a built in Ethernet port for 10Base-T/UTP, 100Base-TX and 1000Base-T Gigabit operation. The iMac (Mid 2007) computer can be connected to an Ethernet cable from a cable or DSL modem, hub, switch, or router, or to another Macintosh computer.

The connected device can be either a 10Base-T, 100Base-T or 1000Base-T device; the port automatically detects which type of device is connected. You don't have to use an Ethernet crossover cable to connect to other Ethernet devices.

Five USB (Universal Serial Bus) 2.0 ports

The back of the iMac (Mid 2007) has a total of three USB 2.0-compliant ports. You can connect both USB 2.0- and USB 1.1-compliant devices to these ports. The USB 2.0 ports support both low-speed, full-speed and high-speed data transfers, at up to 1.5 megabits per second (Mbit/s), 12 Mbit/s, and 480 Mbit/s respectively.

The aluminum Apple keyboard contains a USB hub with two high-speed USB 2.0 ports.

All the USB ports use USB Type A connectors, which have four pins each.

Audio line input/optical digital audio input port

Line input

The analog line input operates independently from all other audio input ports and is always available. The line input supports recording at bit depths of 16, 20, or 24 bits per sample and at sample rates of 44.1 kHz, 48 kHz, or 96 kHz. Audio recorded from the line input is presented as a stereo data stream. The line input gain can be adjusted from -16 dB to +30 dB.

During input of a 1 kHz, 1 VRMS (-3 dBFS) sine wave (44.1 kHz input sample rate, 24-bit sample depth, 0.0 dB input gain, no weighting) the audio line input has the following nominal specifications:

- Jack type: 3.5 mm (1/8-inch) stereo
- Maximum input voltage: 3 VRMS (+11.8 dBu)
- Minimum voltage input for full scale output: 63 mVRMS (-21.5 dBu) at input gain = +30 dB
- Input impedance: > 20 kilohm
- Frequency response: 20 Hz to 20 kHz, +0.5 dB/-3 dB
- Signal-to-noise ratio (SNR): >90 dB
- Total harmonic distortion + noise (THD+N): <-85 dB (0.006%)
- Channel separation: > 85 dB

Optical digital input

The digital audio input has the following electrical characteristics (nominal specifications), based on input of a 1 kHz sine wave at 0 dBFS input level, 24-bit sample depth, and 44.1 kHz sample rate (unless otherwise specified below):

- FSI – input sample rates: 44.1 kHz, 48 kHz, or 96 kHz
- Bits per sample: 16, 20, or 24
- Signal-to-noise ratio (SNR): >130 dB
- Total harmonic distortion + noise (THD+N): <-130 dB (0.0003%)

Sound output/digital audio output port

Line/Headphone output

The headphone output is automatically selected for audio output if no external S/PDIF optical digital output device is detected. The headphone output supports a stereo data stream at bit depths of 16, 20, or 24 bits per sample and at sample rates of 44.1 kHz, 48 kHz, or 96 kHz. The headphone output volume can be adjusted from 0.0 dB to -64 dB.

During playback of a 1 kHz sine wave at -3 dBFS voltage level, 24-bit sample depth, 44.1 kHz output sample rate, 100 k load (unless otherwise specified) the audio output has the following nominal specifications:

- Jack type: 3.5 mm (1/8-inch) stereo combo
- Maximum output voltage: 1.6 VRMS (+6.3 dBu)
- Output impedance: <24 ohms
- Frequency response: 20 Hz to 20 kHz, +0.5 dB/-3 dB
- Signal-to-noise ratio (SNR): >90 dB
- Total harmonic distortion + noise (THD+N): <-80 dB (0.007%)
- Channel separation: >85 dB

S/PDIF optical digital output

The S/PDIF (Sony/Philips Digital Interface Format) optical digital output is automatically selected when an S/PDIF optical digital output device is detected on the external combination audio port. The S/PDIF optical digital output supports pulse-code modulation (PCM) and Arc Consistency Algorithm #3 (AC-3) audio formats with the following stereo data stream characteristics:

- PCM: 16, 20, or 24 bits per sample at sample rates of 44.1 kHz, 48 kHz, or 96 kHz

- AC-3: 16 bits per sample at sample rates of 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, 176.4 kHz, or 192 kHz

The S/PDIF optical output channel status conforms to International Electrotechnical Commission (IEC) 60958-3 consumer mode digital audio.

During playback of a 1 kHz sine wave (S/PDIF output format at 0 dBFS output level, 44.1 kHz sample rate, 24-bit sample depth, unless otherwise specified) the digital audio output has the following nominal specifications:

- Jack type: 3.5 mm (1/8-inch) stereo combo
- Digital audio signal-to-noise ratio (SNR): >130 dB
- Digital audio total harmonic distortion + noise (THD+N): <-130 dB (0.00003%)

One FireWire 400 and one FireWire 800 port

The iMac provides one FireWire 400 port and one FireWire 800 port supported by an Open Host Controller Interface (OHCI) FireWire controller with a FireWire 800 PHY (Physical Layer).

The FireWire 400 port supports Institute of Electrical and Electronics Engineers (IEEE) 1394a with a maximum data rate of 400 Mbps (50 MBps). The FireWire 800 port supports IEEE 1394b with a maximum data rate of 800 Mbps (100 MBps).

The iMac (Mid 2007) supports 7 W for each port, for a total of 14 W.

The iMac (Mid 2007) computer supports Target Disk Mode (TDM).

Apple Remote Desktop: Why features may be grayed out in the Admin application

This article has been archived and is no longer updated by Apple.

When features are unavailable (grayed out or dimmed) in the Remote Desktop Admin application, the application is probably being run in Non-administrator Access or User Mode.

User Mode was introduced in Remote Desktop 2.0.

Non-administrator Access or User Mode is activated when a non-administrative user opens Remote Desktop to administer Apple Remote Desktop client computers. The administrator of the computer with Remote Desktop Admin installed can choose which features and tasks are available to non-administrator users.

See the Apple Remote Desktop Admin Guide for more information.

About the Mac OS X 10.4.11 Update

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.11 Update updates Mac OS X Tiger (versions 10.4 through 10.4.10) to version 10.4.11.

Important: Please read before installing

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- It is recommended that you backup your computer prior to installing any updates.
- If issues occur during installation--for example, Software Update quits unexpectedly--please see this article.

Installation

To update to Mac OS X 10.4.11, use Software Update or the standalone installer. You only need to use one of these methods to update your computer.

Software Update

Software Update, located in the Apple menu, will automatically check for the latest Apple software using the Internet. (Software Update might have linked you to this article to learn more about the update.) If your computer is not up to date, software updates for your computer will appear that you can install. Note that an update's size may vary from computer to computer when installed using Software Update. Also, some updates must be installed prior to others, so you should run Software Update more than once to make sure you have all available updates.

Standalone installer

Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. These versions of the standalone installer are available from Apple Downloads.

- The delta update for PowerPC-based Macs updates Mac OS X 10.4.10 (PowerPC) to 10.4.11.
- The delta update for Intel-based Macs updates Mac OS X 10.4.10 (Intel) to 10.4.11.
- The combo update for PowerPC-based Macs updates Mac OS X (PowerPC) 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, 10.4.7, 10.4.8, 10.4.9, or 10.4.10 to 10.4.11.
- The combo update for Intel-based Macs updates Mac OS X (Intel) 10.4.6, 10.4.7, 10.4.8, 10.4.9, or 10.4.10 to 10.4.11.

What's included?

The following modifications are included in this update:

Improvement	Platform	Category
Includes Safari 3	PowerPC, Intel	Internet
Adds RAW image decoding support for the following cameras: Panasonic Lumix DMC-FZ50, Leica V-Lux 1, Olympus E-400, Olympus EVOLT E410, Olympus EVOLT E510, Canon EOS 40D	PowerPC, Intel	Third-party
Improves compatibility when using OpenType fonts in QuarkXPress	PowerPC, Intel	Third-party
Improves reliability when running VMWARE's Fusion	Intel	Third-party
Improves support for using Image Capture to import pictures taken on your iPhone	PowerPC, Intel	iPhone
Improves syncing between iPhone and Yahoo! address books	PowerPC, Intel	iPhone
Addresses an issue copying files from a Mac OS 9 AFP sharepoint	PowerPC, Intel	Networking
Improved reliability advertising an AFP sharepoint over Bonjour	PowerPC, Intel	Networking

Addresses an issue which could prevent the use of port mapping when sharing your Mac's internet connection	PowerPC, Intel	Networking
Improves reliability when trying to authenticate to an AFP share using Kerberos	Intel	Networking
Improves compatibility with third-party wireless wide-area network devices	Intel	Networking
Improves reliability when mounting external USB hard drives.	Intel	USB
Adds support for Microsoft Presenter Mouse 8000	PowerPC, Intel	Bluetooth
Addresses an issue in which selecting two rows of album art within the iTunes artwork Screen Saver may cause System Preferences to unexpectedly quit	PowerPC, Intel	Other
Includes updated Daylight Saving Time information for customers in Australia, New Zealand, and the United States state of Indiana	PowerPC, Intel	Other
Allows the use of the special keys on aluminum Apple Keyboards to control Aperture slideshows	PowerPC, Intel	Other
Addresses an issue in which help content for some applications may be displayed in English when using the computer in another Mac OS X language	Intel	Other
Addresses issues with certain Apple Dashboard widgets: Unit Converter, Calculator, Stocks	PowerPC, Intel	Other
Includes recent Apple security updates	PowerPC, Intel	Other

Combo updates: The combo update delivers many improvements. It includes modifications delivered above as well as these previous Mac OS X 10.4.x updates.

- For PowerPC only - 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6
- For PowerPC and Intel - 10.4.7, 10.4.8, 10.4.9, or 10.4.10

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About the Mac OS X Server 10.4.11 Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server 10.4.x to version 10.4.11. This update is available as either a "combo" or "delta" update installer, for either PowerPC-only or Universal Mac OS X Server 10.4.x systems, and can be obtained via Software Update or standalone installer (manual download).

Important: Read before installing

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- It is recommended that you backup your system prior to installing any updates.
- If issues occur during installation--for example, Software Update quits unexpectedly--please see this article.

Installation

To update your Mac to Mac OS X Server 10.4.11, use Software Update or the standalone installer. You only need to use one of these methods to update your computer.

Software Update

Software Update, located in the **Apple** menu, will automatically check for the latest Apple software using the Internet. (Software Update might have linked you to this article to learn more about the update.) If your computer is not up to date, software updates for your computer will appear that you can install. Note that an update's size may vary from computer to computer when installed using Software Update. Also, some updates must be installed prior to others, so you should run Software Update more than once to make sure you have all available updates.

Standalone installer

Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once. These versions of the standalone installer are available from Apple Support Downloads:

- The delta update for PowerPC updates Mac OS X Server 10.4.10 (PowerPC) to 10.4.11.
- The delta update for Intel-based or PowerPC-based Macs updates Mac OS X Server 10.4.10 (Universal) to 10.4.11.
- The combo update installer for PowerPC updates Mac OS X Server (PowerPC) 10.4, 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, 10.4.7, 10.4.8, 10.4.9 or 10.4.10 to 10.4.11.
- The combo update for Intel-based or PowerPC-based Macs (called the "Universal Update") updates any version of Mac OS X Server 10.4.x (Universal) to version 10.4.11 on PowerPC-based and Intel-based Macs.

What's included?

The following modifications are included in this update (each applies to both PowerPC and Intel platforms unless otherwise noted):

Improvement	Category
Copying files over AFP from Mac OS 9 computers	AFP
Membership issues when users are in more than 16 groups	User management
Correct handling of the FTP LIST command	Networking
High availability failover between Intel and PowerPC servers	Networking
Registering servers on the local network with Bonjour	Networking
Proper handling of aliases on UFS and Xsan volumes	Filesystems
Setting ACL permissions when using chmod	Filesystems
Avoiding possible memory panics in 2GB and 4GB RAM configurations	Other
Time zone changes for 2007	Other
Searching for files over AFP from Mac OS 9 computers (Intel-based servers only)	AFP
Recent Apple security updates.	Other

Combo updates: The combo updaters deliver many improvements, including modifications detailed above as well as those in previous Mac OS X Server 10.4.x updates:

- (For PowerPC) 10.4.1, 10.4.2, 10.4.3, 10.4.4, 10.4.5, 10.4.6, 10.4.7, 10.4.8, 10.4.9 and 10.4.10
- (For Universal) 10.4.8, 10.4.9 and 10.4.10

iMac (Mid 2007): Some fonts may appear incorrectly rendered

This article has been archived and is no longer updated by Apple.

Issue or symptom

You may notice slight rendering differences with some fonts on iMac (Mid 2007) computers running Mac OS X 10.4.10. Text may appear offset or left-justified in applications such as iPhoto or in some Dashboard widgets. In some cases, the font may appear less smooth.

Solution

To address the issue:

1. Log in with an administrator account (or a user account that allows you to install software, make changes, and so on).
2. Open the Terminal application from Applications/Utilities.
3. Cut-and-paste (or carefully type) the following text at the prompt:
   ```
   sudo rm -r /Library/Caches/com.apple.ATS
   ```
4. Press the 'Enter' key.
5. When prompted for your password, enter the password you use to login (or install software) and press the 'Enter' key again.
6. Close the Terminal application and restart the computer. The fonts should now look properly rendered.

Mac OS X 10.5: About syncing contact photos on a Samsung D600 phone

This article has been archived and is no longer updated by Apple.

Issue or symptom

When syncing a Samsung D600 phone with Mac OS X 10.5 Leopard, you may notice that a photo that has been added to a contact on the phone itself may no longer appear after later adding (or changing) a picture for the same contact in the Mac OS X Address Book and syncing.

Solution

To avoid this issue, update any photos (or other contact information) in Address Book before syncing. Edit contact photos only on the phone itself.

iMac (24-inch Mid 2007): About the 2.8 GHz Intel Core 2 Extreme Processor

This article has been archived and is no longer updated by Apple.

You can order your iMac (24-inch Mid 2007) computer with a 2.8 GHz Intel Core 2 Extreme Processor. This is a dual-core, Intel processor with 4 MB shared L2 (level 2) cache, an 800 MHz frontside bus and it supports Intel 64 architecture.

Because this processor is a dual-core processor, the Apple System Profiler and About This Mac window identify the processor as "Intel Core 2 Duo."

For more information about the Intel Core 2 Extreme Processor, see Intel's product brief.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iSync: Modifying event durations on Motorola V180 and V220 phones in Mac OS X 10.5

This article has been archived and is no longer updated by Apple.

Issue or symptom

On a Motorola V180 or V220 phone, when editing the duration of events that were created in iCal in Mac OS X 10.4, then synced to the phone, the duration options may only be shown as 5 minutes (instead of 1 hour, for example).

Solution

To avoid this issue, make changes to the event duration time in iCal before syncing events to a Motorola V180 or V220 phone.

Some duration time options may no longer appear on the phone once the events have been synced from a Mac.

iTunes: Installation of some third-party software utilities may prevent disc burning

This article has been archived and is no longer updated by Apple.

Issue

Installation of DAEMON Tools or similar software utilities that provide "virtual" recorders may prevent CD burning functionality in iTunes or optical drives not being seen. In these cases, iTunes software may report "no recorders found on the system" or may prevent access to your optical drives where it is not seen by the computer system. iTunes may also indicate no burning software or burner is present. Uninstalling DAEMON Tools or other similar software utilities will not solve the issue.

Solution

Download and install the latest "SCSI Pass Through Direct" (SPTD) drivers. SPTD drivers are commercially available Device IO drivers and are used by virtual drive emulator software utilities such as DAEMON Tools and other vendors.

If you use Duplex Secure software ,the issue is resolved with an updated SPTD driver available here:
www.duplexsecure.com/downloads

If you use DAEMON Tools, download the latest version here:
www.disc-tools.com/download/daemon

If an update is not yet available for your software, uninstall DAEMON Tools or similar software utilities and then delete `sptd.sys` from `C:\\Windows\\System32\\Drivers` and then restart the computer.

Mac OS X Server 10.5: About using drives for network Time Machine backups

This article has been archived and is no longer updated by Apple.

With Mac OS X Server version 10.5, you can store network Time Machine backups on both internal and external hard drives. If you choose an external USB or FireWire drive for your backups, take care to prevent accidental disconnection during the backup process. Before physically disconnecting the drive, be sure eject the drive icon in the Finder. If the drive does not eject, wait until the backup is complete and try again.

iLife ‘05: System Requirements

This article has been archived and is no longer updated by Apple.

iLife ’05 requires the following:

Hardware

- Macintosh computer with a PowerPC G3 (400 MHz or faster), G4, or G5 processor.
- 600 MHz G3 or faster required for GarageBand.
- G4 or G5 required for GarageBand software instruments and advanced photo editing in iPhoto 5.
- 733 MHz G4 or faster required for iDVD.
- 1 GHz G4 or faster required to use HD features of iMovie HD
- 256 MB of RAM (512 MB recommended).
- 512 MB RAM required to use HD features of iMovie HD.
- 1024 x 768 display resolution.
- 4.3 GB of disk space required to install GarageBand, iTunes, iPhoto, iMovie and iDVD.
- 250 MB to install iTunes, iPhoto and iMovie only.

Software

- Mac OS X v10.3.4 or later.
- Mac OS X v10.3.6 or later required to use HD features of iMovie HD.
- Mac OS X v10.3.6 or later required to work with RAW photos (iPhoto 5).
- QuickTime 6.5.2 (included)
- DVD drive required to install GarageBand and iDVD.
- Apple SuperDrive (or 733 MHz G4 processor) required for iDVD.
- Burning DVDs requires an Apple SuperDrive DVD burner.

Published Date: Feb 20, 2012

iLife ‘04 system requirements

This article has been archived and is no longer updated by Apple.

iLife ’04 requires the following:

Hardware

- Macintosh computer with a PowerPC G3, G4 or G5 processor.
- 600 MHz G3 or faster required for GarageBand.
- G4 or faster required for GarageBand software instruments.
- 733 MHz G4 or faster required for iDVD.
- 256 MB of RAM required.
- 1024 x 768 display resolution.
- 4.3 GB of disk space required to install GarageBand, iTunes, iPhoto, iMovie and iDVD.
- 250 MB to install iTunes, iPhoto and iMovie only.

Software

- Mac OS X 10.2.6 or later.
- Mac OS X 10.2.8 or later recommended.
- QuickTime 6.4 or later (QuickTime 6.5 included).
- DVD drive required to install GarageBand and iDVD.
- Burning DVDs requires an Apple SuperDrive DVD burner.

Mac OS X Server 10.4: Create admin users in Server Monitor with Roman characters only

This article has been archived and is no longer updated by Apple.

Issue or symptom

Server Monitor authentication information created from two-byte characters will appear garbled and authentication will not work. Two-byte characters are commonly used in Japanese, Chinese, and Korean fonts.

Solution

When creating administration users for Server Monitor, only use Roman characters for the username and password.

AppleShare: How Privileges are Stored

This article explains how Apple Share file sharing privilege are stored and how to move them to another computer.
This article has been archived and is no longer updated by Apple.
Two files are key to maintaining privileges on the file server, the Users & Groups Data File and the invisible AppleShare PDS files. This article explains how they work together.

AppleShare PDS and PDF files

Every user and group that you create is automatically assigned a unique ID number. Similarly, every folder has its own unique ID number. AppleShare uses these ID numbers--not the names of the Users, Groups, or Folders--to determine who has access to the various folders on the server.

Each volume on the server has a file that maintains the access privileges of the folders on that volume. For standard read/write volumes, the file is stored at the root level of the volume. It is an invisible file called "AppleShare PDS". (PDS stands for Parallel Data Structure.)

The file is invisible so it won't be moved or renamed accidentally. If the file is moved or renamed, a new one will be created, and all privileges for that volume would be reset to the default (administrator is owner, no one else has privileges).

For read-only volumes such as CD's, the file that stores the privileges is located in the startup volume's System Folder: Preferences: AppleShare IP Preferences: Access Privileges folder; and will be called '<name of CD>.PDF', for example "AppleShare 6.0.PDF". For Personal File Sharing, these files are stored in the volume's System Folder: Preferences: File Sharing folder; and follow the same name structure. These PDF files work the same as the PDS files; if they are moved or renamed, a new one will be created, with default privileges.

Because the PDS files use unique numbers to identify the users, groups, and folders, the information in the PDS file will be invalid if these numbers change. As examples:

If you created a new Users & Groups data file, with all the same names and groups as the original, and substituted it for the original, privileges would be lost because the ID numbers would no longer match.

Similarly, if you did a Finder-copy of all your shared data to another hard drive, those copied folders would no longer have privileges (even if you also moved the PDS file over to the new volume), because the copied folders have different ID numbers associated with them. The information in the PDS file would be invalid, and privileges would be reset to the default.

Keeping U&G Data File and PDS files in sync

When File Services are starting up (and you see "this may take a few minutes" dialog), AppleShare is checking the information in the PDS and PDF files, and the data in the Users & Groups Data File, and the folders on the volume, to make sure all information is still valid.

Checking the privileges at start up can take some time, depending on the number of folders that need to be checked, and whether or not you're using explicit or inherited privileges at the server. See the section on Explicit vs. Inherited privileges for more details.

If it finds discrepancies, such as a single user no longer exists in the Users & Groups data file (such as what might happen if you restored that file from a backup), it will return that folder to default privileges. All privileges are lost when none of the information is found to be valid, which might happen if you do a clean system install, and don't restore your Users & Groups Data File into place before starting up the file server.

As a precaution when doing a clean install on the server, you can backup not only the Users & Groups Data File, but the PDS file for each volume on the server. If you should lose privileges at some point during the clean install process, you can restore the appropriate PDS backup file to its volume, and get privileges back.

In order to back up the PDS files, you must first make them visible. It is recommended if you have AppleShare IP 5 or 6 to use the AppleShare IP First Aid Tool. This utility will allow you to backup the Users & Groups Data File and AppleShare PDS File, it creates an AppleShare IP First Aid file that can be used for restoring. You can also make AppleShare PDS Files visible so they can be backed up with ASIP First Aid.

AppleShare IP First Aid 6.2 will work without AppleShare IP installed, allowing one to backup or move shared items and privileges from Mac to Mac. This is an unsupported utility and users should backup the AppleShare PDS and Users & Groups Data File in case difficulties do arise. You can get ASIP First Aid from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Without the AppleShare IP First Aid Tool this can be done with a disk utility, such as ResEdit, Norton Disk Editor or File Buddy. These applications will let you view the "Finder Info" for the files, and turn off the "invisible" flag. You'll also need to make sure that you keep them straight, so you know which PDS file goes with which volume. You might do that by placing the backup files in a folder named after the volume it came from.

Moving file sharing services to a different computer

If you want to move all file sharing services to a different computer, you'll need to move the Users & Groups Data File from the server to the new computer (replacing the one that's already there in the Preferences folder), restart, and make sure its recognized before you begin to move the shared data over.

When moving the shared data, you need to do so in a way that will preserve access privileges. Backing up and restoring with a utility like Retrospect is one way to go (AppleShare must be running during both the backup and restore process). Or you can use the Web & File Admin's "Duplicate Folder" command (which also maintains privileges) to copy all folders to be moved to an external disk, then just move that external disk over the new server. You could then use the "Duplicate Folder" command to move the data from the external to an internal disk again.

Troubleshooting Difficulties with File Sharing Starting Up

PDS files can sometimes get corrupted, which can have various symptoms, the most common is the server stays in "starting up" mode forever. Other symptoms might be that your share points keep getting unshared, or privileges don't change as expected.

This can happen with Personal File Sharing as well as with AppleShare File Servers. Difficulties starting up could also be an indication of corruption in the Users & Groups Data File, but this is not as common.

If you're experiencing such difficulties, keep the following in mind:

- Every volume on the desktop, except for floppy disks, is going to have an invisible PDS file on it, whether you share it or not.
- Check for available free space on every volume on desktop; if there's not enough free space on the disk to create the PDS file, the startup process may hang. A good rule of thumb is to keep 10% of a drive's capacity free. For a 1GB drive, this means 100MB should be free. This also helps accommodate temporary files that need to be created, such as spool files created when printing. The bare minimum for the PDS files is around 300K.
- If you have a current backup of the Users & Groups Data File, you can try swapping it out. This should cause you no loss of data, if you do it right (drag existing U&G Data File to desktop, drag backup to System Folder: Preferences, then restart the computer).
- If you suspect the fault is with PDS file corruption, check the PDF files (which hold the access privileges for any CD that's inserted into the server). With AppleShare IP, they're in the System Folder: Preferences: AppleShare IP Preferences: Access Privileges folder. With Personal File Sharing, they're in the System Folder: Preferences: File Sharing folder. Move those files to another location, and see if File Sharing starts up.
- If you're still having difficulty, try moving the AppleShare PDS files to another location one by one, to see if you can determine which file is causing the issue. Do so by making the files visible first, then moving the files to a folder, appropriately named to represent the volume the file came from. If you find out they're not the culprit after all, you can return them to their original location, and have your privileges restored.
- Another method is to simply unmount volumes from the desktop, then try starting up file sharing. Of course you can't do this with the startup disk.

Mac OS X 10.4.10: No sound input or output with Plantronics USB headset, microphone, or audio adapter

This article has been archived and is no longer updated by Apple.

Issue or symptom

After updating to Mac OS X 10.4.10, there may be no audio input or output from a Plantronics USB audio device (such as microphone or headset).

Solution

1. Make sure the device is connected to a USB port.
2. Open Audio MIDI Setup, which is in the Utilities folder within the Applications folder.
3. Make sure the Default Input pop-up menu (under System Settings) is set to the device.
4. Choose your device from the "Properties For" pop-up menu.
5. In the bottom right area of the window (under Audio Output), deselect the "Mute" checkbox.

This document will be updated as more information becomes available.

UPS does not appear in Energy Saver preferences

This article has been archived and is no longer updated by Apple.

Issue or symptom

An uninterruptible power supply (UPS) connected to your computer via USB may not appear in Energy Saver preferences until it is reset.

Solution

Follow these steps to reset the connection between the UPS and the computer:

1. Shut down the computer that the UPS is connected to.
2. Turn off the UPS and disconnect it from the AC outlet.
3. Leave the UPS disconnected and turned off for 2 or 3 minutes.
4. Connect the UPS to the AC outlet and computer again.
5. Start the computer up.
6. Verify that the UPS is recognized by Energy Saver preferences in System Preferences.

Final Cut Pro: Flip4Mac MXF components may cause unexpected quit

This article has been archived and is no longer updated by Apple.

Issue or symptom

With more than one Flip4Mac component installed, Final Cut Pro may unexpectedly quit when you open it in Mac OS X 10.4.10.

Solution

Delete or temporarily remove the following items:

- Library/Application Support/Final Cut Pro System Support/Plugins/Flip4Mac Editcam Plugin.bundle
- Library/Application Support/Final Cut Pro System Support/Plugins/Flip4Mac XDCAM Plugin.bundle
- Library/Application Support/Final Cut Pro System Support/Plugins/Flip4Mac Profile Plugin.bundle
- Library/Preference Panes/Flip4Mac Editcam.prefPane
- Library/Preference Panes/Flip4Mac XDCAM.prefPane
- Library/Preference Panes/Flip4Mac Profile.prefPane
- Library/Frameworks/Flip4MacPro.framework
- Library/QuickTime/Flip4Mac Editcam.component
- Library/QuickTime/Flip4Mac XDCAM.component
- Library/QuickTime/Flip4Mac Flip4Mac Profile.component

Final Cut Pro: Media-Managed projects with .stap files may not open on other computers

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you use the Send To Soundtrack feature in Final Cut Pro to create a .stap file (Soundtrack Pro Audio File Project) in a sequence, and that sequence is then copied using Media Manager, the resulting project may not open if it is moved to another computer.

If you try to open such a project on another computer, the project may not open and you may see this message:

> Searching for movie data in file "*filename*".

Solution

This document will be updated as more information becomes available.

About the security content of AirPort Extreme Base Station with 802.11n Firmware 7.2.1

This article has been archived and is no longer updated by Apple.

This document describes the security content of AirPort Extreme Base Station with 802.11n* Firmware 7.2.1. Firmware version 7.2.1 is installed into an AirPort Extreme Base Station with 802.11n* by running the AirPort Utility which is provided with the Base Station.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

AirPort Extreme Base Station with 802.11n* Firmware 7.2.1

- **AirPort Extreme Base Station with 802.11n***

  CVE-ID: CVE-2007-2242

  Available for: AirPort Extreme Base Station with 802.11n*

  Impact: Remote attackers may be able to adversely affect network performance

  Description: A design issue exists in the IPv6 protocol's handling of type 0 routing headers. Depending on network topology and capacity, the reception of specially crafted IPv6 packets may lead to a reduction in network bandwidth. This update addresses the issue by disabling the support for type 0 routing headers. This issue does not affect the Gigabit Ethernet version of AirPort Extreme Base Station with 802.11n*.

Installation note for Firmware version 7.2.1

Firmware version 7.2.1 is installed into an AirPort Extreme Base Station with 802.11n* by running the AirPort Utility which is provided with the Base Station.

(*) Based on an IEEE 802.11n draft specification

Soundtrack Pro: Clips with "/" as part of name may not be found when a multitrack project is loaded

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you load a multitrack project, Soundtrack Pro may not locate clips that have a slash ("/") character, also known as a solidus, as part of their name.

This can happen in situations in which a clip name includes a "/" character that is not preceded by a space. For example, a clip named "1/2 speed noise effect" would exhibit the issue, while one named "Half open / half closed door" would not.

Solution

Avoid slash characters when naming clips.

iDVD: Using .AVI Files in iDVD

This article has been archived and is no longer updated by Apple.

Issue or symptom

The .AVI (Audio Video Interleave) file format is a container format which may contain audio and video codecs (compression formats) not supported by QuickTime and therefore not supported in iDVD.

In some cases, you may encounter issues with audio or video when adding .AVI assets to an iDVD project, or when attempting to burn a DVD or create a disc image from that project.

Affected products

- iDVD

Solution

If you encounter audio or video issues, perform a general .AVI compatibility test for iDVD by first verifying the specific .AVI file being used is compatible with QuickTime Player.

If a project is not successful during burning or disc imaging, or if it is not visible or audible in iDVD Preview mode, use the following steps to determine if the assets themselves are supported or damaged:

1. Locate the .AVI file used in the iDVD project and open it in QuickTime Player.
2. From the Window menu, choose **Show Movie Inspector**.
3. Compare the codecs listed in the QuickTime Inspector window under the Format listing to the supported codecs listed on the official QuickTime Specifications page.
4. If the codecs are supported by QuickTime, play the file in its entirety in QuickTime Player while checking for any audio or video issues or artifacts.

Additional information

See "QuickTime: About Playing .AVI Files" for related information.

Audio hardware requirements for working with surround sound in pro audio applications

This article has been archived and is no longer updated by Apple.

If you plan to work with surround sound in Soundtrack Pro or Logic Pro, you'll need an audio interface with enough discrete outputs to accommodate the surround format you plan to work with. For example, if you work in 5.1, you'll need at least 6 outputs (for the 5 channels, plus the LFE channel).

The built-in optical hardware output included with some Macs cannot be used for monitoring surround with Logic Pro and Soundtrack Pro, because it requires a surround encoded audio stream, such as that output by a DVD. Neither Logic Pro nor Soundtrack Pro can playback surround encoded audio; they output discrete audio streams that can be encoded later in the authoring process by an application such as Compressor.

Mac OS X Server 10.5: How to override DHCP Client IDs

This article has been archived and is no longer updated by Apple.

The configurable option in Network System Preference to set a DHCP client ID can be overridden by the DHCP server in Mac OS X 10.5 Leopard Server.

Administrators may choose to configure DHCP Client IDs on their network client units in order to statically assign a DHCP provided IP Address to a computer in a specific location. Also, some ISPs required that a DHCP Client ID be configured in order for a DHCP lease to be acquired.

However, if a DHCP Client ID is improperly configured, the network client unit may not properly acquire a DHCP Address. To avoid this, configure your DHCP Server to override the DHCP Client ID settings on network client units.

To configure this feature, edit the server's DHCP configuration file, named "bootpd.conf" located in /private/etc:

1. If DHCP service is running, stop the service in Server Admin.
2. Using a text editor, add two lines near the end of the bootpd.conf file (which is in /private/etc). **Note:** The first line defines the dhcp_ignore_client_identifier key, and the second line enables the key with the boolean "true" value. The key and value should be inserted near the end of bootpd.conf but before last two preexisting lines of the file. The last 4 lines should look like this:

```
<key>dhcp_ignore_client_identifier</key>
<true/>
</dict>
</plist>
```

3. Enable DHCP service again.

After following these steps, as leases are renewed, DHCP Client IDs should be overridden. This should be evident by the absence of Client IDs in Server Admin > DHCP > Clients.

Xserve (Late 2006): Issue with waking from sleep

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some Xserve (Late 2006) computers with Mac OS X Server 10.4.10 and some PCI cards, may experience issues when waking from sleep. The computer may not wake properly and needs to be restarted.

Solution

Prevent the computer from sleeping by setting the Energy Saver system preference option for the computer, to **Never**. See this article for more details.

iWeb: Some movies on pages created by iWeb may not play in a browser

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some movies added to pages in iWeb may play properly before being published, but do not play properly once published and viewed with a browser.

Solution

This issue occurs with DivX-encoded movies. If you are creating your own movies, use H.264 to encode them. If you have a movie that is already encoded with DivX, you can do the following:

1. Open iTunes.
2. From the **File** menu, choose **Add to Library...** and add your movie.
3. Select the movie in your iTunes library.
4. From the **Advanced** menu, choose **Convert Selection for Apple TV**.
5. After iTunes has finished converting the movie, drag the new movie file from the iTunes library to your Desktop.
6. Replace the DivX-encoded movie in iWeb with the newly created copy from your Desktop.
7. Republish your site from iWeb.

Published Date: Feb 20, 2012

Xserve RAID: Internal IP address configuration

This article has been archived and is no longer updated by Apple.

Issue or symptom

RAID Admin may not allow you to configure the Xserve RAID with an IP address in the range 10.254.0.0 to 10.254.255.255 or use a network that conflicts with this range. For example, RAID Admin may not allow you to assign the Xserve RAID the IP address 10.0.0.1 with the subnet mask 255.0.0.0.

The Xserve RAID uses the network 10.254.0.0/16 (subnet mask 255.255.0.0) for internal communications. RAID Admin may not allow you to configure the network interfaces with any address in this range.

Solution

Use a network that does not conflict with 10.254.0.0/16 (subnet mask 255.255.0.0). For example, use 10.253.0.0/16 (subnet mask 255.255.0.0) network to avoid a conflict.

iSync: Syncing Sony Ericsson K700i and Z1010 contacts that use double-byte characters in Mac OS X 10.5

This article has been archived and is no longer updated by Apple.

Issue or symptom

You may notice that when synchronizing contacts with a Sony Ericsson K700i or Z1010 phone in Mac OS X 10.5, vCards which contain long entries with double-byte characters may not sync, or an alert message may appear. Double-byte characters are used in languages such as Japanese, Chinese, and Korean.

In some cases, these entries may be truncated in Address Book.

Solution

To avoid this issue with these phones, try reducing the number of characters used in contacts which contain double-byte characters.

iSync: Unable to sync with Sony Ericsson W900i phone after canceling a sync

This article has been archived and is no longer updated by Apple.

Issue or symptom

If a synchronization session is cancelled in iSync in Mac OS X 10.5, subsequent synchronization attempts may not complete, or may report an alert message.

This issue can occur if a synchronization session has been cancelled by clicking the "Cancel Now" button in iSync.

Solution

To begin synchronizing the Sony Ericsson W900i again with iSync, reset the phone device by powering it off and back on. Future synchronization attempts should work as expected.

iSync: Unable to sync with Nokia 6102 or 6103 phone after canceling a sync

This article has been archived and is no longer updated by Apple.

Issue or symptom

If a synchronization session is cancelled in iSync in Mac OS X 10.5 Leopard, you may notice the phone displays a "Quitting Sync"alert for an extended period of time.

Subsequent synchronization attempts may not compete, or may report a different alert message.

This issue can occur if a synchronization session has been cancelled by clicking the "Cancel Now" button in iSync.

Solution

To sync your Nokia 6102 or 6103 phone again, simply power it off and then back on. Future synchronization attempts should work as expected.

iSync: Syncing the postal address field with Nokia 6230i phones in Mac OS X 10.5

This article has been archived and is no longer updated by Apple.

Issue or symptom

Nokia 6230i phones support entering postal address fields (on the phone device) that include up to 126 characters. However, when synching this field via iSync, the first 60 characters only may be synchronized.

Solution

To avoid this phone issue, use 60 characters or less in the postal address field, or consider abbreviations.

Published Date: Feb 20, 2012

iSync: Syncing the birthday field with Samsung D900 phones in Mac OS X 10.5 Leopard

This article has been archived and is no longer updated by Apple.

Issue or symptom

Contacts initially created on a Samsung D900 phone and then synchronized using iSync may display a birthday of "January 1st, 1900" in Address Book.

Solution

By default, the Samsung D900 phone assigns an "empty" birthday to each new contact that's been created initially on the phone when synchronizing using iSync.

If you want a contact's birthday information to appear correctly, crate the contact in Address Book instead of on the phone device.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iMac: Frequently Asked Questions (1 of 2)

This article contains frequently asked questions (FAQ) the original iMac, introduced 1998-07, with answers to those questions. Later models may have different features and functionality which are documented in the Knowledge Base.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. What Is the difference between SDRAM and SGRAM?
2. What resolutions does the iMac built-in display support?
3. Does the USB keyboard perform the same way the ADB keyboard on other Macintosh and Power Macintosh computers performed?
4. Does the Apple USB mouse light up?
5. Can I attach an external display to iMac?
6. How fast is the CD-ROM drive in iMac?
7. Is the CD Drive just like the drive on other Macintosh computers?
8. How can I take care of the CD-ROM drive on iMac?

Question 1: What Is the difference between SDRAM and SGRAM?

Answer: iMac comes with two different types of memory: SO SDRAM and SO SGRAM. The former, SDRAM, is Synchronous Dynamic Random Access Memory, the memory iMac uses to run the Mac OS and applications. The latter, SGRAM, is Synchronous Graphic Random Access Memory, the memory iMac uses to display video. In both cases, the "SO" stands for "small outline."

iMac comes with 32MB of SO SDRAM (expandable to 128MB on the revision /A iMac, and 256MB on the revision /B iMac and the 266 megahertz iMac) and 2MB of SO SGRAM (expandable to 6MB). Adding more SDRAM allows you to run more applications. Increasing SGRAM (to either 4Mb or 6MB of video RAM) provides better 3D performance.

Note: Although revision /A iMac computers may work with larger capacity SO-DIMM's than stated, these larger sizes weren't available for official testing at the time of product development, and so therefore aren't included.

Question 2: What resolutions does the iMac built-in display support?

Answer: The 15-inch (13.8-inch, diagonal, viewable image size) built-in display supports three resolutions:

* 640x480 at 117Hz
* 800x600 at 95 Hz
* 1024x768 at 75Hz

The three resolutions/refresh rates have all been optimized for the iMac display and offer excellent performance and an extremely crisp image.

What do these numbers mean? The first set of numbers in each of the descriptions above stands for the resolution (the number of pixels displayed). For example, if you set the resolution to "640x480," the monitor displays an image that measures 640 pixels (horizontally) by 480 pixels (vertically). The second number indicates the refresh rate for that specific resolution. With faster refresh rates, you see less "flicker" and experience less fatigue--that is, you can work longer without your eyes getting tired.

Which is the best resolution/refresh rate? It depends on what you do. Try each one, and see which you like best. Keep in mind that the more pixels you choose to display, the smaller the resulting image will be onscreen. Let's say you have a spreadsheet open in AppleWorks (formerly ClarisWorks) and want to see as many columns and rows as possible. Setting the resolution to 1024x768 will allow you to see as much display real estate, as possible. If you're designing a graphic element for use on a web page, however, you may want to see as much detail as possible, so you may set the resolution to 640x480. Again, as you work with iMac, you'll find out what works best for you.

Question 3: Does the USB keyboard perform the same way the ADB keyboard on other Macintosh and Power Macintosh computers performed?

Answer: Although it's a USB--rather than an ADB--device and although it uses a USB cable and connects via the USB port, in every other way, its a keyboard just like any other Macintosh keyboard.

It has a power button, just like other Macintosh keyboards, that you can use to start up or shut down the computer.

Keyboard commands--like Command-Q for quit, Command-P for print, Command-W for close, etc--work the same way as they did on other Macintosh keyboards.

You still reset PRAM by holding down the Command, Option, "P," and "R" keys immediately after restarting the computer. You still tell the computer that you want to startup from a CD (rather than from the hard drive) by holding down the "C" key after a restart. And you still type

special characters and include diacritical marks the way you would with other Macintosh keyboards you may have used in the past.

Like other Macintosh keyboards, it includes a numeric keypad, a set of arrow (or cursor) keys, a set of function keys, and "Help," "Home," "Pg Up," and "Pg Dn" keys.

Quite distinctive, the translucent keyboard is designed to complement iMac. It includes two USB ports, one on either side, so you connect the mouse to either the left or right side of the keyboard.

For more information on the Keyboard that comes with iMac, be sure to check out the Mac OS Info Center. Just click on the icon for the "Mac OS Info Center." From the Main Menu, click on the following links to read more about the Keyboard and Mouse:

* Tell Me About My Computer
* Using Your Computer
* Working With the Keyboard and Mouse

Question 4: Does the Apple USB mouse light up?

Answer: No, the original round USB mouse does not light up.

Question 5: Can I attach an external display to iMac?
Answer: Apple designed the iMac with a very sharp, 15-inch internal display but did not include a video-out port that would allow customers to connect a second display.

More recent versions of the iMac do allow an external VGA type display to be connected to support video mirroring. Check your owners documentation to determine if your iMac has an external VGA port.

Question 6: How fast is the CD-ROM drive in iMac?

Answer: The 24x-speed CD-ROM Drive in iMac has the following specifications:

Disc Speed

* Up to 24X (twenty-four-times speed)

Disc Diameters Supported

* 120 millimeter (mm) (4.7 inches)
* 80 mm (3.2 inches)

Data Capacity

* 656 megabytes (MB), Mode 1
* 748 MB, Mode 2

Modes Supported

* Audio CD
* CD-ROM: Modes 1 and 2
* Photo CD: Single session and multisession
* Video CD
* CD-ROM XA (Mode 2, Form 1 and Form 2)
* CD-I (Mode 2, Form 1 and Form 2)
* CD-I Ready
* CD-Bridge
* CD-WO
* Enhanced Music CD (CD Plus)
* CD-RW

Laser

* Type: Semiconductor laser GaAlAs
* Wavelength: 780 nanometers (nm)
* Output power: 0.6 milliwatts (mW)
* Beam divergence: 53.4* +/- 1.

Question 7: Is the CD drive just like the drive on other Macintosh computers?

Answer: In functionality and performance, the 24x-speed (maximum) CD-ROM drive in iMac offers the same high level of quality that customers find in other Power Macintosh desktop computers and supports all of the modes listed above.

There are, however, see a couple of differences when you open the tray and insert a compact disc.

First Minor Difference. On iMac, the CD tray is spring activated rather than motorized. What does that mean? With drives in other Power Macintosh computers you may have used in the past, when you hit the button to eject the CD tray, you activated a small motor that opened the tray, completely extending it. In iMac, when you hit the button to eject the CD tray, you engage a spring-activated mechanism that pops the door open halfway. To open the tray completely, you gently pull the tray out until it's completely open.

Second Minor Difference. The CD tray incorporates a tiny spindle. The spindle, like the spindle found in many portable CD-ROM players, includes small tabs that are designed to hold the CD-ROM disc securely in position. So, instead of just dropping the CD-ROM disc into place on the tray (as you did on other Power Macintosh computers), on iMac, you'll need to:

* Place the center hole of the CD-ROM disc over the center spindle on the tray, with the disc label facing up.
* Place the hole in the center of the disc directly over the spindle, straddle your index and middle fingers over the hole, and press down until you feel the disc snap into place.
* Spin the disc once (to make certain that the disc is laying flat) before closing the tray.

Question 8: How can I take care of the CD-ROM drive on iMac?

Answer: In caring for the 24x-speed CD-ROM drive, you should keep the following recommendations in mind as you use the drive:

* Position your computer so that when the tray opens, it doesn't bump into anything.
* Be sure to close the tray when you're not using it.
* Do not leave the disc tray open. If dust gets on the lens of the CD-ROM drive, the drive may have problems reading your compact discs.
* Do not put anything (for instance, a cup) on top of the tray when it is open.
* Do not use excessive force when opening the tray.
* Do not touch the lens on the tray with your fingers.
* Do not wipe the lens with a paper towel or other abrasive surface. If you need to clean the lens, see an Apple-authorized service provider for a lens cleaner.
* Keep your computer equipment away from any source of liquid (such as wash basins, bathtubs, and shower stalls). If you drink coffee or other beverages while you're at your computer, take care not to spill.
* Avoid exposing your equipment to damp or wet weather. If your system is near a window, be sure the window is closed in rainy weather.

When you handle CD-ROM discs, you should also remember to:

* Hold a disc by the edges or by one edge and the center hole. Do not touch the data surface of the disc (the side without the label).
* To clean discs, wipe the shiny surface with a soft, damp cloth, working in straight lines from center to edge. Do not use any form of cleaning agent.
* To avoid damage to your discs, keep these points in mind:

- Do not exposed discs to direct sunlight
- Do not spill liquids on CD-ROM discs.
- Do not scratch CD-ROM discs
- Do not write on the discs
- Do not put tape on the discs
- Do not get dust on discs

Mac OS X: Adjusting Date & Time for New Zealand‘s late 2007 Daylight Saving Time changes

This article has been archived and is no longer updated by Apple.

In the second half of 2007, New Zealand began observing 27 weeks of Daylight Saving Time each summer. These new Daylight Saving Time rules are included in Mac OS X 10.4.11 and Mac OS X 10.5 Leopard.

Published Date: Feb 20, 2012

iMac: Frequently Asked Questions (2 of 2)

This article contains frequently asked questions (FAQ) the original iMac, introduced 1998-07, with answers to those questions. Later models may have different features and functionality which are documented in the Knowledge Base.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Is There a Way I Can Secure iMac to a Desktop?
2. Can I Attach External Devices to iMac?
3. Apple's Data Sheet for iMac Says that it Comes with "Built-in Stereo Speakers with SRS Sound." What is that?
4. Can I Get On-Site Service if I Need to Have iMac Repaired?

Question 1: Is There a Way I Can Secure iMac to a Desktop?

Answer: Yes. You can safeguard iMac by purchasing a locking cable kit. You can attach one end of the cable to your desk (or other solid fixture), and you can attach the other end to iMac, threading the cable through the built-in handle on the back of the computer.

Question 2: Can I Attach External Devices to iMac?

Answer: iMac offers a number of ways you can attach external devices.

For example, iMac has sound input and output ports (or "jacks") you can use to connect such audio equipment as tape decks or audio CD players, external speakers, and microphones. If you like to listen to music while you work on iMac, but you don't want to disturb other people, you also have two headphone jacks right on the front of iMac to use.

You can connect other types of external devices--like floppy disk drives, hard drives, printers, scanners, modems, digital cameras, etc.--to one of the Universal Serial Bus (USB) ports. iMac, itself, comes with two such ports, and there are two additional ports on the USB Keyboard that comes with iMac.

Finally, if you're using iMac in a network environment and want to send a file to the LaserWriter down the hall, you can use the built-in 10/100 BASE-T Ethernet port to connect to the Ethernet network in your office.

Question 3: Apple's Data Sheet for iMac Says that it Comes with "Built-in Stereo Speakers with SRS Sound." What is that?

Answer: Sound Retrieval System (or SRS) sound is proprietary technology used to enhance the sound you hear on iMac. Apple has licensed this technology from SRS Labs, including it in quite a number of computers prior to iMac. According to SRS Labs, SRS differs from stereo and other sound expansion techniques because it is based on the human hearing system. Our ears are complex instruments that allow us to hear in three dimensions.

Microphones and traditional stereo playback systems only produce flat, two dimensional sound images which are somewhat limited compared to "real live sound." SRS compensates for these limitations by re-establishing the necessary information that allows us to hear in three dimensions. The results are incredible and startlingly close to real-life. For more information refer to http://www.srslabs.com/ . Follow the path to 3D sound.

Like many options on your iMac, SRS Sound can be enabled or disabled (turned on or off) without affecting anything other than the sound you hear from the built-in speakers. That is, it does not otherwise affect the computer's usability, compatibility or performance.

Try it both ways, and see which you prefer.

Question 4: Can I Get On-Site Service if I Need to Have iMac Repaired?

Answer: Yes.

All iMac computers are covered by Apple's One-Year Limited Product Warranty. That warranty qualifies iMac for carry-in service whereby repairs are performed at the facility of an Apple Authorized Service Provider.

For customers who would prefer to have service performed at their own location, Apple provides a number of options.

AppleCare Protection Plan

For full details, refer to the **AppleCare Protection Plan** Web page.

Direct from an Authorized Apple Reseller

Many Authorized Apple resellers offer their own service options, so if you're interested in an on-site service option for iMac, contact an Authorized Apple reseller in your area.

If you live in the US and would like to locate an Authorized Apple reseller in your area, call 1-800-538-9696 or visit Apple's web site at http://buy.apple.com. If you live in Canada, you can either call 1.800.665.2775 or visit Apple's web site at http://www.apple.ca/buy.

Mac OS X 10.4: How to use a PPPoE connection while maintaining Bonjour for local network devices

This article has been archived and is no longer updated by Apple.

If you use a PPPoE connection to your Internet service provider in Mac OS X 10.4, follow these steps if you wish to maintain Bonjour connections to your other local network devices while connected to your ISP, such as a network-based printer or another local Mac sharing music through iTunes.

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Network**.
3. From the "Show:" pop-up menu, choose "Network Port Configurations".
4. Click "New...".
5. From the "Port:" pop-up menu, choose the same network port you are using for your PPPoE connection.
6. Name the new port the name in the "Port:" pop up menu and append DHCP at the end, for example "Built-in Ethernet DHCP".
7. From the "Show:" pop-up menu, choose the new port you have just created.
8. Click the TCP/IP tab.
9. Make sure that the value for the "Configure IPv4" pop-up menu is "Using DHCP".

This will allow your Mac to establish your PPPoE client connection to your ISP and continue to have local DHCP addressing to communicate to your local network devices.

USB 1.1: FAQ (1 of 4)

This article contains frequently asked questions (FAQ) regarding USB, with answers to those questions. Additional articles are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. What is USB 1.1?
2. How fast is USB 1.1 compared to other connection methods?
3. What is a USB hub?

Question 1: What is USB 1.1?

Answer: Universal Serial Bus (or USB for short) is an industry standard for connecting peripheral devices to personal computers. Apple is adopting USB in its products for a variety of reasons:

- it's an industry standard, so there will be a wide variety of solutions available to Apple customers
- it offers the true plug-and-play simplicity our customers expect from Apple products
- it's fast, offering data transfer rates of up to 12Mbps
- it can support up to 127 devices!
- it features hot plug and hot unplug--that is, you don't have to shut down iMac to connect a new or disconnect an existing USB device

As well as USB 1.1, as described above, USB 2.0 is a newer industry standard that allows for data transfer rates of up to 480Mbps. The data in this article is for USB 1.1.

Question 2: How Fast is USB 1.1 Compared to Other Connection Methods?

Answer: USB offers data transfer rates of up to 12Mbps. This compares very favorably to other Apple connection methods:

Connection Method	Data Transfer Rate	Used For
ADB	.01Mbps	Input devices like mice, keyboards, joysticks, etc.
Serial	.023Mbps--2Mbps	QuickDraw printers and telephony devices
USB	12Mbps	All of the above, and more
Ethernet	10/100/1000Mbps	Laser printers, network connections, etc.

Question 3: What is a USB hub?

Answer: A hub is a USB device that includes extra ports into which other USB device can be attached. Some hubs, like the keyboard, are bus powered, deriving their power from a source on the bus to which they are attached.

Others are self-powered. These come with an AC adapter that plugs into an electrical outlet and supplies power to the hub. There are several companies that sell hubs today.

Some self-powered hubs are likely to function solely as hubs, acting as a source of power and allowing you to plug several downstream devices into them. Other devices may include a built-in hub (like the Apple USB Keyboard) that serve a primary function but also provide other ports into which another device can be connected.

iPod game error message when launching different game types

This article has been archived and is no longer updated by Apple.

Issue or symptom

Trying to open a purchased iPod game (Tetris, Sudoku, or Ms. PAC-MAN for example) after playing a built-in game (Vortex, iQuiz, or Klondike) may result in the following message:

> "This game cannot be launched. Connect your iPod to iTunes and reinstall the game."

The same issue may occur if you play a purchased game first, then try to open a built-in iPod game.

Solution

Reset your iPod before opening a different type of game (built-in or purchased).

To prevent this issue from recurring, use iTunes to update your iPod software to version 1.0.1 or later. See Updating iPod if you need assistance.

USB 1.1: FAQ (2 of 4)

This article contains frequently asked questions (FAQ) regarding USB 1.1, with answers to those questions. Additional articles are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Does the USB 1.1 Keyboard perform the same way the ADB keyboard on other Macintosh and Power Macintosh computers performed?
2. Can I use the keyboard or mouse from my earlier Macintosh model with a USB 1.1-equipped Macintosh?
3. How can I use SCSI, ADB, LocalTalk, and other serial devices on a Macintosh without a serial port?
4. What type of cable does USB require?

Question 1: Does the USB 1.1 keyboard perform the same way the ADB keyboard on other Macintosh and Power Macintosh computers performed?

Answer: Although it's a USB--rather than an ADB--device and while it uses a USB cable and connects via the USB port, in every other way, it's a keyboard just like any other Macintosh keyboard.

Question 2: Can I use the keyboard or mouse from my earlier Macintosh model with a USB 1.1-equipped Macintosh?

Answer: Not directly. The keyboard and mouse that came with earlier models of Macintosh and Power Macintosh computers were Apple Desktop Bus (or ADB) devices and would require an adapter to connect to a USB equipped Macintosh.

Question 3: How can I use SCSI, ADB, LocalTalk, and other serial devices on a Macintosh without a serial port?

Answer: Beginning with iMac, Apple computers features support for USB, and many peripheral manufacturers are quickly transitioning to this new connection method. There are a multitude of adapters available for a variety of external devices. Check the Apple Products Guide at http://guide.apple.com for more information.

Question 4: What type of cable does USB require?

Answer: USB cables look slightly different from the cables you own now. Cables for all Macintosh peripheral devices have two identical connectors with five or more contacts. USB cables have new, universal connector cables: one side has a Type A plug and the other has a Type B plug.

The Type A plug connects to a host--like your iMac computer--or an upstream hub. The Type B plug connects to the USB device itself. These are the same cables that are used for USB devices for PC Compatible computers and UNIX systems.

USB 1.1: FAQ (3 of 4)

This article contains frequently asked questions (FAQ) regarding USB, with answers to those questions. Additional articles are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. What kinds of devices will I be able to connect to a USB 1.1-equipped Macintosh?
2. I just purchased a USB printer. How do I connect it to my computer?
3. What about support for USB audio devices?

Question 1: What kinds of devices will I be able to connect to a USB 1.1-equipped Macintosh?

Answer: Quite a few. USB can accommodate:

Input Devices

- Keyboards
- Mice
- Joysticks
- Graphics tablets

Storage Devices

- Floppy drives
- Hard drives
- Removable storage drives

Printing Devices

- Ink jet printers
- Laser printers

Imaging Devices

- Scanners
- Digital Cameras
- Displays

Telephony Devices

- Modems
- Speakerphone modems

Connectivity Devices

- Hubs

Question 2: I just purchased a USB printer. How do I connect it to my computer?

Answer: Your first step should be to check with the manual that came with your new printer.

The manual should explain how to install the driver used to communicate with the printer and any other software the printer needs. (By the way, with some USB devices, you won't have to install a driver because Apple includes some USB drivers with the Mac OS, and other devices don't need them.)

After installing the software (if necessary)

- Turn on the printer
- Plug its USB cable into one of computer's USB ports
- Open the Chooser and select the icon for your printer

Question 3: What about support for USB audio devices?

Answer: Apple has always provided excellent built-in sound-in and sound-out features in its systems and continues to do so. iMac continues this support by providing stereo surround sound speakers, a built-in microphone, and line-in and line-out audio connectors for external devices.

With the iMac (Slot Loading), USB audio is available. This includes speakers and microphones based on the USB interface. Additionally, Mac OS 9 introduces USB audio support for other USB equipped Power Macintosh computers.

Other USB FAQ's can be found in the following articles:

USB 1.1: FAQ (4 of 4)

This article contains frequently asked questions (FAQ) regarding USB 1.1, with answers to those questions. Additional articles are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Where can I find out about USB products available from third-party developers?
2. What kinds of error messages regarding USB devices might I see? What can I do about them?

Question 1: Where can I find out about USB Products available from Third-Party developers?

Answer: At the following addresses, among others:

- http://www.macsoftware.apple.com
- http://www.apple.com/usb
- http://guide.apple.com

As you shop for USB devices, you're likely to find many that will work with the Mac OS. If you want to find devices that have been specifically tested for compatibility with Mac OS, look for products that have both a USB logo and the Mac OS logo. If a USB product you're interested in has the USB logo only, check with the vendor manufacturing the product and ask about Mac OS compatibility before making your purchase.

Question 2: What kinds of error messages regarding USB devices might I see? What can I do about them?

Answer: If you encounter any difficulties with USB devices, they will be easily resolved. There are three kinds of error messages or dialog boxes Mac OS may use to alert you to a USB issue. These include:

- Not Enough Power to Function
- Not Enough Power for All Functions
- No Driver Found

Not Enough Power to Function

Mac OS will generate a Not Enough Power to Function message if:

- a device attempts to draw too much power from the USB bus.
- one or more devices plugged into a hub requires more power than is available.
- you've attached a self-powered device (like a printer or floppy drive) and forgot to plug it into an electrical outlet.

What to do? If you're using a self-powered device, check to see if the device is plugged into an electrical outlet. If not, try connecting the device directly to your iMac or to a port on a self-powered hub. If you're connecting the USB device to a self-powered hub, make sure the hub is plugged into an electrical outlet.

Not Enough Power For All Functions

Mac OS will generate a Not Enough Power for All Functions message if there is enough power to supply some but not all of the functionality the device is designed to provide.

What to do? As above, see if the USB device has its own power cord and, if it does, plug it into an electrical outlet. Otherwise, try plugging the cable for the USB device directly into to your iMac or to an available port on a self-powered hub. If you're connecting the USB device to a self-powered hub, make sure the hub is plugged into an electrical outlet.

No Driver Found

Mac OS will generate a No Driver Found message if a driver for the USB device you just connected cannot be found in the System Folder. If you get this message, you may have forgotten to install the software that came with the device, or you may have put the device driver (that is, the software that allows iMac to recognize and communicate with the USB device) in the wrong place in your System Folder.

What to do? Reinstall the software driver from the CD-ROM that came with the product, or download and install the driver from the product vendor's Web or FTP site on the Internet.

iPhoto: Edits performed in external editor not reflected in iPhoto

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you are using an external editor and do not access the external editor from iPhoto, the edits you make may not be reflected when viewing the image in iPhoto.

Solution

For best results, use iPhoto's built-in options for editing with an external editor.

Do not drag photos from the iPhoto window to the external editor's icon in the Finder or Dock. Instead, use iPhoto preferences to configure access to an external editor. This allows you to double-click or control-click an image in iPhoto to send it to the external application for editing.

Additional information

See iPhoto help for more information on accessing an external editor from iPhoto.

Published Date: Feb 20, 2012

iMac: Translucent Plastics FAQ

This article contains frequently asked questions (FAQ) regarding the iMac case, with answers to those questions.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. What kind of material is the iMac made of?
2. What color is iMac?
3. Is the iMac case durable?

Question 1: What kind of material is the iMac made of?

Answer: The iMac case is made from a translucent polycarbonate plastic.

Question 2: What color is iMac?

Answer: The original iMac was available in Ice and Bondi blue. In January 1999, Apple introduced iMacs in five new colors: Blueberry, Strawberry, Grape, Tangerine and Lime. In August, 2000, Apple introduced iMac computers in Indigo, Ruby, Sage, Graphite, and Snow. Refer to http://www.apple.com/imac for current colors.

Question 3: Is the iMac case durable?

Answer: Polycarbonate plastic is tough and should stand up to normal wear quite well. The iMac case should be at least as durable as the plastics used on other computer cases. Of course, you'll still have to exercise reasonable care. Don't scratch it with something sharp or rub it with something abrasive. Don't drop anything heavy on it, and don't drop iMac on the floor. Be careful with liquids, both hot and cold.

Both the User's Guide you receive with iMac and the html-based Mac OS Info Center on iMac's hard drive contains tips on keeping iMac clean. The latter, for example, advises the following:

Cleaning your equipment

- Use a damp, soft, lint-free cloth to clean the computer's exterior. Avoid getting moisture in any openings.
- Don't use aerosol sprays, solvents, or abrasives.

Important: Do not use any substance containing isopropyl alcohol or damage will result.

Cleaning the computer case

To clean the case, do the following:

1. Turn off the computer completely and then disconnect the power plug. (Pull the plug, not the cord.)

2. Wipe the surfaces lightly with a clean, soft, lint-free cloth.

Cleaning the screen

To clean the screen, dampen a clean, soft, lint-free cloth with water and wipe the screen. Do not spray liquid directly on the screen. Or you can use the packets (available in most office supply outlets) specifically for this purpose.

Keep in mind that while iMac's case is as durable as those on other computer equipment, scratches and other kinds of minor cosmetic damage may appear more readily because the plastics are translucent rather than opaque. So be especially careful with sharp objects, abrasive materials, or caustic substances.

Mac OS X 10.5: Changing your user account picture

This article has been archived and is no longer updated by Apple.

To change your user account picture in Mac OS X 10.5 Leopard:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Accounts**.
3. Click the current image (the image just left of the "Change Password" button). A menu appears in which you can quickly select a new picture or choose Edit Picture.

Mac OS X Server version 10.5: JBoss not included

This article has been archived and is no longer updated by Apple.

Mac OS X Server version 10.5 does not include the JBoss Application Server, which was included in Mac OS X Server 10.4.

JBoss is open source software and is available directly from the JBoss website.

iDisk Syncing: Color labels for folders do not sync in Mac OS X 10.4

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you are using iDisk Syncing, and choose a color label for a folder, the color label will not sync to other computers using iDisk Syncing, or appear on other computers that connect directly to your iDisk.

Solution

This is expected behavior. Color labels for files will sync.

This document will be updated as more information becomes available.

iSync: Deleting birthday fields with Sony Ericsson W800i phones and Mac OS X 10.5 Leopard

This article has been archived and is no longer updated by Apple.

Issue or symptom

When deleting the birthday field of contacts in the Mac OS X 10.5 Address Book, they may not correctly synchronize or still appear on some Sony Ericsson phones, such as the W800i.

Solution

On the phone, delete the birthday field.

iSync: Transferring events from iCal to Nokia E61/E62 phones

This article has been archived and is no longer updated by Apple.

Issue or symptom

Events created in iCal in Mac OS X 10.4 or 10.5 that include notes can synchronize with Nokia E61/E62 phones, but the note field's contents may not appear on the phone.

Solution

Create an event requiring a note entry on the phone device first, then synchronize. The resulting event in iCal will appear with notes.

iSync: Marking "To-Do‘s" with Nokia 7370 phones in Mac OS X 10.5, 10.4

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you have an iCal "To Do" that has been marked as complete, synced to a Nokia 7370 phone, then marked as "not completed" on the phone and synced again, the "due date" of the event may be changed to exactly two weeks into the future.

Solution

Apple has identified this as a limitation of the phone device.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iCal: To Do items synced with Nokia N70 phones remain "completed"

This article has been archived and is no longer updated by Apple.

Issue or symptom

Nokia N70 phones have a "Mark as not done" option for To Do items. If the "Mark as not done" phone option is used on a synced iCal To Do item whose status is "completed", the status will not change in iCal..

Solution

Change the "completed" status of To Do items in iCal instead of on the phone.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.5 Leopard: Using Apple Hardware Test after erasing your disk

This article has been archived and is no longer updated by Apple.

Some Intel-based Macs ship with Apple Hardware Test and Mac OS X 10.4.x preinstalled on the hard drive. If an Erase and Install installation of Mac OS X 10.5 Leopard is performed using a retail Leopard installation disc, Apple Hardware Test will be erased and not reinstalled on these Macs.

If you're in this situation and need to use Apple Hardware Test, simply start from the DVD that came with your computer (not the Leopard installation disc) while holding the "D" key. Apple Hardware Test will run from the DVD.

Mac OS X 10.4: Some Help content displays in English when primary language set to Japanese or Spanish

This article has been archived and is no longer updated by Apple.

Issue or symptom

In some cases, if the primary Mac OS X 10.4 language is set to Japanese or Spanish, some applications' Help content will appear in English instead of their specified language.

Solution

Download and install the Mac OS X 10.4.11 Update, or later.

If the issue persists after installing Mac OS X 10.4.11 or later

1. If the application's Help content continues to be displayed in English, close the affected application.
2. Click the Finder icon in the Dock, then choose **Home** from the **Go** menu.
3. Open the Library folder.
4. Open the Caches folder.
5. Locate the file named "com.apple.helpui folder" and move it to the Trash.
6. Close the Caches folder.
7. Back in the Library folder, open the Preferences folder.
8. Locate the file named "com.apple.helpviewer.plist" and move it to the Trash.
9. Locate the file named "com.apple.help.plist" and move it to the Trash.
10. Open the affected application again.

Final Cut Pro: Drop zone content is lost if project is moved to another computer

This article has been archived and is no longer updated by Apple.

Issue

If you use Master Templates in Final Cut Pro which utilize drop zones, the content that you place in those drop zones may be lost if you move the project to another computer. Using Media Manager to move the project will not prevent this issue.

Affected Products

- Final Cut Pro 6

Solution

After moving a project to another computer, it will be necessary to manually move and re-add the media for each drop zone.

This document will be updated as more information becomes available.

Mac OS X Server 10.4: "Client response doesn‘t match what we generated" log messages

This article has been archived and is no longer updated by Apple.

You may see entries such as the following in the system.log in Mac OS X Server:

```
/usr/sbin/PasswordService: client response doesn't match what we generated
```

This message means that user authentication did not work due to an incorrect password.

In most cases, this occurs when someone mistypes his or her password when logging in.

You can find more details in the Password Service Server log.

Note: If your Mac OS X client computers are set up to bind to LDAP using a computer name and password in Directory Access, and the password for that account has expired or been changed, you will see this message. To resolve it, you must unbind and rebind each client using the correct password.

Mac OS X 10.4, 10.5: "Show Log" dimmed in Disk Utility when started from the Mac OS X Install disc

This article has been archived and is no longer updated by Apple.

Issue or symptom

"Show Log" may be dimmed ("grayed out") in Disk Utility when started from the Mac OS X installation disk.

Solution

When you are started from the Mac OS X installation disc, Disk Utility actually sends its log messages to the Installer log. To view these messages, click the Installer window to bring it to the front, then choose **Installer Log** from the **Window** menu.

Note: In Mac OS X 10.5, quit Disk Utility to bring the Installer window to the front and view the Installer log.

Published Date: Feb 20, 2012

Some installer package files work with Mac OS X 10.5 only

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Installer application in Mac OS X 10.4 may close without any alert or installation attempt when using certain package files (files whose name ends with ".pkg").

Solution

If you can't install a certain package file in Mac OS X 10.4.x, make sure that the software you are attempting to install is compatible with the version of Mac OS X that you are using.

Some installer package files (files whose name ends with ".pkg") are intended for use with Mac OS X 10.5 only. Such package files may cause Installer to "silently quit" without installing, in Mac OS X 10.4.x or earlier.

Note: This issue does not affect installations of Mac OS X 10.5 itself "over" Mac OS X 10.4 or earlier because your Mac will start from the Mac OS X 10.5 disc before installing Leopard.

Mac OS X Server version 10.5: How to prevent Spotlight from indexing certain directories

This article has been archived and is no longer updated by Apple.

In Mac OS X Server version 10.5 Leopard, you have the ability to enable Spotlight indexing on sharepoints. Some sharepoints may contain directories that you want to exclude from indexing. These directories may include items such as print spools, mail storage and scratch files used in work-flow.

In order to prevent Spotlight from indexing a directory, append ".noindex" to the name. For example:

/Volumes/Server HD/Shared/**printer.noindex**/main-spool

In the example above, nothing below the printer.noidex directory will be indexed.

If appending ".noindex" to the path causes issues for a particular application, you can use a symbolic link to designate an appropriate path.

For example, if your printing application expects to find its spool at (/Volumes/Server HD/Shared/spool), you can create the ".noindex" directory and a symbolic link that will allow everything to function properly:

```
mkdir "/Volumes/Server HD/Shared/spool.noindex"
ln -s "/Volumes/Server HD/Shared/spool.noindex/"    "/Volumes/Server HD/spool"
```

`ls -l` would show the following:

```
lrwxr-xr-x   1 admin admin      13 Sep 25 12:58 spool -> spool.noindex
drwxr-xr-x  2 admin admin      68 Sep 25 12:58 spool.noindex
```

Spotlight will recognize that the "real" path is "spool.noindex" therefore, the "spool.noindex" directory will not be indexed, while the application will look for the "spool" path and work as expected.

Mac OS X: Startup key combination from paired Bluetooth keyboard may not work on a PowerPC-based Mac

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some startup key combinations, such as holding the C key during start up to start from a bootable disc or holding T to start in FireWire Target Disk mode, may not work on some Power-PC based Macs that uses a paired Bluetooth keyboard.

Solution

Use a USB keyboard (or built-in keyboard if your Mac has one) to perform the desired startup keyboard combination.

AppleShare IP 5.0.x: Using ARA 3.0 PS on same machine

This article contains information on using AppleShare IP 5.0.x and Apple Remote Access 3.0 Personal Server on the same computer.
This article has been archived and is no longer updated by Apple.
AppleShare IP 5.0 originally did not provide User fields for the ARA CallBack or Enable Dial-In features. If you install ARA Personal Server 3.0 and AppleShare IP 5.0 on the same computer, you should upgrade to AppleShare IP 5.0.2 or later.

Installation Order - ARA Personal Server has to be installed first. If not, current User information will not be imported into AppleShare IP 5.0.x's User list. Your ARA server will not work if installed after AppleShare IP 5.0.x.

ASIP 5.0.2/5.0.3 fully supports ARA 3.0 PS dial-in. However, it is not fully compatible with ARA CallBack. ARA CallBack works as follows in ASIP 5.0.2/5.0.3:

- ARA CallBack still works for users that were configured for call back in ARA before AppleShare IP was installed. However, after installing AppleShare IP, the 'call user back' button will be unchecked and the call back number will be dimmed. Call back is actually still active, although the window indicates otherwise.

- ARA CallBack will not work for users created after AppleShare IP was installed. However, Dial-in will still function.

- ARA CallBack will no longer work for users whose call back information was modified in AppleShare IP. However, Dial-in will still continue to function.

Workarounds:
1) Run ARA and AppleShare IP on separate computers
2) Configure ARA CallBack users before installing AppleShare IP.

Mac OS X 10.5: Parental Controls - "Can administer printers" should be set locally

This article has been archived and is no longer updated by Apple.

Parental Controls in Mac OS X 10.5 Leopard provides the ability to remotely administer managed user preferences. When remotely administering a computer, the "Can administer printers" option can be checked or unchecked but the changes will not apply on the remote computer. To enable or disable the option "Can administer printers", go to the remote computer itself and make the change using Parental Controls preferences on that computer.

Mac OS X 10.4, 10.5: VoiceOver manuals available in Braille

This article has been archived and is no longer updated by Apple.

Embossed Braille versions of the "VoiceOver Getting Started" manuals are available for $29.99 each by calling 1-800-APL-CARE (1 800 275 2273). Major Credit cards are accepted, and shipping is free worldwide.

The embossed manuals are available in grade 2 (contracted) Braille in US English only. Please specify which version you prefer when ordering: Mac OS X version 10.5 Leopard or Mac OS X version 10.4 Tiger.

You can request an electronic Braille (.BRF) version of this manual by sending an email accessibility@apple.com .

PDF versions of these manuals are also available for free download from (www.apple.com/accessibility/).

Mac OS X 10.4 or later: Finder may stop responding on logout with mounted network volumes

This article has been archived and is no longer updated by Apple.

Issue or symptom

If a wireless network's shared volume (disk) is mounted when you log out of Mac OS X 10.4 or later, the Finder may stop responding.

Solution

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Network**.
3. From the "Show" pop-up menu, select AirPort.
4. Click the Options button.
5. *Deselect* (uncheck) "Disconnect from wireless networks when I log out".
6. Click OK.
7. Close the Network preferences window and save the changes.

To avoid the issue, manually eject any mounted wireless volumes before logging out. Leave the "Disconnect from wireless networks when I log out" option deselected.

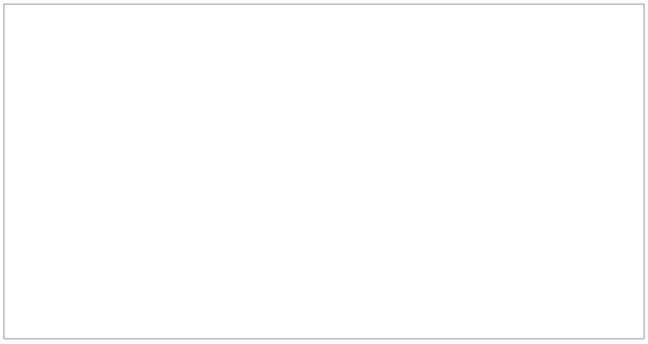
Update to iOS 12

Enjoy a faster and more responsive experience as well as fun new features, like Memoji and Camera Effects.

Get iOS 12



Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

AppleShare IP: Folders appear locked with AppleShare File Server running

If I am running AppleShare IP on my server, some of the folders appear locked. Even if I am at the server machine itself, lock icons appear next to the folder in the Finder and I can't move or rename the folder. These folders may or may not be inside of a Share point, but they are only locked when AppleShare is running. Why is AppleShare locking these folders?
This article has been archived and is no longer updated by Apple.
These folders have been set in AppleShare for "Can't Move, Rename, or Delete this folder." This is a setting in AppleShare Web & File Admin. If you open up the Disks and Share Points window in the Web & File Admin, navigate to the folder in question, and open up the privileges window for that folder, you will see a check box for "Can't Move, Rename, or Delete this folder." If you remove the check in that box, the locks will disappear.

The AppleShare IP Mail Folder is locked by default when the folder is first created. This is because the mail server depends on the precise name and location of that folder. If the folder is renamed or moved, the mail server will not see the mail database, and users may loose their mail as a result.

Macintosh: Difference Between Install CD and Restore CD

This article explains the difference between software CDs that come with many Macintosh computers.

This article has been archived and is no longer updated by Apple.
Many Macintosh computers come with CD-ROM discs: Software Install and Software Restore. These CDs contain similar software, but they provide two different functions.

Install

This disc allows customers to install separate software components. Customers may install the Mac OS, either through an easy or custom installation. Installers for utilities and bundled applications that come with the computer are also usually present.

Restore

This disc or discs allows customers to restore the Macintosh computer's software to its original configuration. This disc includes all of the software that came with the computer, including system software. Customers may choose to replace the software on their computer (at least the software that came with the computer), or they may erase the computer's hard disk-including any data files they may have saved and additional applications they may have installed.

After erasing the hard disk, the computer's software is restored to its original configuration.

Mac OS X Server version 10.5: About Kerberized NFS

This article has been archived and is no longer updated by Apple.

Secure NFS with Kerberos

Mac OS X 10.5 Leopard makes Kerberos security available for NFS. This article describes how to configure NFS exports and mounts to use Kerberos.

Without Kerberos, NFS exports and mounts use a standard form of user identification known as AUTH_SYS. In each NFS request sent to the server, the NFS client simply inserts the user's user and group IDs (UID and GID) and group list into a credential that the server uses to check access against the permissions of each directory and file in the exported filesystem. Since the user of the NFS mount is not required to authenticate when mounting, it is convenient to use, though it is also not very secure. It would be relatively easy for a rogue client or user to masquerade as another user.

An NFS filesystem that is exported and mounted with Kerberos security is much more secure. To mount and access the filesystem a user must have a valid Kerberos ticket obtained from the Kerberos KDC (Key Distribution Center), and this ticket is further validated by the server. The server must also have a valid Kerberos credential so that it can authenticate itself to the client; the security works in both directions. Furthermore, the NFS data that passes over the network between client and server can also be integrity protected to prevent unauthorized alteration or privacy protected to prevent disclosure to a malicious user on the network.

Like NFS itself, Kerberized NFS is an Internet standard. It is implemented by most operating systems and NFS vendors. Kerberized NFS can be used by mounts using NFS versions 2, 3 or 4 and over UDP or TCP connections.

Exporting with Kerberos

Before a filesystem can be NFS-exported with Kerberos, the server must be configured with NFS service principals in its Kerberos keytab file. This can be created in an Apple Open Directory environment using the sso_util utility (type `man sso_util(8)` in Terminal to learn more). Generally these will be created automatically when doing an authenticated binding to the Open Directory service. In other environments the Kerberos administrator can generate keys for the nfs principals and extract the appropriate keytabs using the tools for their Kerberos implementation.

When you set up a Mac OS X NFS server that will serve clients other than Mac OS X clients, you should limit the keys to only support single DES. For more information see this article.

On the server, you can verify that the Kerberos service principals for nfs are set up correctly with the klist command:

```
$ sudo klist -ke | grep nfs

6 nfs/server.company.com@OD.COMPANY.COM (ArcFour with HMAC/md5)

6 nfs/server.company.com@OD.COMPANY.COM (DES cbc mode with CRC-32)

6 nfs/server.company.com@OD.COMPANY.COM (Triple DES cbc mode with HMAC/sha1)

2 nfs/LKDC:SHA1.23A473C08D62474C23E1C2BDB2259CA587D58BB4@OD.COMPANY.COM (ArcFour with HMAC/md5)

2 nfs/LKDC:SHA1.23A473C08D62474C23E1C2BDB2259CA587D58BB4@OD.COMPANY.COM (DES cbc mode with CRC-32)

2 nfs/LKDC:SHA1.23A473C08D62474C23E1C2BDB2259CA587D58BB4@OD.COMPANY.COM (Triple DES cbc mode with HMAC/sha1)
```

Once the Kerberos keytab is set up, the filesystem can be exported using the NFS exports file (type `man exports(5)` in Terminal for more information). By default, an NFS filesystem is exported with standard AUTH_SYS security. For example, the following /etc/exports entry exports a filesystem with AUTH_SYS security and provides mount access to sub-directories:

```
/Volumes/data -alldirs
```

To export this filesystem with Kerberos, you must use the "sec=" option which takes a list of security flavors, separated by colons. The list is organized in preference order. Here is the same filesystem exported with Kerberos authentication:

```
/Volumes/data -alldirs -sec=krb5
```

The server can use Kerberos to provide additional services such as data integrity protection and data privacy. The following export has a security list that allows simple Kerberos authentication (krb5) (most preferred) or alternatively, Kerberos authentication with data protection (krb5i), or Kerberos authentication with data protection and data privacy (krb5p).

```
/Volumes/data -alldirs -sec=krb5:krb5i:krb5p
```

The server will allow the client to use any of the security flavors that appear in the list.

Migrating clients to Kerberos

When changing an export to use Kerberos, you may need a transition period to make sure that all the clients that mount that export are capable of using Kerberized NFS and that all users have Kerberos credentials registered with the KDC. You can continue to use standard AUTH_SYS security for those clients that still need it simply by adding "sys" to the preference list. For example:

```
/Volumes/data -alldirs -sec=krb5:sys
```

This entry exports the filesystem with Kerberos authentication preferred, but continues to allow non-Kerberized mounts. Once all the clients and users are capable of Kerberized mounts, you can remove the ":sys" from the export to make it fully secure.

Alternatively, you can selectively associate security with specific clients. For example, if just two clients are incapable of Kerberized mounts and must continue to use standard AUTH_SYS security, you can create an export specific to them:

```
/Volumes/data -alldirs -sec=krb5
/Volumes/data -alldirs -sec=sys client1 client2
```

Mounting with Kerberos

To successfully mount a Kerberized NFS filesystem you must have a valid Kerberos credential, or in Kerberos parlance, a TGT or "Ticket Granting Ticket." If the client is successfully bound to an Open Directory server that has your Kerberos credentials set up in its KDC, then the TGT will be obtained automatically when you log in. You can use the Kerberos klist command to check whether you have a TGT:

```
$ klist
Kerberos 5 ticket cache: 'API:1'
Default principal: john@OD.COMPANY.COM
Valid Starting  Expires    Service Principal
10/20/07 12:09:44  10/20/07 22:09:44 krbtgt/OD.COMPANY.COM@OD.COMPANY.COM
renew until 10/27/07 12:09:44
```

Or, if you have no TGT:

```
$ klist
klist: No Kerberos 5 tickets in credentials cache
```

Alternatively, you can use the /System/Library/CoreServices/Kerberos utility to display your Kerberos tickets.

Assuming you have a Kerberos TGT, you can then do the mount normally using either the mount command, or the automounter. For example:

```
$ mount server:/Volumes/data /mnt
```

Or use the automounter:

```
$ ls /net/server/Volumes/data
README.txt dir1 dir2
```

Once the mount is complete, you may notice that in addition to your Kerberos TGT you now have a ticket that provides access to your new NFS mount:

```
$ klist
Kerberos 5 ticket cache: 'API:1'
Default principal: john@OD.COMPANY.COM
Valid Starting Expires    Service Principal
09/20/07 12:09:44 09/20/07 22:09:44 krbtgt/OD.COMPANY.COM@OD.COMPANY.COM
renew until 09/27/07 12:09:44
09/20/07 14:13:53 09/20/07 22:09:44   nfs/server.company.com@OD.COMPANY.COM
```

```
renew until 09/27/07 12:09:44
```

Security mount option

Notice that you do not need to use any special mount options. The client will check the server's "sec=" list of security flavors associated with the export, and use the most preferred flavor that it allows.

However, there is a "sec=" mount option that can be used to mandate a specific security flavor. For example, if the server exports with "-sec=krb5:krb5i:krb5p" and you require a mount with data integrity protection, then you can select that using the "sec=" mount option:

```
$ mount -o sec=krb5i server:/Volumes/data /mnt
```

If the server doesn't support that flavor, the mount will not work. For example, if the server exports with just "-sec=krb5" then the mount will not work if you use the "sec=krb5i" option:

```
$ mount -o sec=krb5i server:/Volumes/data /mnt
  mount_nfs: can't access /Volumes/data: Authentication error
```

Security failover

It's possible that a Kerberized mount might not work. The issue might occur for a variety of reasons: The user may not have Kerberos credentials, or the server may not have a valid keytab or be misconfigured. If for any reason a Kerberized mount does not work, the NFS mount command then attempts a mount with standard AUTH_SYS security. This mount failover will succeed only if the export on the server allows the use of AUTH_SYS, for example:

```
/Volumes/data -alldirs -sec=krb5:sys
```

Failover is per-user; it could occur even on a successful mount. You, as a user with valid Kerberos credentials, may have performed the mount and have access to it, but another user without Kerberos credentials might log into your client and attempt to access the same mount. If the export is configured to allow failover to AUTH_SYS, then that user will get AUTH_SYS access, while you continue to use the filesystem with Kerberos credentials.

A server administrator should enable the failover to AUTH_SYS only to facilitate client migration to Kerberos. Once the migration is complete, the failover should be disabled by removing the option to use AUTH_SYS.

Error messages

If for some reason a Kerberized mount does not work, the mount command will most likely display "Authentication error" and nothing more. If a Kerberized automount does not work, the message may be just "Operation not permitted." These messages provide little clue as to the root cause of the issue. Fortunately, the gssd daemon, which sets up Kerberized mounts, logs more descriptive messages to the system log. For example, in /var/log/system.log:

```
gssd[5740]: nfs client Kerberos: server:/Volumes/data, uid=92 - Can't display user interface from this
environment
```

This message from gssd shows that the error originated from the NFS client. A server error would display "nfs server." The issue occurred while the user with uid=92 was trying to access the filesystem mounted from server:/Volumes/data. In this case, the error message is "Can't display user interface from this environment" which is expected when a user has no Kerberos credentials. In this case, the user with uid=92 has been denied access. Kerberos authentication is performed not only at mount time, but whenever a new user attempts to access the mount, so gssd messages may also be logged if the filesystem is successfully mounted, but access is subsequently denied to some user for lack of Kerberos authentication.

Superuser access

Some applications may attempt to use your Kerberized NFS mount as superuser with UID=0, either directly through a setuid executable or sudo, or indirectly via a system daemon.

It is common for the superuser not to have any Kerberos credentials, which would normally prevent any access to a Kerberized mount. Since superuser proxy access is common, the NFS client makes an exception and allows superuser to use the Kerberos credential of the user that mounted the filesystem. To the server, the access will appear to be coming from the user that did the mount, not superuser.

This substitution of credentials works only if superuser is attempting to access a Kerberized filesystem that is already mounted. Unless superuser is already set up with a Kerberos credential, it cannot mount a Kerberized filesystem from scratch. This may take some adjustment since historically, mounts could done only by superuser. A regular user can do NFS mounts as long as the directory being mounted on is owned by the user.

Kerberized NFS and Tickets

If you are a registered Kerberos user you authenticate with a new TGT automatically when you first log in, or when you re-authenticate through

screen lock. A TGT is effective only until its expiry time, though it will can be renewed up to a maximum renewable lifetime. For example a TGT displayed by the klist command shows output similar to this:

```
Valid Starting Expires    Service Principal

09/20/07 12:09:44 09/20/07 22:09:44 krbtgt/OD.COMPANY.COM@OD.COMPANY.COM
renew until 09/27/07 12:09:44
```

This TGT was issued at 12:09 and is valid for 10 hours. It can be renewed for up to a week. These expiry times and limits are set up by the Kerberos administrator with the intent of making users re-authenticate periodically to limit ticket exposure without being too burdensome.

When you do a Kerberized mount, the gssd daemon uses the TGT to obtain a ticket for the mount. The klist command will display this ticket also:

```
09/20/07 14:13:53 09/20/07 22:09:44   nfs/server.company.com@OD.COMPANY.COM
renew until 09/27/07 12:09:44
```

Once the mount is complete, the session key from the Kerberos ticket is cached with the mount and remains valid as long as the server continues to accept the ticket. There is no further interaction with Kerberos on the client unless the server restarts or rejects the ticket.

If the mount requires a new ticket, NFS notifies the gssd to renew the ticket with the your current TGT. This process is completely invisible to users and applications that use the mount.

If re-authentication is needed and there is no TGT available because you have logged out, further access to the mount by long-running processes initiated by you in the background will be rejected with an EAUTH error and gssd will log messages to the system log identifying the user and the mount.

Data integrity, privacy, and performance

Kerberos security comes in three flavors:

- **krb5** - Secure authentication
- **krb5i** - Secure authentication and data integrity
- **krb5p** - Secure authentication, data integrity, and privacy

A server administrator needs to choose the kind of security that the clients should use, keeping in mind that there is a performance overhead when using data integrity or privacy.

With krb5 security, the RPC header on each NFS request and reply is digitally signed. The overhead in generating and checking this digital signature is very small, so performance is not noticeably affected.

If krb5i security is used, the entire payload in every NFS request and reply is digitally signed and the signature is verified by the receiver. The overhead in computing and checking this digital signature is proportional to the size of the payload. Small metadata operations, such as listing small directories or obtaining file attributes generate small requests and replies, so performance will may not be noticeably affected. However, if you are copying large files to or from the server, the data may take almost twice as long to transfer.

The performance impact of krb5p security is even greater. Not only is the entire payload digitally signed, but the data is further processed to encrypt it before it is sent. The receiver must then decrypt the data before it can compute and check the digital signature. Again, the performance impact is proportional to the amount of data transferred. If you are copying files back and forth between client and server, it may take five times longer to transfer using krb5p.

Remote Desktop: Can only Observe and Control if user account has no password

This article has been archived and is no longer updated by Apple.

Remote Desktop will only allow you to control and observe a Mac if the ARD user has a blank password. All other tasks will not work.

The status will show "No Password" and will not appear in a 'ready' status.

To perform other tasks using Remote Desktop, specify a user who has a password configured when adding the computer in Remote Desktop Admin.

You may also use Directory-based authentication in this scenario. Refer to page 63 of the Remote Desktop 3.1 Admin Guide for more information about directory-based authentication.

Apple Keyboard (2007): Right Shift key doesn‘t work with Kotoeri shortcut

This article has been archived and is no longer updated by Apple.

Issue or symptom

The right Shift key on an aluminum Apple Keyboard (2007) does not work when using the Kotoeri shortcut (Option+Shift+Fn+F5) to switch to 'Romaji' input mode.

Solution

The keyboard functions as designed. Please use the **left** Shift key of the aluminum Apple Keyboard to use the Kotoeri shortcut to switch to 'Romaji' input mode.

About iMac Software Update 1.2.1 for Tiger

This article has been archived and is no longer updated by Apple.

Discussion

This update is for 20-inch and 24-inch aluminum iMac computers with 2.0, 2.4, or 2.8 GHz processors running Mac OS X Tiger.

It improves the performance and reliability of graphics-intensive games and applications and fixes an issue that some customers encountered when installing Mac OS X Leopard after applying iMac Software Update 1.2.

Mac OS X 10.5: Using iChat Backdrop Effects

This article has been archived and is no longer updated by Apple.

Backdrop Effects is a Mac OS X 10.5 Leopard iChat feature that "removes" the background of your video chat and replaces it with a picture of your choosing, leaving you in the foreground. It works much like a "green screen" used by actors in a Hollywood studio.

This works by taking a snapshot of the background when you are not chatting. Since the computer knows what the background is, parts of it can be replaced with images or movies. Since you were not part of the background when the snapshot happened, you will not be ignored, hence you or any other object will be able to move "on top of" the background.

Tips for using iChat Backdrop Effects

To avoid "holes" in your foreground image (in other words, in your image), make the background as uniform in color as possible, and make that color as different from colors in the foreground as possible. Your background image should not include color shades that match your clothing, hair, or skin tone. For example, if your Backdrop image is mostly a bright blue sky, and you are wearing a similarly bright blue shirt, "holes" may appear in your shirt where it overlaps the background sky.

If any part of the background moves after the detection, the moving objects will not be part of the background anymore. "Holes" will appear. You should pay attention to shadows that are part of the background but move when the user moves back in front of the camera. Make sure not to move your camera after the background snapshot takes place.

Reflective surfaces in the background should be avoided.

A dark room makes it harder for this effect to work. Make your area as well-lit as possible.

Note: You can press Command-Option-R to reset the background at any time in iChat.

Mac OS X Server version 10.5 Leopard: Do not enable SSL for wiki sites hosted by Apache 1.3

This article has been archived and is no longer updated by Apple.

Issue or symptom

When using Apache 1.3 on Mac OS X Server version 10.5 Leopard to host a website with the wiki service enabled, do not enable SSL for that site in Server Admin. If SSL is enabled in this configuration, links in dynamically generated page content will begin with "http://" instead of "https://" preventing proper functionality.

Solution

If you must use SSL with the wiki service, use the default Apache 2 Web Server. If you must use Apache 1.3, disable SSL for any sites hosting a wiki.

Mac OS X 10.5: About Kerberos in Mac OS X 10.5 clients

This article has been archived and is no longer updated by Apple.

Mac OS X 10.5 Leopard utilizes Kerberos to make it easier to share services with other Macs.

Kerberos is a "single sign on" technology. When you connect to a Mac that supports Kerberos, just like any Mac OS X 10.5 Mac, you are granted a "ticket" that permits you to continue to use services on that machine, without re-authenticating, until your ticket expires.

For example, consider two Mac OS X 10.5-based Macs, named "laptop" and "family". "Family" has screen sharing and file sharing turned on. If "laptop" connects to one of the shared folders on "family", "laptop" can subsequently connect to screen sharing on "family" without having to supply login credentials again.

Between 10.5 clients, this Kerberos exchange is only attempted if you connect using Bonjour. For example, if you navigate to the Mac in Finder, or use Finder's **Go** menu to connect to server "my-machine.local".

Normally, once your computer has gained a Kerberos ticket in this manner, you should keep that Kerberos ticket until it expires.

If you want to manually remove your Kerberos ticket, you can do so using the Kerberos utility in Mac OS X 10.5:

1. Open Keychain Access (in /Applications/Utilities).
2. From the **Keychain Access** menu, choose **Kerberos Ticket Viewer**.
3. In the Kerberos application's Ticket Cache window, find the key that looks like "`yourusername@LKDC:SHA1...`" followed by a long string of alphanumeric characters.
4. Click "Destroy" to delete that key.

Mac OS X Server version 10.5: Migrating MySQL Data when upgrading from Mac OS X 10.3 or 10.4

This article has been archived and is no longer updated by Apple.

Mac OS X Server version 10.5 Leopard preinstalls MySQL 5.0.45. Users upgrading from Mac OS X Server 10.3 or 10.4 to version 10.5 will need to migrate their MySQL data to ensure compatibility with the new version of MySQL.

This article outlines the steps needed to perform migration of standard MySQL databases. Users with more complex database designs may wish to refer to the documentation provided at www.mysql.org for additional documentation to help with migrating their database to MySQL 5.0, or refer to the links listed at the end of this article.

Before installing Mac OS X Server version 10.5 Leopard

Prior to upgrading your Mac OS X Server system, administrators should create a backup of their existing MySQL database.

This article describes how to migrate the default versions of MySQL included in Mac OS X Server 10.3.9 and 10.4.10 or 10.4.11. Mac OS X Server version 10.3.9 preinstalls version 4.0.18 of MySQL. Server version 10.4.10 preinstalls MySQL version 4.1.22. If you are unsure of the version of MySQL installed on your system, enter the following command in Terminal:

```
mysql --version
```

If you are using a version of MySQL other than those listed above, you may require additional steps not outlined below. For additional information about special steps needed by your version MySQL, refer to the links listed at the end of this article.

Preserving MySQL data

To migrate your MySQL databases from one computer to another, you can use the `mysqldump` command from a Terminal window. The mysqldump command has several forms depending on the scope of data to be backed up: Individual tables, single databases or the entire set of databases on the server.

To back up individual tables, type:

```
mysqldump database tb1 [tb2 tb3...] > backup-file.sql
```

(where *database* is the name of the database containing the listed tables and *tb1*, *tb2*, and *tb3* represent table names)

To back up one or more databases, type:

```
mysqldump --databases db1 [db2 db3...] > backup-file.sql
```

To back up **all** databases on the system, type:

```
mysqldump --all-databases > backup-file.sql
```

Preserving data with restricted privileges

To back up tables or databases that require root access (for example, grant tables or other restricted data), run mysqldump with the `--user=root & -p` options:

```
mysqldump --user=root -p --all-databases > backup-file.sql
```

The -p option will cause mysqldump to prompt for the MySQL "root" password before proceeding.

The resulting backup files from this command should be stored in a safe location that will not be modified during the Mac OS X Server upgrade process.

Additional instructions for database backup and restoration can be found in the MySQL documentation at www.mysql.org or the links listed at the end of this article.

After installing/upgrading to Mac OS X Server version 10.5 Leopard

Once the Mac OS X Server upgrade (or installation) is complete, make sure that the MySQL service is active before attempting to import backup data. The MySQL service can be activated using Server Admin or the serveradmin command.

```
serveradmin start mysql
```

Importing MySQL backup data into MySQL 5.0

To import database backups, use the mysql command line tool in Terminal. To perform the import, type:

```
mysql < backup-file.sql
```

To import into databases that require privileged access, run mysql with the --user=root & -p options:

```
mysql --user=root -p < backup-file.sql
```

The -p option will cause mysql to prompt for the MySQL "root" password before proceeding.

Additional instructions for database backup and restore can be found in the MySQL documentation at www.mysql.org or the links listed below.

Performing a MySQL 5.0 direct upgrade

For users that may have performed a system upgrade to Mac OS X Server 10.5 without previously saving their MySQL database, it is possible, in some circumstances, to perform a direct upgrade of the database version to MySQL 5.0 using the mysql_upgrade utility.

Before attempting to perform a direct upgrade, you should create a mysqldump backup of your database prior to the using mysql_upgrade to ensure that the original database is not affected by conversion failure or other interruption. It is also recommended that you consult the documentation provided at www.mysql.org about issues that may impact database upgrades.

To perform a direct upgrade of the MySQL database to version 5.0, type the following in Terminal:

```
/usr/bin/mysql_upgrade
```

Note: Due to an issue in version 5.0.45 of the mysql_upgrade tool, the full path to the tool must be used when executing mysql_upgrade.

To perform the upgrade for databases that may require privileged access, type:

```
/usr/bin/mysql_upgrade --user=root --password
```

Once the conversion is finished, the MySQL data will be compatible with MySQL 5.0.

Additional documentation

For comprehensive information regarding backup and restore of MySQL data, visit the www.mysql.org web site. The following articles will also provide information about optional steps that may be needed to address your specific database configuration:

- http://www.mysql.org/doc/refman/4.1/en/upgrading-from-4-0.html
- http://www.mysql.org/doc/refman/5.0/en/upgrading-from-4-1.html

Additional information about MySQL and Mac OS X Server can be found in the Mac OS X Server Upgrading and Migrating for Version 10.5 guide.

Mac OS X Server version 10.5: CoreFoundation Messages in Apache error log when performing Spotlight website search

This article has been archived and is no longer updated by Apple.

With Mac OS X Server version 10.5, with the Advanced Configuration, you can use the Server Admin application's Web panel to enable Web-based Spotlight searching for a website. Note that such searches might produce many messages such as the following in Apache's error log:

```
The process has forked and you cannot use this CoreFoundation functionality safely. You MUST exec().
Break on __THE_PROCESS_HAS_FORKED_AND_YOU_CANNOT_USE_THIS_COREFOUNDATION_FUNCTIONALITY___YOU_MUST_EXEC__() to debug.
```

This message does not indicate a configuration issue and it will not prevent the Spotlight search from returning the correct results.

This document will be updated as more information becomes available.

QuickTime 3: Windows Uninstall

The QuickTime 3 UnInstaller fails to remove all files installed by the QuickTime 3 Installer.
This article has been archived and is no longer updated by Apple.
When using Add/Remove Programs in Windows 95 to uninstall QuickTime 3 for Windows, the following files are not deleted from your hard drive.

Note: This also applies to Windows 98.

Windows\\System directory files:
3dviewer.dll
indeo4.qtx
ir41_qc.dll
ir41_qcx.dll
qd3d.dll
qd3d_ir2.q3x
qd3dcustomelements.q3x
quicktime.cpl
quicktime.qtp
quicktime.qts
quicktimemusicalinstruments.qtx
quicktimevr.qtx
rave.dll

Windows directory file:
uninst.exe

To correct this, these files must be manually deleted from your system using Windows Explorer or Find File. For more information on using these features, consult Windows on-screen help by choosing Help from the Start button.

The uninstaller also fails to remove all Windows Registry entries entered by the installer. The following entries remain in the Registry after running uninstall.

Hkey Classes Root:
quicktime.aif
quicktime.aifc
quicktime.aiff
quicktime.dif
quicktime.dv
quicktime.mac
quicktime.mov
quicktime.pct
quicktime.pic
quicktime.pict
quicktime.pntg
quicktime.psd
quicktime.qif
quicktime.qt
quicktime.qti
quicktime.qtif
quicktime.sd2
quicktimeextension
quicktimeimage
quicktimemovie
quicktimepreferences
quicktimesystem

There may also be other remaining entries. While these items are not needed on systems no longer running QuickTime, there are no known issues associated with leaving them in the Registry. If you wish to remove them, this must be done manually using the Registry Editor.

NOTE: Editing the Registry is recommended only in cases where it is required to restore your computer to a properly functioning state, and when performed by an experienced computer user. In all cases, it is strongly advised to make a full backup copy of your Registry before making any changes to it.

Mac OS X Server version 10.5: Group Web services not available after upgrade from 10.4

This article has been archived and is no longer updated by Apple.

Issue or symptom

After an upgrade from Mac OS X Server version 10.4 to Mac OS X Server version 10.5, site-specific Web services are not accessible for the default website. Server Admin Web shows the Services for Groups checkboxes in an indeterminate state (with a "-" in the checkboxes instead of a check mark).

Solution

1. In Server Admin, select the Web Service.
2. Click the Sites tab.
3. Select the default site from the list.
4. Click the Web Services tab.
5. Click the desired Web service checkboxes (once to disable, twice to enable).
6. Click the Save button.

Mac OS X 10.5: Some Sharing settings may not be preserved after migration or installation

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some Sharing settings may not be preserved when performing an Archive and Install installation of Mac OS X 10.5 Leopard, or when migrating from a previous version of Mac OS X to Mac OS X 10.5.

This can happen if sharing services such as Remote Login, Windows Sharing, or FTP Access were enabled within the Sharing preferences on the previous system before the Mac OS X 10.5 installation; they will not be enabled in the Mac OS X 10.5 once the migration or installation is complete.

Solution

To re-enable Windows Sharing

1. Open System Preferences
2. Click Sharing
3. Within the list of available services, highlight File Sharing, then click the Options button
4. In the sheet that appears, enable (click the check box next to) "Share files and folders using SMB"

To re-enable any other sharing service

1. Open System Preferences
2. Click Sharing
3. Within the list of available services, enable (check) the "On" box for each service you wish to use

Mac OS X Server 10.4, 10.5: Mail database issues after migrating to a different server

This article has been archived and is no longer updated by Apple.

Issue or symptom

After migrating a mail server from a PowerPC-based server to an Intel-based server, or vice-versa, POP and IMAP services may not work and various "DBERROR" messages may appear in the system.log file. This can happen in Mac OS X Server version 10.4, 10.5, or later.

Solution

1. Make sure that POP and IMAP are not running on the mail server.
2. Delete the deliver.db file located in the directory specified by the "Database location" field in Server Admin (the default location is /var/imap/db).
3. In Server Admin, click the Advanced tab, then click the Database pane.
4. Delete the contents of the db directory located in the directory specified by the "Database location" field in Server Admin (the default location is /var/imap/db). Note: Do not delete the db directory itself, only its contents.

Mac OS X Server version 10.5: Clients aren‘t auto-configured if user or server Name includes 2-byte or high-ASCII characters

This article has been archived and is no longer updated by Apple.

Issue or symptom

If a user's account name, or the server's computer name, contains a 2-byte or high-ASCII character, that user's applications (such as Mail or iChat) will not be automatically configured when they bind to a Mac OS X Server version 10.5 Leopard standard configuration.

Note: 2-byte characters are used to represent Japanese, Chinese, and Korean characters. High-ASCII characters are "extended ASCII" characters such as **ü** or **é**. They are listed in table II of this webpage: (http://www.cdrummond.qc.ca/cegep/informat/Professeurs/Alain/files/ascii.htm).

Solution

Download and install Mac OS X Server version 10.5.1 or later.

Important: Mention of third-party websites and products is for informational purposes only and constitutes neither an endorsement nor a recommendation. AppleScript, Mac OS X 10.5: Remote Apple Events setting not preserved after upgrading

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you use Remote Apple Events with AppleScript, after performing an upgrade installation (or Archive and Install) of Leopard from an earlier version of Mac OS X, you may notice that your "Remote Apple Events" setting is "off" (the default setting). With AppleScript, Remote Apple Events are extensible mechanisms commonly used in AppleScript for handing interprocess messages used for inter-application communication and also for applications running on different computers connected to a network.

Solution

Turn Remote Apple Events back on in Sharing preferences (in System Preferences).

Additional information

For more information about Sharing settings changing when migrating or performing an Archive and install of Mac OS X 10.5, see this article.

Published Date: Feb 20, 2012

Apple Remote Desktop 3.2: Customizing date formats

This article has been archived and is no longer updated by Apple.

Apple Remote Desktop (ARD) version 3.2 includes support for international, non-Gregorian calendar formats such as Japanese, Islamic, Buddhist, and Hebrew calendars.

ARD 3.2 makes customizable date formatting available in Mac OS X 10.4 or later. To customize a date or time format:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **International**.
3. Click Formats.
4. Click the Customize button in either the Dates or Times section.

ARD 3.2 uses the following date formats: Short Date, Medium Date, Full Date.

ARD 3.2 uses the following time formats: Short Time, Medium Time.

Mac OS X Server version 10.5: iChat client does not authenticate with Active Directory credentials

This article has been archived and is no longer updated by Apple.

Issue or symptom

When authenticating to a Mac OS X Server version 10.5 iChat server that is bound to Active Directory, clients that are *not* configured to use Kerberos will not be able to authenticate, when using Active Directory credentials.

Solution

Either configure the iChat client to use Kerberos authentication or disable the use of CRAM-MD5 authentication on the iChat server.

Option 1: Configure a client to use Kerberos

1. In iChat, choose **Preferences** from the **iChat** menu.
2. Click the Accounts pane.
3. Click the "Server Settings" tab.
4. Enable (check) the "Use Kerberos v5 for authentication" box.

Option 2: Disable use of CRAM-MD5 authentication on the iChat server

To do this, you will need to edit the authentication settings in the file /etc/jabberd/c2s.xml and restart the jabberd service:

1. Open the file /etc/jabberd/c2s.xml: sudo pico /etc/jabberd/c2s.xml
2. In the editing window, locate the authentication settings:

```
<traditional>
<plain/>
<cram-md5/>
<!--
<digest/>
<zerok/>
-->
</traditional>
```

3. To disable CRAM-MD5 authentication, comment out the line containing "`<cram-md5/>`" by adding "`<!--`" at the beginning of the line, and "`-->`" at the end:

```
<traditional>
<plain/>
<!-- <cram-md5/> -->
<!--
<digest/>
<zerok/>
-->
</traditional>
```

4. Save the changes (press Control-O), and exit pico (press Control-X)
5. Restart the jabberd service, like this:

```
launchctl unload /System/Library/LaunchDaemons/org.jabber.jabberd.plist

launchctl load /System/Library/LaunchDaemons/org.jabber.jabberd.plist
```

Xsan 1.4.2: Rebooting MDC may lead to shutdown delay

This article has been archived and is no longer updated by Apple.

Issue or symptom

Rebooting an MDC running Xsan 1.4.2 on Mac OS X 10.4.x or Mac OS X Server 10.4.x may result in a potentially endless shutdown delay.

This issue may occur sporadically on Mac OS X 10.4.x and Mac OS X Server 10.4.x systems with Xsan 1.4.2.

Solution

If shutdown process does not complete after several minutes, it may be necessary to force-restart the affected computer.

This document will be updated as more information becomes available.

Mac OS X Server version 10.5: Configuring forward Web Proxy

This article has been archived and is no longer updated by Apple.

Issue or symptom

Users connecting to your Mac OS X Server version 10.5 Web Proxy server cannot connect to the Internet, or load the Mac OS X Server's Web page when trying to connect to other sites.

Solution

To configure Web service forward proxy settings:

1. Open Server Admin and connect to the server.
2. Click the disclosure triangle to the left of the server. The list of services appears.
3. From the expanded Servers list, choose Web.
4. Click Settings, then click Proxy.
5. Click (check) the Enable Forward Proxy checkbox. If a forward proxy server is enabled, each site on the server can be used as the proxy.
6. Click the "Control Access To Proxy" checkbox to limit access and then enter the domain name that is permitted access in the “Allowed Domain” field. Generally, when limiting who can use your Web server as a proxy, you should limit access to a specific domain. Users in that domain may obtain access.
7. Create the Cache Folder. In a terminal window, enter:

```
sudo mkdir /var/run/proxy
sudo chown www:www /var/run/proxy
```

Note: This is the default cache folder. You can choose or create a different folder for the cache, but you must make sure that the owner and group are both www and have read and write access. To choose a different folder, click the Choose... button or type the path into the Cache Folder field in Server Admin. If you are administering a remote server, File service must be running on the remote server to use the Choose... button.

8. Set the disk cache target size and set an interval for emptying the cache. When the cache reaches this size, the oldest files are deleted from the cache folder.
9. To add a host to block, click the Add (+) button and enter its URL. Add the names of all hosts you want to block. You can import a list of websites by dragging the list to the list of blocked hosts. The list must be a text file with the host names separated by commas or tabs (also known as csv and tsv strings). Make sure the last entry in the file is terminated with a carriage return/line feed; otherwise, it is overlooked.
10. Click Save.
11. Click the Sites tab and select the default site (the one whose Address is listed as "*").
12. Click the Aliases tab.
13. Select the Alias listed as "*".
14. Click the minus ("-") button to delete the Alias.
15. Click Save.

Xsan: Changing configured notifications relay hostname may require reboot

This article has been archived and is no longer updated by Apple.

Issue or symptom

If a SAN is already configured to send notifications, and the configured hostname is changed, notifications may continue to be sent using the previously-configured hostname.

Solution

Restart the computer on which the Notifications configuration was updated.

Mac OS X Server version 10.5: To optimize performance on heavily-loaded webservers, disable mem_cache_module

This article has been archived and is no longer updated by Apple.

Issue or symptom

When running Apache 2, if you have a very high-volume webserver, or are running benchmarks, you should disable mem_cache_module.

Solution

Disabling mem_cache_module can improve performance. To disable mem_cache_module:

1. Open Server Admin.
2. Go to Web.
3. Click Settings.
4. Click the Modules tab.
5. Deselect (uncheck) "mem_cache_module".
6. Click Save.

iMac: Less Available Memory Due to ROM in RAM

Why do I have a little less memory available on iMac than I do on other Power Macintosh G3 Computers after startup?
This article has been archived and is no longer updated by Apple.
Compared to a similarly equipped 233-MHz Power Macintosh G3 computer (desktop or minitower) with 32MB of DRAM and running Mac OS 8.1, iMac uses approximately 4MB more DRAM.

That's because iMac is unique in a number of ways. For example, iMac contains 1MB of ROM on the logic board and also loads Mac OS ROM into RAM when you start up your computer. This increases the amount of memory the system uses but also improves overall performance.

Of course, the amount of DRAM you actually have to run applications varies depending on the specific way you configured your computer--for example, how many extensions and other system resources you use.

That's why we recommend that you leave Virtual Memory (VM) turned On. If you turn VM off, system size will increase to 17.5MB.

Mac OS X Server version 10.5: MySQL libraries available for download

This article has been archived and is no longer updated by Apple.

Issue or symptom

MySQL client libraries and headers are not included with Mac OS X Server 10.5. If you are developing a MySQL client application for Mac OS X 10.5, you'll need to download the MySQL client libraries and headers.

Solution

The MySQL client libraries and headers are available for download and installation from (http://www.opensource.apple.com/darwinsource/Current/).

- The MySQL sources are available from (http://www.opensource.apple.com/darwinsource/tarballs/other/MySQL-43.tar.gz), and also include instructions on using the supplied Makefile.
- A binary download that can be installed on Leopard Server is available from (http://www.opensource.apple.com/darwinsource/other/MySQL-43.binaries.tar.gz).

To install:

1. Download the file.
2. If the download doesn't automatically produce a folder on your desktop, double-click it to unzip it to a folder named "MySQL-43.binaries" which has a file named "MySQL-43.root.tar.gz" in it (as well as the readme file). **Note:** Do not double-click/unzip the "MySQL-43.root.tar.gz" file that is within the folder.
3. Open Terminal.
4. Type `cd` (but do not press Return).
5. Drag the "MySQL-43.binaries" folder from your desktop to the Terminal window to populate the cd path, then press Return.
6. Execute this command:

```
sudo tar -xzvf MySQL-43.root.tar.gz -C /
```

Mac OS X Server 10.5 Leopard: Remote access to built-in camera requires logged-in user on client Mac

This article has been archived and is no longer updated by Apple.

Issue or symptom

When using the `pcastagentd` command-line utility to access a remote Mac OS X 10.5 Leopard client's built-in iSight camera over ssh, an alert message about not connecting to the camera may appear.

Solution

Make sure a user account is logged in on the client Mac before attempting access to its camera via `pcastagentd` and ssh. This command should work even if a screensaver is password-protecting the computer.

Note: You can bind to the camera while no user is logged in, but recording will not work unless a user is logged in.

Mac OS X Server version 10.5: Hosting a wiki without enabling blog services

This article has been archived and is no longer updated by Apple.

You can host a wiki without enabling blog services for a particular group with these steps:

1. Enable Web services and wiki/blog services for a particular site.
2. On the Open Directory Master, open Preferences in Workgroup Manager.
3. Click "Show all records Tab and Inspector."
4. Click the Accounts icon
5. Click the target tab:

6. From the pop-up menu, choose Groups.
7. Click the disclosure triangle next to the ServicesLocator attribute.
8. Delete the value that ends in ":blog".
9. Save the changes.

Using USB Braille displays with VoiceOver in Mac OS X 10.5 Leopard

This article has been archived and is no longer updated by Apple.

VoiceOver in Mac OS X 10.5 Leopard supports refreshable USB Braille displays.

While VoiceOver is running (press Command-F5 to turn it on or off), you can connect a compatible USB Braille display and start working with no additional setup or configuration.

You can also use a Braille display while installing Mac OS X Leopard itself.

Additional information about using Braille displays with VoiceOver is available in VoiceOver Help in Leopard.

iPhone: What to do if visual voicemail greeting is incorrect

This article has been archived and is no longer updated by Apple.

Issue or symptom

The visual voicemail personal greeting on iPhone may not match the standard voicemail personal greeting.

Solution

This is most likely caused by dialing into your voicemail, instead of using visual voicemail, to change an option such as new greeting, or changing to or from the default greeting.

The recommended way to change your voicemail greeting is by choosing **Phone > Voicemail > Greeting**, which will then in turn synchronize with your standard voicemail greeting so they both are the same.

In most cases, voicemail greeting changes made by dialing your voicemail will be synced back to visual voicemail on iPhone if you are using iPhone Software 1.1.3 or later.

Mac OS X Server version 10.5: NetInstall images created from a volume may not restore

This article has been archived and is no longer updated by Apple.

Issue or symptom

A NetInstall image created from a volume may not be able to restore clients.

Solution

1. In the .nbi folder for the affected image, mount the NetInstall.dmg file.
2. Get Info on the mounted disk image and make sure "Ignore ownership on this volume" is not selected (not checked) .
3. Execute the following command in Terminal:

```
/usr/sbin/asr imagescan --source '/Volumes/NetInstall/System/Installation/Packages/System.dmg' --filechecksum
```

4. When the asr command completes, unmount the NetInstall image.

Mac OS: "AppleTalk Network Has Been Interrupted" Error

I keep getting the message "Access to your AppleTalk network has been interrupted. When the network becomes available again, a message on your screen with notify you."

Why is this happening?
This article has been archived and is no longer updated by Apple.
Some Ethernet-ISDN bridges used for remote LAN-to-LAN connectivity drop the connection when there is no active data transfer, and dial on demand when there is information to be transferred. If a user's local network does not include an AppleTalk router, a message appears each time the connection is dropped.

There is also an issue with Apple Remote Access 3.0 which can cause the message. ARA processes incoming Router Table Maintenance Protocol (RTMP) packets. ARA 3.0 incorrectly processes these packets. On some networks, this can cause the client to assume that the network is inaccessible. In this situation, an alert is posted to notify the user that access to the AppleTalk network has been interrupted. If additional RTMP packets are processed correctly, the network is assumed to be available again. ARA Client 3.1.2, which ships with Mac OS 8.5, resolves this issue.

Workarounds include:
1. Disable Apple Remote Access 3.0 extensions via the Extensions manager control panel.

2. Use the "AppleTalk Options" control panel, available by downloading "OT 1.1.2-Extras.sea" from the Apple Software Updates site.

After downloading, the AppleTalk Options control panel is located in the Open Transport Extras -> Network Options -> AppleTalk folder.
- Drag the control panel to your System Folder and Restart.
- After restarting the computer, check the option for "Suppress router-related alerts."

Note: This option will only avoid the interruption message, it will not resolve any loss of network connectivity.

3. Select the Advanced User mode in the AppleTalk control panel (select User Mode under the Edit Menu). Once you are in Advanced User mode, check the User defined box. Enter a valid network number and try a random node number (between 1 and 253) and close the AppleTalk control panel. If the node number is not already being used you can reopen the control panel and uncheck the User defined box. If the node number is already being used, reopen the control panel and try another node number. Repeat the process until a valid AppleTalk address is entered.

If the problem still occurs after the above suggestions the next thing to do is to test the unit on an isolated network to see if it only occurs on the large network.

Article 24549 titled **ARA 3.0: "AppleTalk Network Not Available" Message**, may be of some assistance in resolving this issue also.

This article can help you locate the software update mentioned here:

Apple Portables: Wait for pulsing sleep indicator light before moving system

This article has been archived and is no longer updated by Apple.

When putting your Apple portable computer into sleep mode, be sure to wait a few seconds until the sleep indicator light starts pulsing before moving your Apple portable computer. The pulsing light indicates that the computer is fully asleep and the hard disk has stopped spinning.

Important: Moving your computer while the disk is spinning can damage the hard disk, causing loss of data or the inability to startup from the hard disk.

Mac OS X 10.5: Unable to start up after installing Apogee audio drivers

This article has been archived and is no longer updated by Apple.

Issue or symptom

Installing earlier Apogee audio drivers may prevent Mac OS X 10.5 Leopard from starting up.

Note: Mac OS X 10.4.x installations with older Apogee drivers that are updated to Leopard are not affected by this issue.

Solution

This can happen if you install an earlier Apogee driver on Leopard. Current drivers for the Ensemble and Symphony card can be found on the Apogee Leopard page.

If your Mac is affected, repair permissions and reinstall Leopard:

1. Restart your Mac while holding the **Option** key.
2. When a screen showing the available startup partitions appears, press the **Eject** key.
3. Insert the Mac OS X 10.5 install DVD and select it as the startup disk.
4. After the Mac has started up from the disc, choose a language
5. Choose **Utilities** from the **Disk Utility** menu.
6. Use Disk Utility to select the system drive and click the **Repair Permissions** button.
7. Quit Disk Utility.
8. In the **Select Destination** window, choose the partition Leopard is to be installed on. This should be the same partition as used before. Click the **Options** button and choose "Update Mac OS X".
9. The computer will restart after installation has completed.

After your system has been reinstalled, download and install updated Apogee software and drivers from the Apogee Leopard page.

About the security content of Xcode Tools 2.5

This article has been archived and is no longer updated by Apple.

This document describes the security content of Xcode Tools 2.5, which can be downloaded and installed from http://developer.apple.com/tools/download/.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see Apple Security Updates.

Xcode Tools 2.5

- **gdb**

  CVE-ID: CVE-2006-2362

  Available for: Mac OS X v10.4.x, Mac OS X v10.5

  Impact: Processing a file with maliciously crafted TekHex content may lead to an unexpected application termination or arbitrary code execution

  Description: A buffer overflow exists in gdb's handling of files with Tektronix Hex Format (TekHex) content. By enticing a user to run gdb's "restore" command on a maliciously crafted TekHex file, an attacker may cause an unexpected application termination or arbitrary code execution. This update addresses the issue by performing additional validation of TekHex records.

- **WebObjects**

  CVE-ID: CVE-2006-5327, CVE-2006-5328

  Available for: Mac OS X v10.4.x, Mac OS X v10.5

  Impact: An unprivileged local user may be able to obtain system privileges

  Description: The Xcode WebObjects package contains a demo version of OpenBase for use with WebObjects example code. This demo version of OpenBase may allow a local user to obtain system privileges. This update addresses the issue by disabling the Apple-provided demo version of OpenBase. Credit to Kevin Finisterre of Netragard for reporting these issues.

DVD Studio Pro: Attempting to read multiple DLTs may not work

This article has been archived and is no longer updated by Apple.

Issue

Attempting to read multiple DLTs (Digital Linear Tapes) or dual layer DLTs may result in the application becoming unresponsive.

Affected Products

- DVD Studio Pro 4.2.0
- OS X 10.4.10

Workaround

Update to Mac OS X 10.4.11 to resume proper functionality of DVD Studio Pro if you are using the application to read DLTs.

Published Date: Feb 20, 2012

LaserWriter 8.4.1: Apple Printer Software Read Me

This document contains some important reminders and some information about your Apple LaserWriter Printer Software for Mac OSÂbased computers. You may want to print this document and keep it for future reference.

The topics are:

- Desktop PrintMonitor Version 2.0.1
- Apple Printer Utility Version 2.1.1
- LaserWriter 8 Printer Driver Version 8.4.1

This article has been archived and is no longer updated by Apple.

Desktop PrintMonitor Version 2.0.1

- New Features in Version 2.0.1

Enhanced user interface - desktop printer icons display the icon of the printer selected, unless the PostScript Printer Description file for the printer selected is not installed in your Printer Descriptions folder. In this case, the desktop printer icon displays the icon for LaserWriter 8.

- Hints and Shortcuts

The Desktop Printers folder in the Apple Menu provides a convenient shortcut to desktop printers. This is especially helpful if you have moved your desktop printer icons off the desktop. Command-L key combination is a shortcut equivalent to the Set Default Printer command in the Printing menu. Holding down the Option and Shift keys makes the Hold and Resume buttons function as Stop Print Queue and Start Print Queue. To print additional copies of a file, you can select the spool file waiting in the print queue and choose Duplicate from the File menu.

- Creating Desktop Printers

To create a desktop printer, select a printer in the Chooser and click the Create/Setup button. If you have System 7.5 or later, you can create multiple desktop printers from within the Chooser, but if you're running an older version of system software, you can only create one desktop printer per Chooser session.

- System Software Requirements for Desktop Printing

Desktop printing requires System 7.1 or later of the Macintosh Operating System (Mac OS). If you have System 7.0 or earlier and you want to use desktop printing, you can upgrade your Mac OSÂbased computer to use a later version of system software. Contact your Apple-authorized dealer.

- Printing with Multiple Desktop Printers

To avoid AppleTalk errors, print to no more than five desktop printers simultaneously.

- Using Desktop PrintMonitor on a Non-English System

If no desktop printer icon appears after you install the printer software, it may mean the Installer installed PrintMonitor 7.1.2 and did not install the Desktop PrintMonitor. (PrintMonitor 7.1.2 is installed if you have an earlier version of the PrintMonitor. Later versions of the PrintMonitor are not replaced.) You have three options: Use PrintMonitor 7.1.2 (or a later version).

Obtain a set of installation disks for the printer software in the language of your system software from your Apple-authorized dealer and install it. Upgrade your system software to System 7.5.1 and install the printing software again. An English language version of the Desktop PrintMonitor software is installed.

- Using the Desktop Printer Menu and the Printer Selector Control Strip

The desktop printer menu extension can be installed using the Custom Install option.

The Desktop Printer menu appears on the right-hand side of your menu bar. It will normally appear to the immediate left of the Guide menu. The Desktop Printer menu lists the names of all active desktop printers. A check mark is displayed next to the name of the default printer. Selecting the name of a printer from this list makes the printer the new default.

The Printer Selector control strip module is installed only on computers that already have control strip software installed. The Printer Selector adds an item to the control strip that provides functionality identical to the Desktop Printer menu.

- Support and Compatibility Information

Some third-party printers do not support desktop printing. If your printer is not an Apple product, and no desktop printer icon is created after you select your printer in the Chooser, it is likely that your printer does not support Desktop PrintMonitor. Please contact the vendor of your printer to see if there is a version of the driver that is compatible with Desktop PrintMonitor.

When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.

Desktop PrintMonitor supports drag-and-drop printing for all files that cause the Print Command in the File menu to become enabled. Since clipping files do not enable the Print command, drag-and-drop printing is not supported for them.

Apple's Fax Sender software is not supported by Desktop PrintMonitor. Fax Sender is fully functional when Desktop PrintMonitor is installed. However, it does not get the benefit of Desktop PrintMonitor's features. When you select Fax Sender in the Chooser you will not have a default desktop printer until you choose a printer icon and select "Set Default Printer" from the Printing menu.

Spool files and desktop printers must use the same version of the LaserWriter 8 driver. You may encounter errors if you drag spool files that were created with one version of LaserWriter 8 to a desktop printer created with another version of the LaserWriter 8 driver.

If, after installing the LaserWriter 8.4.1 driver, your print jobs "stall" in their desktop printer queue, try restarting both your computer and the printer.

- Tips for Desktop Printing Troubleshooting

Error message "-192"Â or "15"

--Problem: After installing Desktop PrintMonitor and restarting your Mac OS computer you see error messages "-192" or "15" when you try opening files or folders in the Finder. This may occur when Now Startup Manager's preferences file has become corrupted.

Solution: Restart your computer with extensions disabled (hold down the Shift key while restarting). Delete the "Now Startup Manager" preferences file, and restart the computer again with extensions enabled. Important: Before deleting your Now Norton Startup preferences, you may want to record them or write them down before you delete this file.

--Desktop printer cannot be found

Problem: When you try to print, your spool files are moved to the Trash and an alert is displayed saying that the desktop printer could not be found.

Solution: There are two likely solutions to this problem. First, it is possible that your desktop printer has somehow become damaged. To fix this, drag the desktop printer icon to the Trash and reselect the printer in the Chooser. A new desktop printer icon will be created.

Second, your printer software may not be using a file format that is completely compatible with Desktop PrintMonitor. If your printer software is not published by either Apple Computer or Adobe Systems, it is possible that it is not making proper and legitimate use of PrintMonitor. If this is the case, your printer software will not work properly with Desktop PrintMonitor. The only resolution to this problem is to disable Desktop PrintMonitor and use old PrintMonitor. To print the documents you were working on follow these steps:

1. Empty the Trash.
2. Go to the Chooser and turn off background printing.
3. Print documents again.

To correct desktop printing:
4. Drag the desktop printer to the Trash.
5. Go to the Chooser and turn background printing back on.
6. Create a new desktop printer.

--Not enough memory message when dragging files to desktop printer

Problem: When you drag documents created by different software applications to your desktop printer icon, a message is displayed indicating that there is not enough memory to continue.

Solution: You may not have enough memory available to launch all of the software applications corresponding to the documents you have selected. You can resolve this situation by printing your documents individually or in smaller groups.

- Options dimmed in Printing menu
Problem: "Get Printer Info" and "Change Setup" appear in your Printing menu, but can't be selected.

Solution: These are two new functions supported by LaserWriter v8.4. If these or other items in the menu appear dimmed and cannot be selected, it is because you are using a version of the LaserWriter 8 printing software that doesn't support their respective functions.

- Spool files sometimes don't appear when using Connectix Speed Copy

Problem: Spool files don't always appear in the Desktop Printer queue after copying with Speed Copy.

Solution: Close and open the Desktop Printer queue window to make the file appear.

Apple Printer Utility Version 2.1.1

- Printer Support

The Apple Printer Utility program works with all Apple PostScript Level 1 and Level 2 printers. If this software is used with a non-Apple printer or with a printer developed after this release, a set of generic features will be available. The generic feature set consists of options that are common to most PostScript printers. These features should work with non-Apple printers but are not specifically supported by Apple.

- Printing the Font Sample List

Duplicate fonts in the printer's ROM, RAM, or hard disk, may not print on the font sample sheet and font totals may be incorrect. However, these fonts are available and will print correctly on any documents printed by the user. Note: The hard disk option is not available for all Apple printers.

- Working with a Large Number of Downloaded Fonts

If you plan on working with a large number of downloaded fonts, you will need to increase the memory allocation for the Apple Printer Utility. To do this, quit the Apple Printer Utility, select its icon and choose Get Info from the File menu. Increase the memory in the Preferred Size box, then close the Get Info window. The amount of memory required grows dynamically as the number of fonts in the printer increase. Increase the Apple Printer Utility's Preferred Size memory by 100K to 500K and try downloading again.

- Working with Kanji Systems

The script mode changes to Kotoeri when clicking into an input field. To recover from this problem select a one-byte script from the script menu in the upper right corner of the screen.

- Working with Kanji/Japanese Fonts

Downloading Kanji fonts is not a supported feature of this software and program errors may occur. Increase the Apple Printer Utility's Preferred Size memory by the size of each Kanji font you want to download.

- Downloading PostScript Fonts on a GX System With the Apple Printer Utility

When GX is installed, any PostScript fonts (often called Type 1 fonts) in the Fonts folder are converted to GX fonts, and the original PostScript fonts are copied to a new folder called Archived Type 1 Fonts which is created in the System Folder. If you want to download these fonts to your printer using the Apple Printer Utility, you must send the fonts in the Archived Type 1 Fonts folder, not the GX-converted versions in the Fonts folder. Downloading GX fonts that were not previously Type 1 fonts and converted by GX works correctly.

- Removing Fonts From a Hard Disk Attached to a Printer

This paragraph is relevant if you are using a printer that will have a hard disk drive attached to it. The LaserWriter 12/640 PS does not support a hard disk drive attachment.

If a font is downloaded to both the printer's RAM and the printer's hard disk with the same name, and you remove the font on the hard disk, the RAM font will also be removed. If you remove the RAM font, the font on the hard disk will not be removed.

LaserWriter 8 Printer Driver Version 8.4.1
The software includes version 8.4.1 of the Apple LaserWriter 8 printer driver, which works with Apple LaserWriter printers. This section contains information about LaserWriter 8 and information on using it with several of the printers.

- What's New in Version 8.4.1

LaserWriter 8.4.1 provides improved functions and application compatibility.

In LaserWriter 8.4 Get Printer Info or Change Setup can not be used when Connectix' Speed Doubler is also in the Extensions folder. LaserWriter 8.4.1 corrects this conflict with Speed Doubler.

- Larger Print Area

Some printers support both US Letter and US Letter Small paper sizes. To prevent text from clipping or wrapping to the next line on different printers, use US Letter Small. To get the widest possible margins from your printer model, use US Letter.

- Using PostScript Fax

PostScript Fax is an option for the LaserWriter Select 360, the LaserWriter 16/600 PS, and the LaserWriter Pro 810. If you use a PostScript Fax option with any of these printers, you should use LaserWriter 8f version 8.2.3f. PostScript Fax is no longer supported with LaserWriter drivers 8.3 and beyond. See the section "How To Get Updated Printer Software" at the end of this Read Me for information on obtaining LaserWriter 8f version 8.2.3f if you don't already have it.

- Using Color Matching

When ColorSync 2.0 is installed and the ColorSync Profiles folder contains printer profile(s), there are two options in addition to color/grayscale output:

PostScript Color Matching/Printer's Default is the preferred color-matching choice. When you are printing to a PostScript Level 2 printer, and it is efficient to let the printer do most of the work, this option is a good choice.

ColorSync Color Matching is an alternative color-matching selection. It invokes the ColorSync system software to perform color matching for the printed document, matching your monitor and printer's profile and sending the correct color information to the printer. With ColorSync Color Matching, most of the work is done by your Macintosh.

- Here are some tips on using color matching:

Color output will vary depending on the application you are using.

Documents that use ColorSync 1.0 embedded profiles convert to the profile set up in the ColorSync 2.0 System Profile control panel.

When you print with PostScript Color Matching selected and ColorSync 2.0 is not installed, the driver uses the Apple 13" RGB Standard profile.

Application programs that generate their own PostScript may have problems color matching EPS or TIFF images correctly. Converting the image to a PICT file corrects the problem.

- PPD Files

The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle.

To take full advantage of your printer's features, you need to go through a simple setup procedure. When selecting your printer for the first time, or after installing an additional option, click the Create/Setup button in the Chooser. This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer.

Xsan: Computer showing IPv6 address may not allow authentication

This article has been archived and is no longer updated by Apple.

Issue or symptom

In Xsan Admin, you may see computers that you wish to authenticate are displayed with only their IPv6 addresses, and you may not be able to authenticate them.

Solution

Use Network preferences to disable IPv6 on all of the SAN computers. After making the change on each computer, restart that computer.

Mac OS X Server 10.5: Unable to join Windows clients to PDC after upgrading

This article has been archived and is no longer updated by Apple.

Issue or symptom

When attempting to join a Windows client to a Mac OS X Server version 10.5 Leopard that was upgraded from Mac OS X Server 10.4 Tiger, you may receive an "access denied" alert on the Windows client.

The workgroup name is stored in two places. This issue may occur if the two names do not match.

Solution

Check the workgroup name in Server Admin for the SMB server, and in the WINS tab in Network preferences.

1. Open Server Admin
2. Select SMB from the services on the left
3. Click the Settings button
4. Click the General tab
5. Note the name of the workgroup
6. Open System Preferences
7. Click Network
8. Select the appropriate interface on the left
9. Click the Advanced button
10. Click the WINS tab
11. Enter the same workgroup name that you noted in Server Admin

MacBook (Late 2007): Instruments are grayed out and content may not download in GarageBand after restoring from DVD

This article has been archived and is no longer updated by Apple.

Issue or symptom

After restoring your operating system from the DVDs that came with your MacBook (13-inch Late 2007), you may notice that some instruments in the GarageBand Track Info window are grayed out. You may also notice that content may not download in the GarageBand Loop Browser when you click a grayed-out loop and select a Download Now option.

Solution

To address these issues, reinstall GarageBand from your DVD set using the following procedure:

1. Insert Mac OS X Install Disc 1.
2. Click **Install Bundled Software Only**.
3. In the Installer window, click **Continue**.
4. Click **Continue** to accept the Software License Agreement.
5. Click **Agree**.
6. Click **Customize**.
7. Toggle the triangle next to Bundled Applications
8. Select **GarageBand** and click **Install**.
9. Continue installation and type in your password.
10. After DVD1 ejects, locate and insert Mac OS X Install Disc 2. Garage Band will reinstall.
11. When the Install Succeeded screen appears, click **Close**.

Managed Client: Settings not applied on first login after startup in Mac OS X 10.4

This article has been archived and is no longer updated by Apple.

Issue or symptom

Preferences specified in Workgroup Manager may not be applied when logging in for the first time after startup.

Solution

On the client computer, edit (or create) /etc/rc.local and add the following line:

```
/bin/sleep 10
```

Mac OS X 10.5, iChat: Echo, feedback, or "whine" in audio or video chats

This article has been archived and is no longer updated by Apple.

If you hear an echo, feedback, or "whine" when you speak during a video or audio chat with another Mac OS X 10.5 user, it is possible that iChat's noise cancellation is not fully functioning on the remote side of the conference.

Ask the other participant to try the following steps one at a time while you are still connected. After each step, it may be necessary to speak for a few seconds to test whether or not the change helped.

1. If the microphone on the remote side is close to the speakers (and not built-in), adjust the speakers and/or the microphone so that they are further apart.

2. Adjust the volume of the microphone in Sound preferences:
    a. From the **Apple** menu, choose **System Preferences**.
    b. Click the Sound icon.
    c. Click the Input tab.
    d. Move the Input Volume slider to the left, but not so far that the other person can't hear you.

3. If the issue persists, adjust the speaker volume. First try to lower the volume. If this does not work (or the volume is already low), raise the speaker volume and see if this helps.
4. If the issue persists, restart the audio or video conference.

Remember, if you hear an echo, feedback, or whine when you speak, then it is the remote side that must make these adjustments. Conversely, if the other person says that they hear an echo, feedback, or whine when they speak, then it is likely you need to make these adjustments.

Final Cut Pro 6: Master Templates do not display in Mac OS X 10.5 Leopard

This article has been archived and is no longer updated by Apple.

Issue

On computers running Mac OS X 10.5 Leopard, Master Templates (templates created in Motion) do not display in Final Cut Pro 6. If you open a Master Template in Final Cut Pro, it may appear in the Viewer and the Canvas as blank or black on a computer with Leopard.

Solution

This issue is addressed by updating to Motion 3.0.2 and Final Cut Pro 6.0.2.

Choose **Software Update** from the **Apple** menu to get the latest updates for your Final Cut Studio software, or go to Apple Downloads.

iTunes 7.4 for Windows: Low bit-rate AAC files may sound distorted

This article has been archived and is no longer updated by Apple.

Issue

In some cases, audio files encoded in iTunes 7.4 on Windows may sound distorted, or may play back with the wrong duration. This can happen if you choose a low bit-rate (80 kbps or lower) for encoding in iTunes preferences.

Solution

To prevent this issue, update to iTunes 7.5.

About the Mac OS X Server 10.5.1 Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server version 10.5 to version 10.5.1.

Important: Read before installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank. If you need to change your password, see this article.
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. (This doesn't apply to normal software installation.)
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Support Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server version 10.5.1. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are three ways to update to Mac OS X Server 10.5.1: Use Software Update, install from a standalone installer, or install on a remote computer via the `softwareupdate` command.

Software Update installation

Software Update may have referred you to this document. For more information on this feature, see this article. Because some updates are prerequisites for others, you may need to use Software Update more than once to obtain all available updates.

Standalone installer

Download the update installer and run it manually. This a useful option when you need to update multiple computers but only want to download the update once.

Remote installation

If you need to install the update on a remote computer, you can do so using the `softwareupdate` command-line tool.

What's included?

This update delivers several improvements, including:

Server Preferences

- Addresses an issue which could prevent external users from being added to a newly-created group in Server Preferences.

NetBoot

- Addresses an issue in which 10.5.x-based software images could lead to an unresponsive NetBoot client.

Open Directory

- Addresses an issue blocking control of client application access when usernames contain non-ASCII characters.
- Addresses intermittent Password Server errors.

SMB File Service

- Addresses an issue in which Microsoft Windows clients may misinterpret shared folders' ACL settings.

Mac OS: When and Why to Perform a Clean Installation

This article discusses system software faults or symptoms that may require a clean installation of system software to resolve. Specific instructions on performing a clean installation may be found in the articles listed in the Discussion section.
This article has been archived and is no longer updated by Apple.
Clean installation refers to a method of preparing for and installing the Mac OS operating system such that the existing System Folder is disabled and a new one created. Links to additional information about performing a clean installation for different Macintosh computers and Mac OS operating system versions can be found at the end of this article.

What Is a Clean Installation?
A standard system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving all files in place, and directs the Installer to create a new System Folder. The old System Folder will be renamed "Previous System Folder," and from there you can drag any fonts, preferences, or other necessary files to the new System Folder. You should drag as few items as possible, since some items in the previous System Folder may be the cause of your difficulties.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software is unusable or has been modified, preventing a normal installation. It is also useful as a final step in troubleshooting.

When To Perform a Clean Installation
A clean installation may be appropriate in the following circumstances:

- when issues occur either during system startup or after startup is complete.
- when the Mac OS installer fails to complete.
- to fix a flashing question mark on startup.
- when the System Folder has become cluttered with unneeded or unfamiliar software.

In most of these instances, a clean installation should not be the first step in troubleshooting. The more premature a clean installation, the less productive it will be in identifying the source of the trouble.

Perform the following troubleshooting procedures to help you determine whether a clean installation is appropriate. Taking the time up front to locate the source of the issue will save you time in the long run.

Stops Responding During Startup

1. Hold down the Shift key while starting up the computer to disable extensions. If the computer fails to start up, there may be an issue with the core system software.

2. Start up from a known-good system disc such as the system software CD that came with the computer, a bootable floppy disk, or a bootable external hard drive. If starting up from another system disk succeeds, the system on the hard disk is unusable.

3. Perform a clean installation (links to instructions are at the end of this article).

Exception: If the computer starts up to a Type 41 error with extensions off, the issue is probably with the Finder alone. Instead of performing a clean installation, drag the Finder file from the System Folder to the Trash, then perform a regular installation over the existing System Folder.

Stops Responding While Using a Particular Program or During Program Installation

1. Start up from a known-good system disc such as the system software CD that came with the computer, a bootable floppy disk, or a bootable external hard drive. If certain extensions are needed to run the program you are testing, start up from a disk or CD that contains the necessary extensions.

2. Run the program to see if it crashes with known-good system software. If you cannot reproduce the troublesome behavior, your system software may be unusable.

3. Perform a clean installation.

Random Faults
There may be a fault with the core system software that affects system stability.

1. Start up from a known-good system disc such as the system software CD that came with the computer, a bootable floppy disk, or a bootable external hard drive. If certain extensions are needed to run the program you are testing, start up from a disk or CD that contains the necessary extensions.

2. Run programs one at a time to see if they stop responding with known-good system software. If you cannot reproduce the fault, your system software may be unusable.

3. Perform a clean installation.

Fault During Clean Installation
A Mac OS Installer fault may occur when a clean installation is needed.

1. Disconnect or turn off all peripherals except the keyboard, mouse, and monitor.

2. Perform a clean installation.

Flashing Question Mark on Startup

1. Start up from a known-good system disc such as the system software CD that came with the computer, a bootable floppy disk, or a bootable external hard drive.

2. Look in the System Folder for files named System and Finder. Some computers (for example, an iMac) also include a file named Mac OS ROM.

3. Use Find File to locate the files if they are not found in the System Folder.

4. Move the files back to the root level of the System Folder by dragging them onto the closed System Folder.

5. Restart the computer from the hard drive.

6. If the computer still fails to start up successfully, confirm that the System Folder is "blessed" by looking at the closed System Folder icon on the hard drive. If it does not have a small Happy Mac face or Macintosh computer icon superimposed upon it, open the System Folder, then close it and check again. If the System Folder icon still does not appear as described, use Find File to search for "System Folder". There should be only one System Folder on a Macintosh volume. If there is more than one on the same volume (not on different volumes), give the other System Folder(s) a different name, then restart.

7. If the computer still fails to restart successfully, one or more of the system files may be unusable.

8. Open the System Folder and double-click on the System file to open it. If it opens successfully, perform a clean installation; otherwise, drag the System file from the System Folder to the Trash, then perform a regular installation over the existing System Folder.

System Folder Cluttered
After many program installations and removals, the System Folder can become cluttered with extensions and other files that are of uncertain origin or that may no longer be needed. This creates wasted storage space and RAM. Clean installations performed for this reason are done for convenience, not necessity.

MacBook (Late 2007): Preview may close without warning when saving adjusted jpeg files

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you use the Preview application to adjust the brightness or contrast, then save a jpeg image, Preview may close without warning and not save the image.

Solution

Import the jpeg into iPhoto to make the desired brightness or contrast adjustments. Do not adjust jpeg images with the Preview application on the MacBook (Late 2007).

iPhoto 2: Can‘t publish to .Mac, "Please upgrade to a newer version..." appears

This article has been archived and is no longer updated by Apple.

Issue or symptom

You are unable to use iPhoto 2 to publish to .Mac. This alert appears:

> **Important Notice**
> We apologize for the inconvenience, but the ability to order books and prints is no longer supported in iPhoto 2. Please upgrade to a newer version of iPhoto to order these products

Solution

Upgrade to a newer version of iPhoto. For example, iPhoto included with iLife '08 lets one publish pictures to .Mac via iPhoto.

Note: Earlier Macs that do not support iLife '08 can use iPhoto from iLife '04, '05 or '06 to publish (upload) pictures to .Mac.

Additional information

See "iPhoto 2: Ordering books and prints not supported".

Final Cut Pro: Intermittent stream breaks with JVC GY-HD250U

This article has been archived and is no longer updated by Apple.

Issue

When capturing from the JVC GY-HD250U camcorder, it's possible that there may be occasional breaks in the data stream, similar to what would be expected if the recording had been stopped, and then started again. If this occurs, Final Cut Pro will treat such breaks as a timecode break. Depending on the setting chosen in the "On timecode break" pop-up menu in the General tab of User Preferences, Final Cut Pro may abort capture, or may begin capturing a new clip at that point.

Solution

If this issue occurs, try the following steps to remedy the situation:

1. Check to see if your camcorder has been upgraded to the latest firmware available from JVC: http://pro.jvc.com/pro/attributes/HDTV/soft/200_upgrade/index.html
2. Test with a new tape.
3. It may be necessary to use a cleaning tape. Consult your JVC GY-HD250U Operator's Manual for details.

You can shorten the amount of lost record time due to this issue by lowering the Pre-roll value in Device Control Presets.

For more information about the topics discussed in this document, refer to the Final Cut Pro User Manual, available under the Help menu in Final Cut Pro.

Mac OS X 10.5: Large file downloads timeout and need to be restarted

This article has been archived and is no longer updated by Apple.

Issue or symptom

When using Mac OS X 10.5 to download large files, a timeout may occur after downloading a portion of the file. When restarting the download, the cycle may repeat. After several download restarts, the file may be fully downloaded.

This can happen with earlier Juniper NetScreen Internet router devices.

Solution

Upgrade to a later (newer) third-party router, or use an AirPort base station.

Additional information

For more information, see this Juniper support article.

Mac OS X 10.4: Calculator, Unit Converter widget, and Stocks widget may not work correctly

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Calculator application, the Unit Converter Dashboard widget, and the Stocks widget rely on data from the Internet that changes daily. In some cases, they may appear to have stopped working even if there is an active Internet connection:

- When using the Calculator application, nothing may happen when choosing Currency from the Convert menu.
- When using the Unit Converter widget, the message "Data unavailable" or "Update failed" may appear when choosing Currency from the pop-up menu.
- When using the Stocks widget, stock values may be blank and the message "Error retrieving chart" may appear.

Solution

Download and install the Mac OS X 10.4.11 Update or later.

Published Date: Feb 20, 2012

iSync, Mac OS X 10.4: Issues with iSync and Palm device if Palm Desktop not installed

This article has been archived and is no longer updated by Apple.

Issue or symptom

iSync may be unresponsive, or may not open at all, if Palm devices have been added to iSync but Palm Desktop software is not installed. This article applies to Mac OS X 10.4 through 10.4.11.

Solution

1. Quit all running applications.
2. From the Finder's **Go** menu, choose **Go to Folder**.
3. Go to this folder (type or paste the following):
   `~/Library/Application Support/SyncServices/`
4. Delete the folder named "Local". **Note**: Do not remove any other folders from the SyncServices folder, if you see others.
5. Reinstall Palm Desktop 4.2.1 or later software before opening iSync.

Additional information

For more information about using Palm devices with iSync, see this article. If your device supports Bluetooth, see this article.

iSync: No alert when syncing with full Nokia N90 phone

This article has been archived and is no longer updated by Apple.

Issue or symptom

When exceeding a Nokia N90 phone's usable memory, the device may display "Phone memory full, please delete some data". However, iSync may not give an indication that the phone's memory is full when initially synchronizing the device.

In this situation, if sync session is initiated with iSync you may notice that some events or contacts may not be synced to the phone.

Solution

Reduce some of the data stored on the phone to increase the available memory.

Once there's an acceptable amount of free space on the phone, it will synchronize as expected via iSync.

iMac: Using Floppy Disk-Based Installers

This article tells how to install software that comes on floppy disks onto an iMac computer.
This article has been archived and is no longer updated by Apple.
If you have not already done so, do take the time to contact the manufacturer to see whether they publish their software on compact disc. Few companies continue to distribute their software solely on floppy disks. As programs have grown in size and installers have become more sophisticated, the CD-ROM has almost entirely replaced the floppy disk as the preferred medium for the distribution and installation of software.

Nevertheless, if the software is simply not available on CD, consider the following possible alternatives:

A. Install the program over a network.

If your iMac is connected via ethernet to another computer that has a floppy disk drive, it may be possible to perform a network installation of the software from that computer. Not all software installers will permit this kind of installation. To set up a network installation, proceed as follows:

1. Create an empty folder on the hard drive of the computer that has the floppy disk drive. We will call it "Net Install," though the name is not important.

2. Insert the floppy disk and drag its icon on top of the Net Install folder. Do not open the floppy and drag its contents; rather, drag the whole floppy disk icon. The contents of the floppy will then be recreated inside the Net Install folder, in a subfolder of the same name as the floppy. Repeat this step for every other floppy in the installation set. Afterward, the Net Install folder will contain a subfolder representing each floppy disk in the set.

3. Open the Net Install folder, then open the folder representing the first floppy disk in the set. If you see an installer and an installer script inside, move them both out of that folder and into the root level of the Net Install folder, alongside the other floppy disk folders you created. If you do not see a separate installer script, it may be necessary to leave the installer where it is for this to work. Try it both ways if necessary.

4. Set up the Net Install folder to be shared over the network, then go to the iMac and log on to that shared volume. Once mounted on the iMac's desktop, you can open the Net Install folder and double-click the program installer within to begin installation on the iMac. Alternatively, you can drag-copy the whole Net Install folder to the iMac's hard drive, then run the installer from there. If, during the course of the install, you are asked to insert a floppy, cancel the install and try moving the installer into or out of the root level of the Net Install folder, as per step 3. Then try installing again. If that too fails, a network installation is probably not possible with that software.

B. Create disk images on another computer.

This is a variant of the network install, except that a disk image of a floppy contains ALL of the contents of the original floppy, including invisible files. The previous method excludes those files, the lack of which can cause an installation to fail.

Disk images are created with utilities like Disk Copy, from Apple Computer, or ShrinkWrap, from Aladdin Systems. Once created, a disk image can either be opened over the network or copied first to the iMac computer's hard disk, then opened from there. For software that comes on multiple floppy disks, ensure that all of the disk images that represent them have been mounted before initiating the install. For more information on the creation and use of disk images, refer to the instructions provided with the disk image utility.

C. Obtain a USB device that can use floppy disks. There are a variety of external storage solutions available for the iMac, some of which can use floppy disks.

Final Cut Studio: Format new hard disks as Mac OS Extended for best performance

This article has been archived and is no longer updated by Apple.

Hard disk drives are sometimes sold pre-formatted in in a disk format other than Mac OS Extended, and may not perform ideally with Final Cut Studio applications. Other disk formats, such as FAT32, Mac OS Standard (HFS), New Technology File System (NTFS) and UNIX File System (UFS) may not provide ideal results.

Hard disks installed in your computer, or connected externally via FireWire should be formatted using the Mac OS Extended disk format, also known as HFS Plus.

Formatting a hard disk is usually done when it's brand new. If you want to reformat a disk that already contains data, be sure to back up the data to another disk beforehand. **Notice:** Reformatting a hard disk will permanently erase all of the data on it.

Tip: You can check the format of a hard disk by clicking its icon in Finder and then choosing **Get Info** from the **File** menu. The format is displayed in General information in the Info window.

To format a hard disk as Mac OS Extended

1. Open Disk Utility from the Utilities folder in Applications.
2. Select the name of your hard disk in the left column of the Disk Utility window so that it's highlighted.
3. Click **Erase** to show the formatting options pane.
4. From the **Volume Format** menu, choose **Mac OS Extended**. (For best performance, do **not** select the "Journaled" option on disks that will primarily be used for Final Cut Studio media input/output.)
5. Click **Erase** (in the lower-right corner).

Mac OS X 10.5: Unable to quit running application or restart; "The application cannot be launched, -600" alert

This article has been archived and is no longer updated by Apple.

Issue or symptom

When attempting to quit an open (running) application in Mac OS X 10.5, you may notice the application still appears in the Dock as if it is running. The application may be unresponsive.

If you try to open the application again, you may receive an alert such as this:

> "The application (name) cannot be launched. -600."

...where "(name)" is the affected application's name.

If this happens, you may also not be able to shut down or restart your computer.

This can happen if an incompatible version of Intego ContentBarrier is installed.

Solution

Update to the latest version of Intego ContentBarrier.

This document will be updated as more information becomes available.

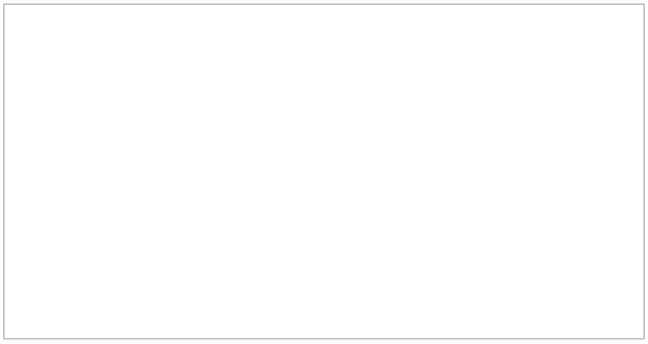
Update to iOS 12

Enjoy a faster and more responsive experience as well as fun new features, like Memoji and Camera Effects.

Get iOS 12



Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

Watch. And Learn.

Videos designed to make your experience shine. Our YouTube channel is live, and we're adding new How-to and tips & tricks content weekly to answer your most asked questions.

Logic or GarageBand may quit unexpectedly when starting with Mac OS X 10.5 Leopard if Melodyne is installed

This article has been archived and is no longer updated by Apple.

Issue or symptom

Logic Pro/Express and GarageBand may quit unexpectedly when starting on a computer with Mac OS X 10.5 Leopard if Melodyne 3.x is also installed.

Solution

The issue is caused by Melodyne's ReWire support. To resolve it:

1. Go to `/Library/Application Support/Propellerhead Software/Rewire`. Move the files "MelodyneRewireDevice" and "MelodyneRewireDevice.plugin" to the Trash.
2. Go to `/Library/Application Support` and move the alias "MelodyneRewireDevice" to the Trash.

For further information on this issue, and general Melodyne support in Leopard, go to the Celemony site.

Additional information

The Melodyne application, and plug-in will both continue to function after these steps are performed. However, ReWire connection between Melodyne and other applications will not be possible.

iPod touch: Don‘t restore an iPhone backup to an iPod touch

This article has been archived and is no longer updated by Apple.

Issue or symptom

Restoring an iPhone backup to an iPod touch may result in unexpected behavior on the iPod touch (such as the device resetting repeatedly).

Solution

If you have restored an iPhone backup to your iPod touch, restore the iPod touch to factory condition, and then select the correct backup to restore your settings.

If you experience difficulty restoring your iPod, then see this document for steps to put your iPod touch into recovery mode.

Use iTunes to update to iPod touch Software 1.1.3 or later to prevent this issue from occurring.

"Some of the required files are missing" error when opening iTunes 7.5 or Error -2093 error when opening QuickTime Player 7.3

This article has been archived and is no longer updated by Apple.

Issue or symptom

After updating to QuickTime 7.3 and iTunes 7.5, the following error message may appear when opening iTunes:

> "Some of the required files are missing."

When opening QuickTime Player, an error -2093 may appear.

Solution

Remove any copies of iTunesSetup.exe that are currently on your hard drive. Then, download and install a fresh copy of the iTunes 7.5 installer (which includes QuickTime 7.3) from here:
http://www.apple.com/itunes/download/

Apple FireWire Kit: Description

This article describes the Apple Firewire Kit for the Power Macintosh G3 computer. More information on Firewire is available at http://www.apple.com/firewire/ .
This article has been archived and is no longer updated by Apple.
The Apple FireWire Kit lets you use your FireWire-based digital video (DV) camcorder to produce professional-quality digital video more easily and less expensively than ever before. It also provides an excellent way to get in on the ground floor of the latest trend in digital interfaces: FireWire, an advanced cabling, connection, and communications standard originally conceived by Apple engineers and specifically developed to meet the needs of the rapidly converging worlds of personal computing and consumer electronics.

The Apple FireWire Kit consists of a three-port FireWire PCI card, a 2-meter FireWire cable, and Adobe Premiere plug-ins that support capture, edit, and play back, as well as to export to tape. With the addition of a DV camcorder or deck with a FireWire port and a QuickTime-based video-editing application, the Apple FireWire Kit gives you a great way to get outstandingly crisp, clear digital video footage into your Macintosh.

Working with digital video avoids the degradation in quality inherent to earlier, analog-based video cards, which required you to convert video data between digital and analog formats. And the high-speed, high-capacity nature of FireWire, not to mention its flexibility and scalability is already prompting more and more hardware developers to adopt this standard--which means that you may soon be able to choose from a wealth of advanced digital devices, from cameras to scanners to printers.

Technical specifications:
- Supports 200-Mbps bandwidth
- Supports asynchronous data transfer, as well as isochronous data transfer, which provides guaranteed bandwidth for your video and audio data streams
- Supports flexible configuration options, including daisy-chaining and branching for peer-to-peer implementations (FireWire does not allow closed-loop connections)
- Allows for the addition or removal of devices while the connection is active

The user must supply:
- A FireWire-based DV camcorder or deck
- A QuickTime 3-based video-editing application that supports video import and export

This option includes:
- FireWire PCI card with three ports
- 2-meter FireWire cable (6-pin to 4-pin)
- FireWire system software extensions
- Two plug-ins for Adobe Premiere 4.2
--DV Device Control allows you to control your camera remotely
--DV Export enables you to record your edited footage onto tape
- QuickTime 3 Pro software

The Apple FireWire Kit works with any Power Macintosh G3 desktop or minitower computer running Mac OS 8.1 system software.

For additional information on FireWire, see the following knowledgebase article:

Mac OS X 10.5, iChat: Unable to participate in some chats on a PowerPC G4 867Mhz Mac

This article has been archived and is no longer updated by Apple.

Issue or symptom

You may be unable to participate in a video or audio chat in Mac OS X 10.5 Leopard on PowerPC-based Macs that have an 867Mhz G4 processor. The iChat **Video** menu may not appear, and under the Connection Doctor's Capabilities tab your computer may be listed as "unable to participate in a video conference" due to bandwidth/network issues.

You may also receive an alert when you attempt to respond to a video conference such as:

> "NAME has invited you to participate in a Video Chat, but your computer does not support video conferencing."

(Where NAME is the name of the buddy that invited you to the video chat.)

Solution

Download and install Mac OS X 10.5.2 or later.

About the security content of Safari 3 Beta Update 3.0.4

This article has been archived and is no longer updated by Apple.

This document describes the security content of Safari 3 Beta Update 3.0.4 for Microsoft Windows XP or Vista.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Safari 3 Beta Update 3.0.4

- **Safari**

  CVE-ID: CVE-2007-4692

  Available for: Windows XP or Vista

  Impact: An issue in Safari Tabbed browsing may lead to the disclosure of user credentials

  Description: An implementation issue exists in the Tabbed browsing feature of Safari. If HTTP authentication is used by a site being loaded in a tab other than the active tab, an authentication sheet may be displayed although the tab and its corresponding page are not visible. The user may consider the sheet to come from the currently active page, which may lead to the disclosure of user credentials. This update addresses the issue through improved handling of authentication sheets. Credit to Michael Roitzsch of Technical University Dresden for reporting this issue.

- **Safari**

  CVE-ID: CVE-2007-1351, CVE-2007-1352, CVE-2007-2754

  Available for: Windows XP or Vista

  Impact: Multiple vulnerabilities in FreeType v2.2.1

  Description: Multiple vulnerabilities exist in FreeType v2.2.1, the most serious of which may lead to arbitrary code execution. This update addresses the issue by updating FreeType to version 2.3.5. Further information is available via the FreeType site at http://www.freetype.org/

- **WebCore**

  CVE-ID: CVE-2007-3758

  Available for: Windows XP or Vista

  Impact: Visiting a malicious website may lead to cross-site scripting

  Description: A cross-site scripting issue in Safari allows malicious websites to set JavaScript window properties of websites served from a different domain. By enticing a user to visit a maliciously crafted web page, an attacker may be able to get or set the window status and location of pages served from other websites. This update addresses the issue by providing improved access controls on these properties. Credit to Michal Zalewski of Google Inc. for reporting this issue.

- **WebCore**

  CVE-ID: CVE-2007-3760

  Available for: Windows XP or Vista

  Impact: Visiting a malicious website may lead to cross-site scripting

  Description: A cross-site scripting issue in Safari allows a malicious website to bypass the same origin policy by hosting embedded objects with javascript URLs. By enticing a user to visit a maliciously crafted web page, an attacker may cause the execution of JavaScript in the context of another site. This update addresses the issue by restricting the use of the javascript URL scheme and adding additional origin validation for these URLs. Credit to Michal Zalewski of Google Inc. and Secunia Research for reporting this issue.

- **WebCore**

CVE-ID: CVE-2007-3756

Available for: Windows XP or Vista

Impact: Visiting a malicious website may lead to the disclosure of URL contents

Description: Safari may allow a web page to read the URL that is currently being viewed in its parent window. By enticing a user to visit a maliciously crafted web page, an attacker may be able to obtain the URL of an unrelated page. This update addresses the issue through an improved cross-domain security check. Credit to Michal Zalewski of Google Inc. and Secunia Research for reporting this issue.

- **WebKit**

  CVE-ID: CVE-2007-4671

  Available for: Windows XP or Vista

  Impact: JavaScript on websites may access or manipulate the contents of documents served over HTTPS

  Description: An issue in Safari allows content served over HTTP to alter or access content served over HTTPS in the same domain. By enticing a user to visit a maliciously crafted web page, an attacker may cause the execution of JavaScript in the context of HTTPS web pages in that domain. This update addresses the issue by preventing JavaScript access from HTTP to HTTPS frames. Credit to Keigo Yamazaki of LAC Co., Ltd. (Little eArth Corporation Co., Ltd.) for reporting this issue.

- **WebKit**

  CVE-ID: CVE-2007-4698

  Available for: Windows XP or Vista

  Impact: Visiting a malicious website may lead to cross-site scripting

  Description: Safari allows JavaScript events to be associated with the wrong frame. By enticing a user to visit a maliciously crafted web page, an attacker may cause the execution of JavaScript in the context of another site. This update addresses the issue by associating JavaScript events with the correct source frame.

- **WebKit**

  CVE-ID: CVE-2007-4812

  Available for: Windows XP or Vista

  Impact: Visiting a malicious website may lead to arbitrary code execution

  Description: A buffer overflow exists in Safari's handling of the status bar. By enticing a user to visit a maliciously crafted web page, an attacker may cause arbitrary code execution. This update addresses the issue by re-implementing the status bar handling.

Published Date: Oct 11, 2016

Aperture: Applescript to access Aperture library generates an error under Leopard

This article has been archived and is no longer updated by Apple.

Issue or symptom

An AppleScript used to select a project in Aperture may generate the error message "Aperture got an error: Can't get project *'yourprojectname*"' when run on Mac OS X 10.5 Leopard. The same script runs without an error message on Mac OS X 10.4 Tiger.

Solution

This may happen if you do not specify the library to be used in your script. This has always been the best practice, but it was not mandatory under OS X 10.4.x. For example, this script fragment will generate the error message:

```
tell application "Aperture"
      activate

      set x to name of every project
      choose from list x with prompt "Select a project"
      set ap_proj to item 1 of result
      set ap_proj to project ap_proj

end tell
```

The solution is to add the following line to the script, on the line below `tell application "Aperture"`:

```
tell library 1
```

You will also need to add an additional `end tell` statement on the line before the existing `end tell`. So the resulting script fragment will look like this:

```
tell application "Aperture"
      tell library 1
        activate

        set x to name of every project
        choose from list x with prompt "Select a project"
        set ap_proj to item 1 of result
        set ap_proj to project ap_proj
     end tell
end tell
```

Published Date: Feb 20, 2012

Final Cut Pro 6.0.2: QuickTime 7.3 or later is required

This article has been archived and is no longer updated by Apple.

Issue

Final Cut Pro 6.0.2 requires QuickTime 7.3. If you open Final Cut Pro 6.0.2, and you don't have QuickTime 7.3 or later, you will see an alert message, such as the following:

This system does not meet the following minimum requirements:

- Final Cut Pro requires that your system have QuickTime 7.3.0 installed; this system has QuickTime 7.2.1 installed.

Note: If you previously updated to QuickTime 7.3, and then upgraded your computer from Mac OS X 10.4 Tiger to Mac OS X 10.5 Leopard, it's possible that QuickTime 7.2.1 may have been installed with Leopard, and you will need to update QuickTime to 7.3 again.

Solution

Choose **Software Update** from the **Apple** menu to update to QuickTime 7.3 or later. Alternately, you can download QuickTime from the QuickTime Web site.

Published Date: Feb 20, 2012

Mac OS X 10.5: HP LaserJet 1200 prints "error" message at end of each print job

This article has been archived and is no longer updated by Apple.

Issue or symptom

An "error reporting" message may be printed after each print job sent from Mac OS X 10.5 to an HP LaserJet 1200 printer.

Solution

As a workaround, you can turn off error reporting in Mac OS X 10.5:

1. Open Terminal (in /Applications/Utilities).
2. Execute this command on a single line:

```
defaults write com.apple.print DoPostScriptErrorHandler NO
```

Note: To re-enable print error reporting, you can execute this similar command in Terminal:

```
defaults delete com.apple.print DoPostScriptErrorHandler
```

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iTunes 7.5 for Mac: Unable to change a smart playlist from "Match All" to "Match Any"

This article has been archived and is no longer updated by Apple.

Issue or symptom

If you edit a Smart Playlist to change "Match all" to "Match any," and then go back to edit the list again, the Match option has reverted to Match all. If you click OK without changing the Match option, the Smart Playlist will change to reflect Match all.

Solution

Use Software Update to update to iTunes 7.6 or later to resolve this issue.

If you're not able to update and you want to "Match any" of the rules, then edit the Smart Playlist again and choose "Match any" again.

Published Date: Feb 20, 2012

iTunes 7.5 for Mac: Criteria of "Video Kind" in Smart Playlist not saved

This article has been archived and is no longer updated by Apple.

Issue or symptom

Creating a new Smart Playlist or editing an existing playlist with the criteria of "Video Kind" will result in no matches from your iTunes Library because the rule for the Smart Playlist will not be saved.

If you try to edit the Smart Playlist, the "Match the following rule" field will be blank or empty after you click OK. Any additional criteria that is part of the Smart Playlist will remain, but they will produce results from the entire library, not just videos.

Note: Any Smart Playlists that were created prior to updating to iTunes 7.5 will continue to work as long as you don't try to edit the Smart Playlist.

Solution

Use Software Update to update to iTunes 7.6 or later to resolve this issue.

Published Date: Feb 20, 2012

iMac: Power Supply Specifications

This article provides the power specifications for the iMac, with the exception of the iMac (Summer 2000). Refer to the the Apple Spec database online at http://www.info.apple.com/applespec/applespec.taf for information on that model.
This article has been archived and is no longer updated by Apple.
These same power supply specifications are listed in the Mac OS Info Center on your computer's hard disk.

The iMac's power supply is rated to 240 volts and has auto-switch capability.

AC Line Input

- Line voltage: 100-240 volts alternating current (V AC) wide range
- Frequency: 50-60 Hz
- Power: 220 volt-amperes (VA) maximum continuous

DC Power

- Continuous output: 80 watts (W)

Output voltage Maximum current
+5 V 14.6 A (1)
+5 V (trickle) 0.1 A
+3.3 V 12.0 A (1)
+12 V 1.5 A
-12 V 0.2 A

(1) Not more than 70 W total combined power.

Power Requirements for Devices You Can Connect

Universal Serial Bus (USB)

- Computer: 500 milliamperes (mA) per device based on USB 1.0 Specifications
- Keyboard: 100 milliamperes (mA) per device based on USB 1.0 Specifications
- Microphone
  Voltage: +5 V
  Current: 20 mA
  Power: 100 mW

Mac OS X 10.5: Unable to manually establish dial-up connection via AirPort base station

This article has been archived and is no longer updated by Apple.

Issue or symptom

After you install Mac OS X 10.5, you may not be able to manually connect to a dial-up Internet connect through an AirPort base station.

Solution

Either configure your AirPort base station to automatically connect, or, if you wish to manually control the connection, connect your telephone line directly to your computer's built-in modem or an Apple USB modem and use it instead, if available.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Mac OS X Server version 10.5.1: Virtual mail users require additional short name to become active

This article has been archived and is no longer updated by Apple.

Issue or Symptom

Virtual email users may experience rejected emails by the server until the user short name is added.

Solution

In order to get the virtual email domain to accept emails, enter the short name of the virtual email and the short name of the user.

For example, John Smith's email address is johnsmith@virtualdomain.com. Be sure to include the short name johnsmith and johnsmith@virtualdomain.com.

This document will be updated as more information becomes available.

Power Macintosh G3: PATHWORKS error on startup

I have a G3-based Macintosh computer that I am setting up with DIGITAL PATHWORKS. When the DECnet line setting is set to 'ethernet', I get the following message from PATHWORKS on startup:

"error => could not find Ethernet driver"

Is PATHWORKS supported on G3-based Macintosh computers?
This article has been archived and is no longer updated by Apple.
This is a known issue between PATHWORKS for Mac and the ethernet drivers for G3-based Macintosh computers. PATHWORKS will not function when the DECnet line setting is set to 'ethernet' on these machines.

Customers using PATHWORKS for Mac should also be aware of the following developments at Compaq/DIGITAL:

- Compaq/DEC discontinued support for PATHWORKS for Mac as of 7/1/1998.
- Compaq/DEC will not be testing PATHWORKS for Mac for Year-2000 (Y2k) compliance.

PATHWORKS supports three types of DECnet connections:
- ethernet
- AppleTalk
- modem

Although DECnet-over-ethernet connections are known not to work, DECnet-over-AppleTalk (including AppleTalk over ethernet) or modem connections may still be possible. Apple has not done any testing, and we are not aware of any testing done by Compaq/DEC before they discontinued support of their product.

The current information is true for G3 computers up to and including Mac OS 8.1. The Mac OS 8.5 ethernet driver for the G3 now provides support for the "eadr" resource, which allows the "ethernet" line setting for PATHWORKS to be used.

Although Apple has added support for this resource, we have done no testing of PATHWORKS on Mac OS 8.5.

Published Date: Feb 20, 2012

Final Cut Pro 6: Log and Transfer may fail if "FxFactory" is installed

This article has been archived and is no longer updated by Apple.

Issue

You may be unable to transfer P2 or AVCHD media in the Final Cut Pro 6 Log and Transfer window if FxFactory is installed.

Solution

This issue is addressed in FxFactory 2.0.1.

For more information about FxFactory 2.0.1, visit the Noise Industries web site.

Final Cut Pro 6: About the Log and Transfer Window

This article has been archived and is no longer updated by Apple.

You can use the Log and Transfer window to transfer footage recorded on Panasonic P2 cards and other non-tape-based media to your computer.

Historically, video footage has been recorded on videotape. As digital acquisition quickly replaces analog technology, camcorders are starting to record footage as files on non-tape-based media such as hard disks, solid-state cards, and optical discs. Final Cut Pro can transfer file-based media to your computer using the Log and Transfer window.

For information about using the Log and Transfer Window, refer to the document, **HD and Broadcast Formats**, available under the Help menu in Final Cut Pro. You can also download the document (in PDF format) from the Apple Support site, here.

You can find more information in the "Final Cut Pro 6 Release Notes."

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iMac: Video RAM Expansion

This article provides specific technical information relating to the video RAM and upgrade capabilities of iMac.
This article has been archived and is no longer updated by Apple.
The iMac computer includes 2 MB of SGRAM for video on the main logic board. The video RAM can be expanded up to 6 MB by installing an additional 4 MB of SGRAM on a 144-pin SO-DIMM (small outline dual inline memory module).

The chips on the DIMM must be 3.3 V SGRAM chips. The speed of the SGRAM chip must be 100 MHz or greater, corresponding to a cycle time of 10 ns or less.

Increasing the size of the installed video RAM from 2 MB to 4 or 6 MB increases the maximum color depth available at the highest monitor resolutions. Any additional video RAM that isn't used for the current display mode is available to QuickDraw 3D applications for more data storage, such as textures, which results in faster 3D graphics performance.
Published Date: Feb 20, 2012

Final Cut Pro 6.0.2: Render quality settings and render times

This article has been archived and is no longer updated by Apple.

Issue

Render times for a given project can be different in Final Cut Pro 6.0.2 than in previous versions. If your project contains Master Templates or Motion projects, this difference may be attributed changes in the Quality setting for Master Templates and Motion Projects.

Solution

Depending on settings in preferences, Final Cut Pro 6.0.2 may render Motion templates and Motion projects at Best quality, which can take a longer time than if Quality is set to Normal or Draft. You can change this setting for Master Templates and Motion projects in the **Render Control** pane of **User Preferences**.

When the Quality setting for Master Templates and Motion Projects is set to Normal, Final Cut Pro 6.0.2 renders your templates at the same quality seen when rendering the templates at Normal quality in Motion. If you determine that the rendering quality is not high enough, as might be the case when your Motion templates or projects use render-intensive features such as 3-D text rotation or 3-D particles, you can change the render quality to Best. However, rendering Motion templates and projects at Best quality can greatly extend the time it takes to render your movie.

Note: Selecting the "Always Use Best Quality When Rendering Movies" checkbox in the Render Control pane of User Preference sets Final Cut Pro to always render your Motion templates and projects at Best quality during export or rendering to disc, no matter which quality you selected from the Quality pop-up menu. To render your Motion templates and projects at the Normal or Draft quality, be sure this checkbox is not selected.

Xserve RAID: Error when rebuilding parity

This article has been archived and is no longer updated by Apple.

Issue or symptom

The Xserve RAID utility 'Rebuild Parity Data' may quit unexpectedly and the following error message may appear in the event log:

```
Data Was Lost During A Rebuild Operation
```

Solution

You may safely ignore this error message. Simply repeat the parity rebuilding process until it successfully completes.

Published Date: Oct 11, 2016

Final Cut Pro 6.0.2: Master Templates in updated projects may require adjustment

This article has been archived and is no longer updated by Apple.

Issue

In Final Cut Pro 6.0.2, if you open a project that was created in an earlier version of Final Cut Pro 6, Master Templates used in the project may appear to be scaled differently than expected.

For example, this can occur if your project uses a High Definition format Master Template in a Standard Definition sequence.

Solution

In such cases, you can resize the Master Template instances in your project so that they are scaled correctly. Alternately, you may wish to replace the Master Templates used in your project.

About the Mac OS X 10.5.2 Server update

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X Server version 10.5 or version 10.5.1 to 10.5.2.

Important: Read before installing

- The installation process should not be interrupted, *even if the progress bar remains unchanged for several minutes*. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Support Downloads to update.
- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank. If you need to change your password, see this article.
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. (This doesn't apply to normal software installation.)
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server version 10.5.2. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are three ways to update to Mac OS X Server 10.5.2: Use Software Update, install from a standalone installer, or install on a remote computer via the `softwareupdate` command-line utility.

Software Update installation

Software Update may have referred you to this document. For more information on this feature, see this article. Because some updates are prerequisites for others, you may need to use Software Update more than once to obtain all available updates.

Standalone installer

Download and manually install the update. The installer is available from Apple Support Downloads. This a useful option when you need to update multiple computers but only want to download the necessary update once.

Remote installation

If you need to install the update on a remote computer, you can do so using the `softwareupdate` command-line tool.

What's included?

This update delivers several improvements, including:

Software Update Server
Addresses an issue which could prevent Software Update Server from working properly on a system that had been upgraded from Mac OS X Server 10.4.x.

Mail Server
Addresses an issue in which Virtual Mail users were required to have short names configured in order to become active.

Password Server
Addresses an issue that could block object changes from being propagated to Open Directory replica servers.

The Mac OS X Server 10.5.2 update also includes improvements provided in the Mac OS X Server 10.5.1 update.

Xsan: Synchronizing clocks is important

This article has been archived and is no longer updated by Apple.

Xsan relies on each Xsan node having synchronized clocks. Therefore, each Xsan node should be configured to share a common Network Time Protocol Server. You can configure this setting in Date & Time preferences, in System Preferences.

Note: For computers running Mac OS X 10.4.x, see the this article.

How to identify audio file types and formats of regions in Logic

This article has been archived and is no longer updated by Apple.

Logic Pro/Express supports several audio file types and formats. These fall into three general types:

- PCM audio files (such as AIFF, WAV and SD2).
- Compressed audio files (such as AAC and MP3).
- Looping audio files (such as Apple Loops and ACID Loops)

Additionally, audio files may be different channel formats, such as mono, split stereo, interleaved stereo, or surround. You can easily tell at a glance what type and format a region in your arrangement is, by the glyph that follows its name:

Glyph	What it represents
	This glyph represents a mono PCM audio file
	This glyph represents a split stereo PCM audio file
	This glyph represents an interleaved stereo PCM audio file
	This glyph represents a surround PCM audio file (Logic Pro only)
	This glyph represents a mono compressed audio file
	This glyph represents a stereo compressed audio file
	This glyph represents a mono looping audio file
	This glyph represents a stereo looping audio file

This glyph represents a recording you've made where you've enabled "Follow Tempo" in the region parameter box.

You can find more detailed information about your audio regions, including bit depth, sample rate and specific file type in the Audio Bin.

Mac OS X 10.5: Finder may restart when trying to change file permissions

This article has been archived and is no longer updated by Apple.

Issue or symptom

When trying to change file permissions in a Finder Get Info window, the Finder itself may restart after the "+" button is clicked.

This issue can affect accounts that were migrated from Mac OS X 10.4 Tiger.

Products affected

- Mac OS X 10.5

Solution

1. Log in as an administrator.
2. Open Terminal (in /Applications/Utilities).
3. Type the following commands, each on a single line and followed by Return (enter an admin password when prompted):

```
sudo dscl . create /Groups/username GroupMembership username

sudo dscl . change /Groups/username RecordName username _username
```

Replace the italicized "*username*" with your account username (which is also the name of the user's Home folder, in the Users folder). Remember to include the underscore "_" before your user name in the second command.

If you have more than one account on the computer affected by this issue, you should run these two commands again for each account, substituting with the appropriate user name each time.

This document will be updated as more information becomes available.

iMac: Changing Internet Setup Assistant Configurations

This article explains how to re-enter your Internet Setup Assistant information.
This article has been archived and is no longer updated by Apple.
Internet Setup Assistant automates the creation of configurations, rather than having to go to each individual control panel and manually enter information. If you have already created a configuration though, and need to make changes, use the following guide to determine where the information is stored.

Internet Setup Assistant modifies the following control panels:

AppleTalk - The settings in this control panel determine how your computer will connect to an AppleTalk (EtherTalk) network or printer. The AppleTalk control panel also allows the connection to be active on a remotely-connected network (Remote Only).

Dial Assist - The settings in this control panel determines what area code you are calling from, if you need to dial a 9 to reach an outside line and other options specific to your connection.

Modem - The settings in this control panel determine what modem your computer uses and how it is used.

Remote Access - The settings in this control panel determine what number your computer dials, what username and password is used and other options specific to your connection.

TCP/IP - The setting in this control panel determines the network connection information, such as domain name, domain name service, router (gateway) address, subnet mask and other options specific to your connection.

These control panels comprise the user interface to Open Transport networking, the name given to modern networking in the Mac OS.

After locating the appropriate control panel to be modified, open the control panel, and note the name of the control panel. For example, "TCP/IP (Work)" appears in the title of the window. This determines what configuration is active. Making changes while the configuration is active, then closing the control panel and saving changes, modifies the configuration.

To learn more about each control panel, use Balloon Help found under the Help Menu while the control panel is open or press the help button on the keyboard.

For additional information see the following articles:

Qloud plug-in may cause iTunes to freeze or quit

This article has been archived and is no longer updated by Apple.

Issue

In some cases, having the Qloud plug-in for iTunes for Windows installed can cause iTunes to freeze or unexpectedly quit when opened. Follow the instructions below to remove the plug-in and resolve this issue.

Solution

Remove the Qloud plug-in using the steps below:

1. Quit iTunes.
2. Navigate to the Qloud plug-in folder typically located in the `C:\\Program Files\\iTunes\\Plug-Ins\\Qloud` folder as shown below:

3. Open the `iTunesQLoudSetup` application. If you see the security warning shown below, click Run.

4. When the Qloud Setup application opens, select the uninstall option shown below:

5. When the uninstall is complete, delete the Qloud folder located at `C:\\Program Files\\iTunes\\Plug-Ins\\`

Compressor/Apple Qmaster versions 2.3 and earlier and version 3.0 not supported on Mac OS X 10.5 Leopard

This article has been archived and is no longer updated by Apple.

Issue or symptom

Compressor/Apple Qmaster versions 2.3 and earlier and version 3.0 are not supported on Mac OS X 10.5 Leopard.

Solution

Compressor and Apple Qmaster 2.3.1 and later or version 3.0.1 or later are supported on Mac OS 10.5 Leopard. Use Software Update to ensure you have the latest updates.

Aperture sometimes quits unexpectedly after upgrade to Mac OS X 10.5 Leopard

This article has been archived and is no longer updated by Apple.

Issue or symptom

Aperture sometimes quits when starting up after you install Mac OS X 10.5 Leopard.

Solution

This can happen if you use Aperture 1.5.4 or earlier. Update to Aperture 1.5.6 or later to resolve this issue. You can get the Aperture 1.5.6 update here. Additional information about the Aperture 1.5.6 update can be found here.

MacBook Pro (Late 2007): Display issues (shimmering) after DVD restore

This article has been archived and is no longer updated by Apple.

Issue or symptom

A MacBook Pro (Late 2007, 2.4/2.2GHz) computer may have display issues or shimmering, if it is restored using the DVDs that came with the computer.

Solution

These issues can be corrected by applying the most recent software updates available for this platform.

To apply these updates, perform the following steps.

1. From the **Apple** menu in the upper left corner of the screen, select Software Update.
2. Click the **Install** button and follow the on-screen instructions to install the latest Mac OS X software updates for your computer.

Mac OS X Server: Determining Hardware Ethernet Address

How to determine the hardware ethernet address of a Mac OS X Server computer.
This article has been archived and is no longer updated by Apple.

Mac OS X Server 10.x

1. Open the Apple System Profiler application found at /Applications/Utilities.
2. Look in the Network Overview of the System Profile to find your Mac Address.

On Mac OS X Server 1.x,

1. Open the Terminal application.
2. Type: `netstat -I en0`
   Note: This assumes en0 is the Ethernet interface.
3. Press Return

The hardware Ethernet address is located in the Address column of the output.

If the computer is connected to a NetInfo network using broadcast binding, the hardware address and owner of the machine can be determined by typing the following command:

```
nidump -r /machines .. > machines.txt
```

The file machines.txt may then be searched for a person's name, IP address, or hardware Ethernet address.

.Mac Sync: Last sync incorrectly noted as "Today"

This article has been archived and is no longer updated by Apple.

Issue or symptom

In Mac OS X 10.5 Leopard's .Mac preferences (in System Preferences), your last sync may incorrectly be noted as having occurred "Today", even if you have not synced yet today.

Solution

If you sync again, the Last Sync notice in .Mac preferences will be updated as expected. If you have enabled displaying Sync Status in the Menu bar, the Sync menu item will show the last sync date correctly.

This document will be updated as more information becomes available.

Motion 3: Text on a Path - Resolving glyph flipping

This article has been archived and is no longer updated by Apple.

Issue

In Motion 3, text on a path is possible even when that path is a 3D curve. When text follows a 3D path in this fashion, the glyphs tend to automatically "point up" so that they stay oriented with the global up direction. This behavior simplifies working with text on 3D curves.

In some cases you will want the glyphs to stay upside-down as they follow a path, rather than flipping over to point upwards.

The following illustration shows a case where automatic glyph-flipping is not desired.

We can see that the artist intended the text to follow the curve upward through the arc, but instead of the letters remaining upside-down, they flip over and look backwards. As the letters pass where the path aligns with the vertical axis, they flip to point upward, rather than just flowing with the path in a simple fashion.

Solution

This behavior can be controlled by adding a couple of points to the curve and by flipping the normal for curve points where text is upside-down.

In the illustration below we can see the same project as above has been improved by adding control points to the curve at the inflection points (Note the new points on the curve where the path goes vertical).

After adding new points to the curve, control-click on the first point where the text is flipping, and choose **Flip Normal** from the shortcut menu. Follow along the curve, and Flip Normals for other curve points where you want the text upside-down.

MacBook (Late 2007): Using the appropriate software restore DVD

This article has been archived and is no longer updated by Apple.

Issue or symptom

If the wrong software restore DVDs are used with the MacBook (13-inch Late 2007), you may experience issues including, but not limited to, the Ethernet and DVI ports not functioning correctly or intermittent video.

Solution

In the event the computer needs to be restored to factory settings, or an 'Archive and Install' needs to be performed, it is important to use the software restore DVDs included with the MacBook (13-inch Late 2007).

The MacBook (13-inch Late 2007) requires the Mac OS X 10.5 Leopard operating system. If the operating system needs to be reinstalled, you must use the discs that were included with the computer. Installing older versions of the operating system (such as Mac OS X 10.4 Tiger) is **not** recommended or supported.

About sRAW Images from Canon 40D Cameras with Apple photo applications

This article has been archived and is no longer updated by Apple.

Note: sRAW images are not supported from any camera. This document describes specific symptoms that may be seen with the Canon EOS 40D camera if the sRAW format is used.

The Canon EOS 40D camera offers an option to shoot images in a format called "sRAW", in addition to RAW and JPEG. As indicated on the Mac OS X 10.5 RAW Camera Support page, RAW images from the EOS 40D are supported. However, sRAW images are not supported. If you try to open sRAW images from the EOS 40D you may see some of the following issues:

- Attempting to open an sRAW image in Preview on Intel-based computers running Mac OS X 10.5 Leopard may cause Preview to quit unexpectedly.
- sRAW images opened with Preview on PowerPC-based or Intel-based computers running Mac OS X 10.4.11 Tiger will display garbage.
- sRAW images can be imported into iPhoto on Intel-based computers running Mac OS X 10.5 Leopard, but iPhoto may quit unexpectedly when you try to edit them.
- sRAW images can be imported into Aperture on Intel-based computers running Mac OS X 10.5 Leopard, but Aperture may quit unexpectedly when opened if there are sRAW images in the Aperture library.
- sRAW images can be imported into iPhoto and Aperture on PowerPC-based or Intel-based computers running Mac OS X 10.4.11 Tiger, but the images will display garbage.

MainStage: Controls sometimes flash black

This article has been archived and is no longer updated by Apple.

Issue or symptom

Some onscreen controls may flash black sporadically while playing.

Solution

This sometimes happens with the nVidia 5200 graphics card while in Performance or Full Screen mode. It is more likely to happen with display resolution settings of 1600 x 1200 or higher. It may help to lower the display resolution for the computer:

1. Choose **Apple** menu > **System Preferences**.
2. Choose **View** > **Displays**.
3. Click the "Display" tab in the Displays window.
4. Select a lower resolution setting for your display.

Boot Camp 2.0, Mac Pro: Windows XP Device Manager indicates that Intel(R) 5000 Series Chipset PCI Express devices may not be working properly

This article has been archived and is no longer updated by Apple.

Issue or symptom

With Boot Camp 2.0 and a Mac Pro, while viewing the contents of Device Manager in Microsoft Windows XP, Intel(R) 5000 Series Chipset PCI Express devices may be displayed with a yellow exclamation point icon:

When inspecting these devices, Device Status in the General tab may state "This device is not working properly because Windows cannot load the drivers required for this device (Code 31)".

Product affected

- Boot Camp 2.0, included with Mac OS X 10.5 Leopard
- Mac Pro
- Microsoft Windows XP (any version)

Solution

These indicators in Device Manager can be safely ignored. No additional drivers or other software is needed.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Important: Apple does not provide technical phone support for installing, using, or recovering Microsoft Windows. Support is available for using Boot Camp Setup Assistant, as well as installing or restoring Boot Camp software while booted into Windows. Support articles and discussions may also be available on Apple's support website.

Final Cut Pro 6: About 60 fps Drop Frame Timecode Support

This article has been archived and is no longer updated by Apple.

Issue

Final Cut Pro 6.0.2 has support for 60 fps drop frame timecode. This includes support for capture, export via QuickTime, FireWire device control, and third-party interfaces. 60 @ 30 timecode can also be displayed in drop frame mode.

If you edit a 60 fps clip with drop frame timecode into an empty sequence, the sequence's drop frame setting may not be set as expected.

Affected products

- Final Cut Pro 6.0.2

Solution

To correct the drop frame setting of the sequence, choose **Sequence > Settings**, click the Timeline Options tab, and then select the Drop Frame checkbox.

Note: Sequences that use 60 fps timecode have the Drop Frame option selected by default (as is the case with sequences that use 30 fps timecode). Many devices that use 60 fps timecode use non-drop frame timecode by default, so you may want to change your sequence settings (choose **Sequence > Settings**, click the Timeline Options tab, deselect the Drop Frame option, and then click OK).

Updating the Purchased playlist

This article has been archived and is no longer updated by Apple.

Selections you purchase from the iTunes Store are associated with your Purchased Playlist:

If you do not find your purchases there, don't worry—you can easily associate them with your Purchased playlist.

Step 1: Locate your iTunes Store purchases

There are a few ways to locate your purchases.

Get Info Method

You can identify iTunes Store purchases by viewing the Summary information.

1. Locate the song in the iTunes browser by clicking a Library icon such as Music, Movies, or TV Shows and then typing the purchased title (artist or album name) in the Search field.
2. When you locate the item in the iTunes browser, click once to select it.
3. From the **File** menu, choose **Get Info**.
4. Click the Summary tab. The purchaser's name and account indicate that the song was purchased from the iTunes Store:

File Format Method

You can identify iTunes Store purchases by the following file formats:

- Purchased AAC audio file
- Protected AAC audio file
- Purchased MPEG-4 video file
- Protected MPEG-4 video file

File formats are shown in the Kind column.

Tip: If you do not see the Kind column, select an iTunes Library such as Music, Movies, or TV Shows. Choose **View > View Options** and select Kind. Or you can also press the Control key and click (or right-click) a column heading to see a list of the view options.

Step 2: Select the purchased items

Select adjoining items by holding down the Shift key and clicking the first and last items.

Select multiple, non-adjoining items by holding down the Command key (on a Mac) or the Control key (on Windows) and clicking the purchased items.

Tip: To sort your Library by Kind, click the Kind column heading at the top.

Step 3: Associate the selected items with your Purchased playlist

Drag the selected items into your Purchased playlist or Control-click, and then choose **Add to Playlist > Purchased** from the shortcut menu.

The items should now display in your Purchased playlist.

TA25119_Updating_the_Purchased_playlist.pdf

About the security content of Java Release 6 for Mac OS X 10.4

This article has been archived and is no longer updated by Apple.

This document describes the security content of Java Release 6 for Mac OS X v10.4, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Java Release 6 for Mac OS X 10.4

- **Java**

  CVE-ID: CVE-2007-5862

  Available for: Mac OS X v10.4.10 and later, Mac OS X Server v10.4.10 and later

  Impact: A malicious webpage can remove or insert items in the keychain

  Description: An access check may be bypassed for Keychain updates. A specially crafted Java applet may be able to add or remove items from a user's Keychain, without prompting the user. This update addresses the issue through an improved access check. This issue does not affect systems running Mac OS X v10.5 and later. Credit to Bruno Harbulot of the University of Manchester for reporting this issue.

- **Java**

  CVE-ID: CVE-2006-4339, CVE-2006-6731, CVE-2006-6736, CVE-2006-6745, CVE-2007-0243, CVE-2007-2435, CVE-2007-3004, CVE-2007-3005, CVE-2007-3504, CVE-2007-3698, CVE-2007-3922, CVE-2007-4381, CVE-2007-5232

  Available for: Mac OS X v10.4.10 and later, Mac OS X Server v10.4.10 and later

  Impact: Multiple vulnerabilities exist in Java 1.4

  Description: Multiple vulnerabilities exist in Java 1.4, the most serious of which may lead to arbitrary code execution and privilege escalation. These are addressed by updating Java 1.4 to version 1.4.2_16. These issues are already addressed in systems running Mac OS X v10.5 and later.

- **Java**

  CVE-ID: CVE-2006-4339, CVE-2006-6731, CVE-2006-6745, CVE-2007-0243, CVE-2007-2435, CVE-2007-2788, CVE-2007-2789, CVE-2007-3004, CVE-2007-3005, CVE-2007-3503, CVE-2007-3504, CVE-2007-3655, CVE-2007-3698, CVE-2007-3922, CVE-2007-4381, CVE-2007-5232

  Available for: Mac OS X v10.4.10 and later, Mac OS X Server v10.4.10 and later

  Impact: Multiple vulnerabilities exist in J2SE 5.0

  Description: Multiple vulnerabilities exist in J2SE 5.0, the most serious of which may lead to arbitrary code execution and privilege escalation. These are addressed by updating J2SE 5.0 to version 1.5.0_13. These issues are already addressed in systems running Mac OS X v10.5 and later.

Mac OS X Server 10.4, 10.5: Unable to bind to server via "Encrypt using SSL"

This article has been archived and is no longer updated by Apple.

Issue or symptom

When binding to an Mac OS X Server version 10.4.x or 10.5.x via the "Encrypt using SSL" option, Directory Utility may return a message that states:

"Unable to add server. [server name or IP address] does not support directory connections encrypted with SSL.".

Solution

1. On the Open Directory Master create a self-signed certificate. Make sure that the certificate's common name matches the fully qualified domain name (FQDN, such as "www.example.com") of the server.
2. On the client, open Terminal and use the following command to obtain the certificate from the master:

```
openssl s_client -connect myServerName:636
```

3. Copy the lines starting from "-----BEGIN CERTIFICATE-----" up to and including the "-----END CERTIFICATE-----" line.
4. Using these guidelines, create a file on the desktop named "mycert".
5. Paste the information you copied in step 3 into the file.
6. Execute the following command Terminal:

```
sudo mv ~/Desktop/mycert /etc/openldap/
```

7. Edit /etc/openldap/ldap.conf.
8. Under the line "TLS_REQCERT demand" add "TLS_CACERT /etc/openldap/mycert".
9. Restart the client.
10. Open Directory Utility and bind to the LDAP server using SSL.

Mac OS X 10.5: Mail message attachment(s) are not saved

This article has been archived and is no longer updated by Apple.

Issue or symptom

Mail messages that are saved via **Save As...** (in Mail's **File** menu), may not include any message attachment(s) in the saved copy.

Solution

After saving the email message, manually save the attached file(s):

- With the message open, click the "Save" button that appears at the top of the message (between the To: field and message body)

  or

- Drag the attachment's icon or picture from the Mail message body to a different location, such as your desktop

This document will be updated as more information becomes available.

Final Cut Pro: Lack of responsiveness due to network volumes

This article has been archived and is no longer updated by Apple.

Issue

When you switch from another application back to Final Cut Pro, there may be a delay or you may see the spinning disc cursor for a moment.

This can occur if you have a network volume mounted (e.g., via File Sharing) that is connected via a slow network link.

Solution

Unmount any network volumes not required by the work you're doing. Any slow network volumes that are mounted to your computer may cause occasional delays in Final Cut Pro performance, as it polls drives for availability.

See "Final Cut Pro: Choosing a Hard Disk" for additional tips.

Mac OS X 10.5: Developer preview of Java SE 6 for Leopard available from the Apple Developer Connection

This article has been archived and is no longer updated by Apple.

A developer preview of Java SE 6 for Leopard is available via the Apple Developer Connection (ADC) (http://connect.apple.com).

Java is an important technology included as a core feature of Mac OS X, and Apple puts forth extensive effort to make sure Java performs well, is reliable, compatible, and secure. Every Mac running Tiger or Leopard has great support for the most widely-used versions of Java, both Java 1.4.2 and Java SE 5. These versions are regularly updated with security fixes and compatibility improvements to support the widest collection of Java applications in production.

The Java SE 6 release for Leopard is targeted at Java developers. This version of Java for Mac OS X requires an Intel-based Mac capable of running 64-bit applications, including computers with Core 2 Duo processors and any Mac Pro computer. Java SE 6 takes advantage of Leopard's 64-bit capabilities to offer unique performance capabilities for current and future generations of Macs. Please see the release notes included with the Java SE 6 download for additional information about this preview release.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X Server 10.4: Quota information in Server Admin not available after updating to 10.4.11

This article has been archived and is no longer updated by Apple.

Issue or symptom

After updating to Mac OS X Server version 10.4.11, Server Admin may report "Data not available" when viewing disk quota usage.

Solution

You can use Server Admin Tools 10.5 on a Mac OS X 10.5 Leopard-based client to view disk quotas on the Mac OS X Server 10.4.11 server. See this article for admin tools compatibility information.

Additional information

Ethernet: Crossover Cable Pinout

This article lists the pinout and signal assignments for a 10Base-T Ethernet crossover cable.
This article has been archived and is no longer updated by Apple.
Cabling should be Category 5 Unshielded Twisted Pair (UTP) wire for optimum performance.

Here are the pinout assignments:

From	To
1	3
2	6
3	1
4	none
5	none
6	2
7	none
8	none

Here are the signal assignments:

Pin	Signal
1	TD+
2	TD-
3	RD+
4	not used by 10BaseT (1)
5	not used by 10BaseT (2)
6	RD-
7	not used by 10BaseT
8	not used by 10BaseT

Notes:

1. On a telephone line this is TIP.
2. On a telephone line this is RING.

Mac OS X Server version 10.5: Migrating a wiki to another server

This article has been archived and is no longer updated by Apple.

Learn how to move a Mac OS X Server version 10.5 wiki to another server.

Note: Both servers need to be connected to the same Directory Service and the group must be located in Open Directory.

1. Prior to moving any data, use Server Preferences to disable wiki for the group you will be moving.
2. Stop Web Service to make sure no changes occur during this procedure.
3. Migrate the folder located at (/Library/Collaboration/Groups/*group_short_name*/) to the new server, preserving permissions.

   Note: This path is the default location. If you do not see this folder in this location, check Server Admin's Web Services pane to see if the location was changed.

4. Re-enable wiki for the group and choose the new server to host that group's wiki.
5. Start Web Service.
6. Verify that you can access the group's data on the new server.

If the two servers are not part of the same directory structure

In this situation, you'll need to recreate the group on the new server's directory structure, then copy the files to the new server.

1. Determine the GUID of the group using Work Group Manager (use the Inspector to find the value for GUID.)
2. Open the file located at: (path to Collaboration folder/Groups/*group_name*/metadata.plist)
3. Find the GUID key.
4. Replace the value there with the value you found in the new group,
5. Save.
6. Enable wiki on the new group and choose the new server as the host for the new group's wiki.
7. Start Web Service.
8. Verify that you can access the group's data.

Mac Pro (Early 2008): Dongle may not be recognized

This article has been archived and is no longer updated by Apple.

Some applications use an external hardware device that connects to the USB port to authorize the use of the software on your Macintosh. This device is commonly referred to as a "dongle."

If your application is having trouble locating a dongle that is plugged into a display or keyboard, try plugging it into one of the USB ports on the CPU. This should allow your application to more easily locate the dongle and authorize use of your software.

Note: If issues persist on the Mac Pro's USB ports, refer to the third-party vendor that provided the dongle.

Mac Pro (Early 2008): NetBoot client won‘t restart with Mac Pro RAID Card

This article has been archived and is no longer updated by Apple.

Issue or symptom

NetBoot client on a Mac Pro (Early 2008) that contains a Mac Pro RAID Card may unexpectedly shut down before reaching the Finder.

Solution

Remove the Mac Pro RAID Card from the Mac Pro (Early 2008). A Mac Pro (Early 2008) computer containing a Mac Pro RAID Card is not a supported NetBoot configuration.

PowerBook G3 Series: No Sound After Sleep

Sometimes after I bring my PowerBook G3 Series out of sleep, I notice that the sound no longer works. Why is this?
This article has been archived and is no longer updated by Apple.
There is an issue where after sending or receiving a fax with FaxSTF, the sound will stop working after the PowerBook has been brought out of sleep if FaxSTF is set to answer calls.

Workarounds:

- Set FaxSTF to "Answer on never" in the Fax Browser settings.
- After the issue occurs, put the PowerBook to sleep and then bring it out of sleep once again. The audio will start working again and will continue to work until the PowerBook has restarted and the problematic scenario occurs again.

It is normal behavior for the sound input to change to Internal Modem when coming out of sleep if FaxSTF is set to answer calls.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

Mac OS X 10.5: Web Sharing - Relocated Home directory leads to "Forbidden 403" website message

This article has been archived and is no longer updated by Apple.

Issue or symptom

If your home directory location has been changed from the default location, your Personal Web Sharing content may not be accessible to others.

Note: If this issue occurs under different circumstances (the user's Home has *not* been relocated), follow the steps in Mac OS X 10.5: Web Sharing - "Forbidden 403" message appears instead of website content.

Solution

To resolve this issue, edit the user account's Web Sharing configuration file to point at the correct location of your Home. In the following instructions, replace "*myname*" with your username (this is the same name as your user's Home folder in the Users folder.)

1. In the Finder, from the **Go** menu choose **Go to Folder**.
2. Type: `/etc/apache2/users/`
3. Click Go.
4. Drag "*myname*.conf" to the desktop. If you do not see *myname*.conf, follow steps 1 through 6 in this article to create that file on the desktop.
5. Double-click the desktop copy of "*myname*.conf".
6. Replace the string "/Users/*myname*/Sites/" with the correct path to your home directory.
7. Save the file.
8. Follow the steps from 8 through to 20 in this article.

You should now be able to access your website content as expected.

Mac OS X 10.5: Network locations migrated from Mac OS X 10.4 do not retain WINS configuration settings

This article has been archived and is no longer updated by Apple.

Issue or symptom

WINS configuration settings (in the WINS tab of Network preferences, in System Preferences) may not be retained for Network Locations migrated from Mac OS X 10.4.

Solution

Create a new network location (via "Edit Locations..." in the "Location" pop-up menu, in Network preferences).

Configure the new location with the desired WINS settings.

Macintosh: Random Behaviors When No Printer Is Chosen

If a printer selection has never been made, application programs may exhibit a variety of symptoms. This article explains the issue, and tells how to select a printer even if one is not connected.

This article has been archived and is no longer updated by Apple.

Symptom

If a printer selection has never been made, application programs may exhibit a variety of symptoms including:

- The computer stops responding.
- The computer stops responding, and a System error type 1 (or 11) message appears.
- When trying to send a fax by using the Command-Option keyboard shortcut, an error message appears and states that no printer is selected in the Chooser; you are unable to fax.

Solution

The computer may have never been set up to use a printer. Many application programs assume that a printer has been chosen; when that isn't the case, the application(s) may exhibit the symptoms listed above.

If a printer is connected

If your computer is connected to a printer, use the Chooser to select the printer. Close the Chooser and restart your computer before trying to print again.

If a printer is not connected

Macintosh with USB port

If you do not have any USB-compatible printer drivers installed (none of Apple's serial printer drivers, such as ImageWriter or StyleWriter, are USB-compatible), and are not connected to a network printer, there are no printers left in the Chooser to select. In that event, select the "FaxPrint" driver (found in the Chooser) instead. Note that a desktop printer icon is not created for the "FaxPrint" driver. Print commands invoke the Send Fax dialog box instead of the standard Print dialog box.

All other Macintosh computers

Use the Desktop Printer Utility to set up a desktop printer that is not associated with any actual printer (see Figure 1). Then use the Chooser to select the newly-created desktop printer.

Figure 1 Creating a desktop printer that is not associated with any printer.

Alternatively, if the modem port or serial port is unused, set up a "phantom" serial printer selection through the unused port. For example, set up a StyleWriter printer connection through the printer port if your printer port is not being used. If both the modem port and the serial port are being used, you can use the Chooser to set up a fax driver connection.

Technical Background

Setting up a Macintosh without a printer selection is undesirable. There are a few ways that this can happen:

- You skip the Mac OS Setup Assistant at startup.
- When going through the Mac OS Setup Assistant, in the section on selecting a printer, if "Network" is chosen and there is no printer on the network, the Assistant allows you to continue, but no printer is chosen.
- If desktop printing has been turned off, resetting the PRAM causes the Macintosh to forget its printer selection.

Aperture 2: Externally edited images are automatically located alongside originals

This article has been archived and is no longer updated by Apple.

The way externally edited images are handled in Aperture 2 is somewhat different than in past versions. In prior versions, the TIFF or PSD file created by Aperture for external editing was always stored as a managed image in the Aperture library, whether the source image was managed or referenced. In Aperture 2, externally edited images are automatically stored at the same location as the original. After you have edited the image externally, you can choose **File > Relocate Master** to move the image to any location you like.

Published Date: Feb 20, 2012

Aperture 2: Date on exported master image may be different in rare circumstances

This article has been archived and is no longer updated by Apple.

Issue or symptom

In certain rare cases, the date for exported masters may be different than the original.

Solution

This can happen if the original master had no EXIF date. In those cases, IPTC data will be used. If there is no IPTC date, then the modification date for the master image file will be used. This is expected behavior.

Published Date: Feb 20, 2012

Aperture 2: Avoid making manual changes to your library structure

This article has been archived and is no longer updated by Apple.

It has never been considered good practice to manually alter the contents of the Aperture library in the Finder. In Aperture 2.x and later it is especially important to avoid manual changes within the Aperture Library. Make all changes to your library from within Aperture, whenever possible. If you experience issues with your Aperture library, restore it from a recent backup, if one is available, or rebuild the library by holding down the Command-Option keys when starting Aperture.

Xserve (Early 2008): Use only Apple-approved 800MHz DDR2 fully buffered ECC memory

This article has been archived and is no longer updated by Apple.

Issue or symptom

Use of RAM not approved by Apple in Xserve (Early 2008) computers may lead to operational issues, including:

- Excessive ECC memory issues logged in the system log and Server Monitor
- Kernel panics
- Memory not recognized at start-up

Solution

Use only Apple-approved, 800 MHz DDR2 fully buffered ECC memory in Xserve (Early 2008) system configurations.

Xserve (Late 2006) and later: Lights Out Management is incompatible with Link Aggregation on Xserve with Intel processors only

This article has been archived and is no longer updated by Apple.

Issue or symptom

When link aggregation is enabled on an Xserve (Late 2006) computer with an Intel processor and you are using both built-in Ethernet interfaces, Lights Out Management (LOM) services may become inaccessible.

Solution

Xserve computers with Intel processors can be configured to use either Link Aggregation or be accessible via Lights Out Management. However, both cannot be used at the same time.

Additional information

For more information on Link Aggregation, see Mac OS X 10.4 Help: Combining Ethernet ports and Mac OS X 10.5 Help: Combining Ethernet ports.

For more information on Lights Out Management, see What is Lights Out Management?

Mac OS X 10.5: "Missing usb class driver" appears when printing to Lexmark printer

This article has been archived and is no longer updated by Apple.

Issue or symptom

The alert message "Missing usb class driver" may appear when trying to print to a Lexmark printer using a driver included with Mac OS X 10.5 Leopard.

Solution

1. Use the troubleshooting steps in this Lexmark support article to completely remove older drivers.

   Note: You must remove /Library/Printers/Lexmark and /System/Library/Extensions/LexmarkUSBMerge.kext.

2. Restart.
3. Reinstall the driver included with Leopard via Optional Installs on the Leopard Install DVD.

Mac Pro: Supported Microphones

This article has been archived and is no longer updated by Apple.

This article describes microphones supported for use with Mac Pro computers.

The microphone input jack supports line-level input signals. A microphone is not provided in the accessory kit for these computers. The previously-available Apple PlainTalk microphone is not compatible with these computers - although the PlainTalk microphone supplies a line-level signal, it does not use a standard 3.5 mm stereo miniplug, and can't be used with these systems. There are various third-party line-level microphones available that are compatible with the audio line-in port on these units, as well as third-party USB microphones that may be used via a USB connection instead. Examples of devices that provide line-level input include CD players, cassette decks, self-powered microphones, and DVD players. Griffin Technology's iMic adapter allows the use of most mic-level sound input devices.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Xserve (Early 2008): Power consumption and thermal output (BTU) information

This article has been archived and is no longer updated by Apple.

Learn power consumption and thermal output information for Xserve (Early 2008) running Mac OS X 10.5.

Notes

- **Power Consumption** data in watts (W) is measured from the wall power source and includes all power supply and system losses. Additional correction is not needed.
- **CPU Max** is defined as running a compute-intensive test application that maximizes processor usage and therefore power consumption.
- **Disk Max** is defined as running a test application that generates continuous input/output to a RAID set consisting of all internal disks in the system.
- These numbers reflect a 23 Celsius (73.4 Farenheit) ambient temperature running environment. Increased ambient temperatures require faster fan speeds which increase power consumption. At 35 C (95 F), 60 W should be added to reflect increased power consumption.
- These numbers reflect no PCI cards installed.

Xserve (Early 2008)

Configuration : One 2.8 GHz quad-core Intel Xeon Processor, single 80 GB 7200 RPM SATA Apple Drive Module, 2 GB RAM (2x1 GB 800 MHz DDR2 ECC fully buffered DIMMs), ATI Radeon X1300 graphics with 64 MB RAM, no PCI cards

V.90 Protocol: Connectivity Discussion

This article explains why (and when) your computer should use a modem script that limits modem speed to 33.6 kbps, when the modem itself is capable of a 56 kbps connection.
This article has been archived and is no longer updated by Apple.
The iMac modem is the first modem Apple shipped that supports the V.90 protocol. Although derived from the competing x2 and K56flex protocols, the V.90 specification has undergone changes.

When a modem is attempting to establish a connection with another modem it will attempt to connect at the highest speed possible. The speed of the connection is determined by two factors:

1. The capabilities of the other modem:
The remote modem must support the same protocols. The iMac modem supports both V.90 and K56flex protocols so it can connect to other modems that use these protocols at speeds between 33.6 kbps and 53 kbps (although the modem technology is capable of 56 kbps, FCC regulations limit the top speed to 53 kbps). If the remote modem does not support either of these protocols, the iMac modem will then try using the V.34 protocol which has a top speed of 33.6 kbps. The modems will continue to try slower protocols until they find one that both modems are capable of supporting.

2. Quality of the connection:
Modem connections are being made over regular voice telephone lines. The quality of a connection between two points can be different each time the connections is made. Once the modems have negotiated a protocol to use, they test the ability of the connection to sustain the speed of the connection. The higher the speed of the connection, the more susceptible it is to noise on the phone lines. Therefore, even when making a V.90 connection between the same two points, one connection could be 44000 bps while the other could be 38000 bps.

If the quality of the connection is such that it can not support the slowest V.90 connection then the modems steps down to the next protocol.

What we are observing with the iMac modem is this V.90 implementation is overly aggressive. Instead of negotiating down to support a slower but more stable connection, the modem keeps trying to connect at a higher speed. This causes the remote modem to determine that a connection can't be established and it hangs up.

There are times when this aggressive behavior manages to complete a connection, only to be dropped minutes later since the quality of the phone connection really can not support that connection speed.

The V.34 only modem script is a workaround for customers that are unable to connect using the V.90 protocol. In many cases, even if the V.90 implementation negotiated downward properly, the resulting connection might end up being between 28.8 kbps and 33.6 kbps due to phone line quality. In these cases there is no performance difference between using the V.34 and V.90 protocols.

Apple is working with others in the modem industry to improve the behavior of the V.90 implementation. The iMac modem is capable of being upgraded with software.

Currently, modem firmware updates are available from the Apple Software Updates updates page.

For additional information on 56 kbps connectivity, see:

Aperture 2: Newly supported images may not display properly after upgrade from Aperture 1.5.x to 2.0

This article has been archived and is no longer updated by Apple.

Issue or symptom

In cases where you have imported images from an unsupported camera into your Aperture 1.5.x library and then upgraded to Aperture 2.0, the images may display improperly, even though the camera is now supported. Issues may include:

- The aspect ratio may be incorrect.
- The Console may display warnings that "0x0" is not a valid image size.
- The images cannot be added to books, web pages, light tables, etc.
- Aperture may quit unexpectedly if an affected image is published to a Web Gallery.

Solution

To resolve this issue, select the affected images and choose **File > Migrate Images**. Note that this will only work for images supported in Aperture 2.0. Images from cameras not supported by Aperture 2.0 will not display correctly.

Published Date: Feb 20, 2012

Aperture 2: Some referenced images may be reimported even when Do Not Import Duplicates is selected

This article has been archived and is no longer updated by Apple.

Issue or symptom

When you choose to import new images from a folder that contains some images already referenced by your Aperture library, duplicates of the pre-existing images are sometimes imported, even when you choose the **Do Not Import Duplicates** option.

Solution

This can happen if you have edited the referenced images with another application. Aperture recognizes that the images have changed, and reimports them as new images.

Xserve RAID: Best practices for data integrity

This article has been archived and is no longer updated by Apple.

These are suggested guidelines for deploying Xserve RAIDs help to ensure consistent access to data stored on RAID volumes.

Using caches

Enable the Xserve RAID controller cache and Drive caches to improve performance when reading and writing data to your Xserve RAIDs. Note that enabling these options requires that you to use backup batteries and uninterruptible power supply units.

Additionally, to ensure consistent communication between Fibre Channel devices, disable the RAID Admin feature named "Enable Host Cache Flushing." Disabling this feature also requires that you to use uninterruptible power supply units. For more information about this and about configuring the Xserve RAID for maximum performance, see this article.

Deploy a backup solution

There are many means of backing up data, including hardware solutions and software solutions. The backup process may be as simple as a drag and drop of vital files to a local or network volume or may be as complex as using a software solution that backs up data to a hardware solution, such as a tape library or Disk Array, on a schedule. For more information on backup solutions, please contact your Apple Sales Representative.

Maintain filesystem integrity

Schedule runs of Disk Utiliy or an alternate filesystem utility.

Use latest firmware

Ensure that Xserve RAIDs are running the most recent version of Xserve RAID firmware. To verify Xserve RAID firmware versions, choose **Raid Admin > Components** and click on the image of the controller. To upgrade a controller's firmware, download the most recent version of RAID Admin which includes the most recent version of firmware.

Unmount filesystems from initiators before rebooting targets

Before performing any operation that may cause an Xserve RAID to be restarted, unmount any filesystems that correspond to the target which is to be restarted. Certain administrative changes will result in Storage Devices restarting. The Xserve RAID will restart if any of the following settings are configured:

RAID Admin > Create Array
RAID Admin > Delete Array
RAID Admin > Settings > System
RAID Admin > Settings > Network
RAID Admin > Settings > Fibre Channel
RAID Admin > Advanced > Slicing
RAID Admin > Advanced > LUN Masking

Also, avoid performing changes in **RAID Admin > Advanced > Expansion** that will delete a pre-existing array if the array is acting as a LUN that has been incorporated into the Xsan Volume.

Internet Setup Assistant: Where Are Settings Stored?

This article describes where the Internet Setup Assistant stores its settings and how to access these settings without re-using the Internet Setup Assistant.
This article has been archived and is no longer updated by Apple.
The Internet Setup Assistant is designed to simplify the setup and configuration of a Macintosh for Internet access. There are times, however, when it would be convenient to modify these settings without going through the Internet Setup Assistant. This article will describe where the information gathered by the Internet Setup Assistant is stored.

All the information necessary for an Internet connection is managed by several control panels. All of these control panels are conveniently accessible from the Remote Access menu when the Remote Access control panel is open.

Note: This article assumes a dial up connection to an Internet service provider (ISP).

1. Open the Remote Access control panel.

2. Select Configurations from the File menu (or type Command-K). This displays the list of existing configurations.

To modify an existing configuration, select it from the list and click the Make Active button.

To create a new configuration, select an existing configuration and click the Duplicate button. Click the Rename button to give the new configuration a unique name. Click the Make Active button.

The Remote Access control panel contains the following:
- User name (for your ISP account)
- Password (for your ISP account)
- Access phone number (access number for your ISP)

If you make any changes you are prompted to save them when closing the Remote Access control panel.

3. Click on the Remote Access menu while the Remote Access control panel is open. This menu lists several other control panels. The other control panels of interest for configuring an ISP connection are Modem and TCP/IP.

4. Open the Modem control panel.

Note: The Configurations option described above in the Remote Access control panel is also available in the Modem control panel.

5. Select the port that the modem is connected to in the Connect via: pop up menu.

6. Select the modem script in the Modem: pop up menu.

Other settings include enable/disable modem sound, tone/pulse dialing, and whether the dial tone should be ignored.

7. Open the TCP/IP control panel and make the selections listed below.

Note: The Configurations option described above in the Remote Access control panel is also available in the TCP/IP control panel.

- Connect via: For most ISPs this should be set to PPP.
- Configure: For most ISPs this should be set to Using PPP Server.
- Name server addr: Enter the domain name server (DNS) addresses here.
- Search domain: Enter the domain name here.

The Apple Location Manager 2.0 provides a convenient way of grouping the settings in the Remote Access and TCP/IP control panels. For further information open the Location Manager and click the question mark for online help.

Promise VTrak RAID: Drives are reported "Dead" or Offline

This article has been archived and is no longer updated by Apple.

Issue or symptom

In certain cases, Promise VTrak RAID drives that belong to an array may go offline. One such case occurs when a RAID head is booted before its corresponding expansion chassis. In such situations, the drives that compose an array may be Offline, which results in the physical drives status being reported as "Dead" and the Logical Drive status reported as Offline in the web administration interface. The arrays drives light may be red.

Solution

To resolve this issue, an administrator should manually bring the drives online. To do so, follow these steps:

Shutdown and Boot the RAID Head and expansion chassis in the correct order.

Establish a Telnet connection to the RAID head over port 2300. To do so, open Terminal (in /Applications/Utilities) and issue the following command:

```
telnet IP_Address 2300
```

Replace *IP_Address* with the IP Address assigned to the RAID heads Ethernet port. If you are not certain what IP Address is assigned to the Promise RAID, refer to the Product Manual.

3. Authenticate when prompted. If you are not certain what administrator name and password is assigned to the Promise RAID, refer to the Product Manual.
4. Issue the following command:

```
phydrv
```

This command will produce a list of drives and their status. Drives with red lights may be reported with status "Dead".

In this example, Drives 17 and 18 are reported as "Dead":

```
============================================================
PdId Model Type CfgCapacity Location OpStatus ConfigStatus
============================================================
16 ST3750640NS SATA 698.49GB Encl1 Slot16 OK Array0 SeqNo4
17 ST3750640NS SATA 698.49GB Encl2 Slot1 Dead Array0 SeqNo5
18 ST3750640NS SATA 698.49GB Encl2 Slot2 Dead Array0 SeqNo6
```

5. For each of the drives with the OpStatus, Dead, issue the following command:

```
phydrv -a online -p PdId
```

Replace *PdId* with the PdId number which corresponds to the number farthest to the left in the previous steps output. For example, to bring Drive 17 online, the following command would be issued: `phydrv -a online -p 17`

Once this command has been executed for each drive that is reported Dead, issue the following command again to review the status of the drives:

```
phydrv
```

Notice that the drives that were reported offline are now reported as Forced Online. For example:

```
============================================================
PdId Model Type CfgCapacity Location OpStatus ConfigStatus
============================================================
16 ST3750640NS SATA 698.49GB Encl1 Slot16 OK Array0 SeqNo4
17 ST3750640NS SATA 698.49GB Encl2 Slot1 Forced Onl Array0 SeqNo5
18 ST3750640NS SATA 698.49GB Encl2 Slot2 Forced Onl Array0 SeqNo6
```

If a drives OpStatus remains Dead, contact Promise Support.

No audio during iTunes Store video playback with iTunes 7.6 for Windows XP

This article has been archived and is no longer updated by Apple.

Issue or symptom

You may hear no audio when playing videos purchased from the iTunes Store.

Solution

This only affects content purchased from the iTunes Store. You may be able to play this content in QuickTime Player. The content will sync and play normally with audio to iPod and iPhone.

Update to QuickTime 7.4.1 to restore full playback of the affected content in iTunes.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iPhone: SMS messages may be displayed in the wrong order when sending or receiving text messages

This article has been archived and is no longer updated by Apple.

Issue or symptom

When sending or receiving text messages on the iPhone, the SMS messages may be displayed out of sequence.

Solution

Use iTunes to update to iPhone Software 1.1.4 or later.

If the issue continues:

- Make sure iPhone is setup to receive the network time. Choose **General** > **Date & Time** and turn **Set Automatically** to ON. (Note that in some locations, network time may not be available and in some cases, you may not see this option).
- If the issue continues after turning this setting on, the issue may be occurring because messages are being sent in quick succession (more common if the messages consist of only a few short words).

Mac OS X 10.5, Ink: Handwriting recognition cannot be enabled

This article has been archived and is no longer updated by Apple.

Issue or symptom

You might not be able to enable Handwriting recognition in Ink preferences (in System Preferences). This may occur on some Macs that shipped with Leopard pre-installed.

Solution

Use this workaround to enable handwriting recognition:

1. From the Finder's **Go** menu, choose **Utilities**.
2. Open Terminal.
3. Carefully type (or paste) the following command, then press Return.

   ```
   sudo rm /System/Library/Caches/com.apple.IntlDataCache*
   ```

4. Enter your admin password if prompted for it.
5. Type or paste the following command in Terminal, then press Return.

   ```
   sudo rm /var/folders/*/*/-Caches-/com.apple.IntlDataCache*
   ```

6. Type or paste the following command in Terminal, then press Return.

   ```
   rm ~/Library/Preferences/com.apple.ink*
   ```

7. Restart the computer.

Aperture 2: RAW 2.0 not available with some cameras

This article has been archived and is no longer updated by Apple.

Issue or symptom

RAW 2.0 decoding of RAW images in Aperture 2 is not available with certain cameras. In these cases, the Recovery and Black Point setting sliders are dimmed.

Solution

A few cameras do not support RAW 2.0 decoding. In these cases, the only available options will be RAW 1.1 and RAW 1.0. Settings only offered with RAW 2.0, such as Recovery and Black Point in the Exposure adjustment are not available in these cases.

Mac OS X Server version 10.5: Setting up KDC to support Kerberized NFS for non-Mac OS X clients

This article has been archived and is no longer updated by Apple.

In Mac OS X Server version 10.5, Apple's Kerberized NFS implementation strictly follows RFC 1964 and as a result only supports single DES encryption. However, Open Directory or other Kerberos environments will often set up multiple keys with differing encryption types. Mac OS X 10.5 clients will only request key types that they support, so the additional key offerings will not cause an issue for Mac OS X clients. However, a non-Mac client of a Mac OS X NFS server could request a session key that the server can not handle. If you are an administrator of such an environment, it will be necessary for you to remove the offending keys from the directory or KDC. This can be done with the `kadmin` command.

Use the following commands to generate only single DES keys for the server and update the keytab by removing the current keys for the nfs server from the KDC and the keytab then creating a new single DES key and adding it to the keytab.

Example

In the following example, `TEST.EXAMPLE.COM` is the name of the Kerberos realm, "`macos-x-nfs.example.com`" is the name of the server, and "`adminuser`" is the name of a user with administrative access to the KDC. Substitute the correct realm, host and user names for your server in each command.

1. Authenticate to the KDC. Enter the password for "`adminuser`" at the prompt.

```
$ sudo kadmin -r TEST.EXAMPLE.COM -p adminuser/admin@TEST.EXAMPLE.COM
Password:

Authenticating as principal adminuser/admin@TEST.EXAMPLE.COM with password.
Password for adminuser/admin@TEST.EXAMPLE.COM: (adminuser/admin's Kerberos password)
```

2. Verify that the NFS service principal has undesirable keys via get_principal:

```
kadmin: get_principal nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM

Principal: nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM
Expiration date: [never]
Last password change: Tue Oct 09 14:56:57 PDT 2007
Password expiration date: [none]
Maximum ticket life: 0 days 10:00:00
Maximum renewable life: 7 days 00:00:00
Last modified: Tue Oct 09 14:56:57 PDT 2007 (adminuser/admin@TEST.EXAMPLE.COM)
Last successful authentication: [never]
Last failed authentication: [never]
Failed password attempts: 0 Number of keys: 3
Key: vno 3, Triple DES cbc mode with HMAC/sha1, no salt
Key: vno 3, ArcFour with HMAC/md5, no salt
Key: vno 3, DES cbc mode with CRC-32, no salt
Attributes:
Policy: [none]
```

3. Note that Triple DES and ArcFour are listed in addition to a single DES key. To correct this, remove the the principal with the `delete_principal` command:

```
kadmin: delete_principal nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM

Are you sure you want to delete the principal "nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM"? (yes/no): yes

Principal "nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM" deleted.
Make sure that you have removed this principal from all ACLs before reusing.
```

4. Add the principal back (using `randkey` since this is a service principal) with the `-e` option to specify only the single DES key des-cbc-crc:normal.

```
kadmin: add_principal -randkey -e des-cbc-crc:normal nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM
```

```
WARNING: no policy specified for nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM; defaulting to no policy
Principal "nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM" created.
```

5. Verify that only the single DES key has been added by issuing the `get_principal` command again.

```
kadmin: get_principal nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM

Principal: nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM
Expiration date: [never]
Last password change: Tue Oct 09 15:00:38 PDT 2007
Password expiration date: [none]
Maximum ticket life: 0 days 10:00:00
Maximum renewable life: 7 days 00:00:00
Last modified: Tue Oct 09 15:00:38 PDT 2007 (adminuser/admin@TEST.EXAMPLE.COM)
Last successful authentication: [never]
Last failed authentication: [never]
Failed password attempts: 0
Number of keys: 1
Key: vno 2, DES cbc mode with CRC-32, no salt
Attributes:
Policy: [none]
```

6. Remove the old set of keys from the keytab.

```
kadmin: ktremove nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM

Entry for principal nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM with kvno 3 removed from keytab
WRFILE:/etc/krb5.keytab.
Entry for principal nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM with kvno 3 removed from keytab
WRFILE:/etc/krb5.keytab.
Entry for principal nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM with kvno 3 removed from keytab
WRFILE:/etc/krb5.keytab.
```

7. Add the new key to the keytab.

```
kadmin: ktadd -e des-cbc-crc:normal nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM

Entry for principal nfs/macos-x-nfs.example.com@TEST.EXAMPLE.COM with kvno 3, encryption type DES cbc mode
with CRC-32 added to keytab WRFILE:/etc/krb5.keytab.
```

8. Quit:

```
kadmin: quit
```

Additional information

For more information about Kerberized NFS in Mac OS X Server version 10.5, see this article.

Using the O2 Cloud Wi-Fi hotspot in the UK after iPhone has been replaced

This article has been archived and is no longer updated by Apple.

Issue or symptom

You may not be able to use the O2 Cloud Wi-Fi hotspot in the UK after iPhone has been replaced.

Solution

If your O2 tariff contract includes free O2 cloud Wi-Fi coverage and your iPhone has been replaced, please contact O2 with the new Wi-Fi Address to ensure you have access to the Cloud network with your new iPhone.

To find the Wi-Fi Address tap **Settings > General > About** and scroll down to Wi-Fi Address.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

56 kbps Modem: Checking and Changing Country Codes

This document describes how to check and change modem country codes in the internal 56 kbps modem.
This article has been archived and is no longer updated by Apple.
The internal modem uses country specific parameters based on the setting of the country code. This code can be set with AT commands or by using the Modem Country Selector. (This application ships with computers outside the United States.)

Checking the Country Code

The easiest method for checking and changing country codes is to use the Mac OS 9 only application; Modem Country Selector. If you are using Mac OS X, and want to useModem Country Selector you must restart in Mac OS 9, as it does not function as a classic application in Mac OS X. Steps for using the Modem Country Selector application are listed in the Using the Modem Country Selector section.

As an alternative to Modem Country Selector, you can use AT Commands with the modem. The steps for using AT commands are listed in the Using AT Command sections.

Using the Modem Country Selector

1. Double-click the Modem Country Selector application icon.
The Modem Country Selector application opens.
Note: The country the modem is set for automatically appears in the pop-up country menu.

2. Choose the country in which the modem will be used from the pop-up menu.

3. Click OK.

4. When a message appears saying the modem is configured, click OK to quit the application.

The modem is now properly set up for use in the chosen location.

Using AT Commands in Mac OS 9

1. Open the Modem control panel.
Choose Null Modem 9600 from the Modem menu.

2. Close the Modem control panel.
A save dialog appears.

3. Save the changes to the Modem control panel.

4. Open Remote Access control panel.

5. Click Options.

6. Click the Protocol tab.

7. Select Connect to a command-line host:
If Use terminal window is not selected, also select that option.

8. Click OK

9. Enter any number or letter into the number and password area of the Remote Access control panel.
This enables the Connect button.

10. Click Connect.
A modem terminal window appears.

11. type `ATI5` into the terminal, then press return.
The country code is returned.

Important This document covers different modems. An additional code is needed to determine how to interpret the country code.

12. Type `ATI12` into the terminal, then press return.
A register code is returned.

If `S1, D1` or `J1` is returned after entering `ATI12`, then use the `S1, D1` or `J1` column in the country code table. Otherwise use the first code column to determine what country code the modem is currently set to.

Once finished, you should choose your original Modem menu setting again.

Using AT Commands in Mac OS X

The process for checking the country code under Mac OS X is similar to Mac OS 9.

1. Network system preference.
2. Click the Modem tab.
3. Choose Null Modem 9600 from the Modem menu.
4. Click the PPP tab in the Network system preference.
5. Click PPP options.
6. Select Connect using a terminal window (command line)
7. Click OK
8. Enter any number or letter into the number and password area of the Remote Access control panel.
9. Either open Internet Connect and click connect, or if the Modem status is available in the menu bar, choose connect.
A modem terminal window opens.
10. type `ATI5` into the terminal, then press return.
The country code is returned.

Important This document covers different modems. An additional code is needed to determine how to interpret the country code.

11. Type `ATI12` into the terminal, then press return.
A register code is returned.

If `S1, D1` or `J1` is returned after entering `ATI12`, then use the `S1, D1` or `J1` column in the country code table. Otherwise use the first code column to determine what country code the modem is currently set to.

Once finished, you should choose your original Modem menu setting again.

Changing Country Codes

The easiest way to change country codes in the modem is to use the Modem Country Selector in Mac OS 9. However you can also use an AT command to change the country code.

1. Use the procedures listed in the Checking Country Codes to open a modem terminal window.
2. Find the proper country code in the Country Code table.

3. If `ATI12` results in `D1` or `J1`, then type **`AT+GCI=xx`**, where xx is the country code you want to set the modem to.

Otherwise:

Type **`AT*NCx`**, where x is the country code you want to set the modem to.

Examples for D1 and J1 result codes:

To set the modem for proper use in Germany, use **`AT+GCI=42`**

To set the modem for proper use in Sweden, use **`AT+GCI=A5`**

Examples for non-D1 result codes:

To set the modem for proper use in Germany, use **`AT*NC6`** OR **`AT*NC14`** depending on which modem is installed in your computer.

To set the modem for proper use in Sweden, use **`AT*NC14`** (the same setting is used in all non-USB internal Apple modems).

Country Codes
Use the appropriate Code column that corresponds to the result you received when you used the ATi12 command.

Country	Code	S1 Code	D1 Code	J1 Code	Country	Code	S1 Code	D1 Code	J1 Code
Argentina	22	22	-	07	Israel	18	18	-	58

Mac OS X Server: Editing Files in Single User Mode

My server won't start up into the Workspace Manager. How can I edit files in single-user mode?
This article has been archived and is no longer updated by Apple.
To learn how to boot into single-user mode see the following article:

Article 30837: "**Mac OS Server: Booting into Single-User Mode**"

We ship a number of common editors with Mac OS X Server, including ed, emacs, ex, edit, and vi. Unfortunately, some of these editors do not work well in single-user mode. Some require better terminal support than is available in single-user mode; others try to write to /tmp, which isn't possible while booted from a read-only file system such as a CD-ROM; others are just plain unfriendly to the uninitiated.

Fortunately, the standard Mac OS X Server distribution includes pico, a simple, display-oriented text editor that overcomes the above problems. In order to use pico, you will need to change your terminal settings.

Note: The "#" symbol does not need to be typed. It represents the prompt at which commands are typed.

```
# TERM=vt100
# export TERM
# ^L (This means hold down the control key and the L key, then press return. This is so that the screen will draw.)
# pico the.file.you.want.to.edit
```

Here are the only commands you really need to know in order to edit a file using pico, some of which are displayed right at the bottom of the screen:

Ctrl-F: Move Forward a character
Ctrl-B: Move Backward a character
Ctrl-P: Move to the Previous line
Ctrl-N: Move to the Next line
Ctrl-D: Delete the character at the cursor position (or just use Backspace to delete the previous character)
Ctrl-X: Save the file and quit (press "y" and then Return to confirm the save)
Ctrl-G: Display help text listing the above commands and more

Normally, pico will also let you use the arrow keys to move around. However, these keys have not been mapped yet when you're in single-user mode, so you will need to use the Control-key combinations above. Similarly, you may be used to a keymapping that uses a different key (such as the Caps Lock key) as the Control key. This mapping has not happened yet either in single-user mode, so the Control key is in fact the Control key.

TA25193_Apple_TV_Some_menu_items_may_not_appear_with_software_version_.pdf

Apple TV: Some menu items may not appear with software version 2.0

This article has been archived and is no longer updated by Apple.

Issue or symptom

After upgrading to Apple TV software version 2.0, the following menu items may appear to be missing:

- In Movies: Top Movies, Genres, All HD, Search
- In TV Shows: Top TV Shows, Genres, TV Networks, Search
- In Music: Top Music, Music Videos, Genres, Search
- In Podcasts: Top Podcasts, Genres, Podcast Providers, Search

Note: Not all iTunes Stores offer the same content. The list of available items varies by country.

Solution

Your menu items should appear after following these steps:

1. Navigate to **Settings** > **General**.
2. In the General menu, select **iTunes Store**.
3. Pick the store for the country where you are located. A checkmark will appear next to your selection.

WebObjects 5.4.1 release notes

This article has been archived and is no longer updated by Apple.

This document contains an overview and download information for the WebObjects 5.4.1 Update. WebObjects 5.4.1 is primarily for developers who want to develop WebObjects applications with Mac OS X 10.5. WebObjects 5.4.1 is formally qualified and supported on the Mac OSX Leopard/Java 5 platform. Please note that WebObjects 5.4.1 is tested to work with the default Xcode installation location and is not guaranteed to work with other installation locations. The upgrade installer always updates the default location for WebObjects frameworks.

This update addresses the following issues:

- Issues with serializing/deserializing webservices data
- Deadlock issues in EOF
- SQL generation for various database vendors
- Issues with WebObjects Foundation collection classes
- Deployment tool fixes
- Additional fixes

Installing WebObjects 5.4.1 Developer System

The WebObjects 5.4.1 Developer Update is available as an ADC download at http://developer.apple.com/tools/download/ and http://connect.apple.com/. It requires Mac OS X 10.5 Leopard.

System requirements

- Java 5
- WebObjects 5.4
- Mac OS X 10.5 or later

If you are installing a clean WebObjects 5.4 system, install the software in the following order:

1. Run the Xcode 3.0 installer.
2. Select the Custom Install option.
3. Select the WebObjects install packages.
4. Use Software Update and update to the latest Java 5
5. Go to ADC Tools download at http://developer.apple.com/tools/download/ or http://connect.apple.com/.
6. Download the WebObjects 5.4.1 update

If you are updating from WebObjects 5.4 to WebObjects 5.4.1 Developer, install the software in the following order:

1. Run Software Update and upgrade to the latest version of 10.5.
2. Run Software Update and upgrade to the latest Java 5 release.
3. Download the WebObjects 5.4.1 from http://developer.apple.com/tools/download/ or http://connect.apple.com/ and run the update installer.

Installing WebObjects 5.4.1 update for Mac OS X Server version 10.5

This update is available through the Software Update feature of Mac OS X Server. It is part of the Mac OS X Server 10.5 update and is not an individual download.

System requirements

- Mac OS X Server version 10.5 or later
- Java 5

If you are updating a WebObjects 5.4 system or creating a new install on Mac OS X Server version 10.5

1. Install Mac OS X Server version 10.5
2. Run Software Update to update to Mac OS X Server version 10.5.2

About the Safari 3.1 Update

This article has been archived and is no longer updated by Apple.

Installation

To update to Safari 3.1, use Apple Software Update or a standalone installer. You only need to use one of these methods to update your computer.

Software Update

Software Update will automatically check for the latest Apple software using the Internet. (You might have followed a Software Update link to this article to learn more about the update.) If your computer is not up-to-date, other available software updates will appear.

Standalone installer

Download the update installer and run it manually. This is a useful option when you need to update multiple computers but only want to download the update once.

Improvements

Performance

- Improves JavaScript performance

Standards

- Adds support for CSS 3 web fonts
- Adds support for CSS transforms and transitions
- Adds support for HTML 5 <video> and <audio> elements
- Adds support for offline storage for Web applications in SQL databases
- Adds support for SVG images in <img> elements and CSS images
- Adds support for SVG advanced text

Microsoft Windows

- Improves Back/Forward performance
- Supports signed Java applets
- Shows Caps Lock icon in password fields
- Adds support for showModalDialog
- Localized in 16 languages
- Adds support for International Domain Names
- Improves handling of Japanese, Chinese, and Korean text
- Contextual menu now allows opening a link in a window or tab
- Improves pop-up blocking to work with plug-ins

Compatibility

- Increases site compatibility

Stability

- Improves application stability

Developer

- Adds option in Safari preferences to turn on the new Develop menu which contains various web development features
- Allows access to Web Inspector
- Allows access to Network Timeline
- Allows editing CSS in the Web Inspector

- Allows custom user agent string
- Improves snippet editor

Other

- Double clicking on the Tab Bar opens new tab
- Includes URL metadata when images are dragged or saved from browser
- Opens Download and Activity window in current Space
- Supports trackpad gestures for back, forward, and magnify on MacBook Air and compatible MacBook Pro computers
- Shows Caps Lock icon in password fields

Security

- For information about the security content of this update, visit this website.

Mac OS X Server: Hangs at "autonfsmount" Message

Sometimes a server that was working fine may hang during boot at the message "autonfsmount" (Or "Mounting Remote Filesystems" in graphical mode). You can tell exactly where the machine is hanging by entering the "-v" option at the boot: prompt.
This article has been archived and is no longer updated by Apple.
The reasons for this may be:

1. The network information may have been configured incorrectly.
2. The server has been configured properly for a network, but is currently not on the network.
3. You may have booted with the "config=Default" option which effectively takes you off the network because the default configuration does not include a network driver.

Solution:
Your server will eventually boot after a very long series of timeouts, but you can overcome this by resetting its network configuration information to a default state.

The best way to do this is to boot in single user mode and replace the file.

Apple TV: Tip - Author your own movie content with AC-3 audio for true surround sound

This article has been archived and is no longer updated by Apple.

If your Apple TV is connected to a Dolby Digital-capable sound system, your content can have true surround sound.

Apple TV will pass through 5.1 surround sound audio encoded in Dolby Digital AC-3. The AC-3 audio must be properly included in the movie in order for it to pass through correctly.

To create content for use with Apple TV, the movie must have two audio tracks:

- Advanced Audio Coding (AAC) stereo
- AC-3 track for surround

Note: Both tracks should have the same sample rate (48 kHz is normal).

For compatability, the following is required:

- Both tracks must be provided.
- The AAC track should be first and it must be enabled.
- The AC-3 track should appear after the AAC track and it should be disabled by default.
- The AC-3 track must also use the appropriate MPEG-4/ISO standard.

Apple TV uses the AC-3 track as a pass-through mode only. For example, it passes data out to an A/V receiver capable of Dolby Digital playback. The AC-3 audio is sent over the HDMI and the optical audio output of Apple TV.

To select AC-3 data through these ports, go to **Settings > Audio > Dolby Digital Out** and select **On**.

These movies can be created using applications such as FinalCut Express and FinalCut Pro.

Note: The AAC track is used in any situation where just stereo output is required.

iCal: Some calendar events do not appear after installing Mac OS X 10.5.2 Update

This article has been archived and is no longer updated by Apple.

Issue or symptom

After installing the Mac OS X 10.5.2 Update, some iCal events may not appear.

Solution

1. Quit iCal.
2. Quit Mail if it's running.
3. From the Finder's **Go** menu, choose **Home**.
4. Open the Library folder.
5. Open the Calendars folder.
6. Move the "Calendar Cache" file to the Trash.
7. Open iCal.

You may see a message stating that your calendars are being updated. You can delete the "Calendar Cache" file that you moved in step 5.

iPod shuffle (2nd generation) song capacity

This article has been archived and is no longer updated by Apple.

iPod shuffle (2nd generation) is available in 1 GB and 2 GB capacities. The 2 GB model can hold up to 500 4-minute songs in 128-kbps AAC format.

Issue

Customers using the 2 GB model with iPod software 1.0.3 may notice that iTunes displays a 480 song maximum in the Settings tab when the iPod is connected to iTunes as shown below:

Solution

To resolve this issue, update iPod shuffle (2nd generation) to iPod software version 1.0.4 or later. For more information about iPod shuffle specifications, please visit www.apple.com/ipodshuffle/specs.html.

Published Date: Oct 11, 2016

Mac OS X 10.5: Hard drive disappears from the Finder

This article has been archived and is no longer updated by Apple.

Issue or symptom

A connected drive may not appear in the Finder, even though you can navigate to it via the Finder's **Go** menu.

Solution

1. Open Terminal (located in /Applications/Utilities).
2. In Terminal, type or paste this command on a single line:

   ```
   xattr -d com.apple.metadata:kMDItemFinderComment
   ```

   (Leave a space at the end but do *not* press Return yet.)

3. Append the path to the affected drive to the above command. For the startup volume, that path is "/".

   - For example, for the startup volume the entire command would be:

   ```
   xattr -d com.apple.metadata:kMDItemFinderComment /
   ```

   - For a volume *other* than the startup volume, add "/Volumes/" and its name to the path. Remember to add a "\\" character before any spaces. For example, if the affected volume is named "My Mac drive", the entire command would be:

   ```
   xattr -d com.apple.metadata:kMDItemFinderComment /Volumes/My\\ Mac\\ Drive
   ```

4. Press Return once you have verified the command is typed correctly.
5. In the Terminal window, type:

   ```
   sudo chflags nohidden (PATH)
   ```

   Replace *(PATH)* with the path to the volume that is affected by the issue, as you did in step 3.
   For example, to make your startup volume visible again you would use this command:
   ```
   sudo chflags nohidden /
   ```

6. Press Return.
7. Quit Terminal.
8. Log out and back in again (or restart).

Your drive should be visible.

This document will be updated as more information becomes available.

Mac OS X Server: niutil Utility

This article will show you how to use niutil to manipulate a NetInfo database.
This article has been archived and is no longer updated by Apple.

Why use niutil?

Despite its reputation, niutil is fairly simple. Its options allow you to create, examine, and destroy NetInfo directories or properties. Many of the things you can do with niutil you can also do with NetInfoManager. Because it is easy to make mistakes on a command line, it is usually safer to use NetInfoManager when making modifications to NetInfo.

Sometimes, though, niutil is the only choice-for example, if you are logged in over a modem without access to the graphic interface.

niutil options

- option function: list Display the subdirectories of a given NetInfo directory.

- read: Display the properties and values associated with a given NetInfo directory.

- create: Create a NetInfo directory.

- createprop: Create a property.

- destroy: Destroy a NetInfo directory.

- destroyprop: Destroy a property.

- t: Identify the domain with tagged domain notation.

- p: Propt for the root password of the domain.

A look at the database

The two options for examining a NetInfo database are list, for directories, and read, for properties. With each, you must indicate the domain to read and the path of the directory. Because you're only examining the NetInfo database, there's no danger here.

list

You use the list option to examine the subdirectories of a given NetInfo directory. The following command looks at the subdirectories of the /machines directory in the parent domain (..):

niutil -list .. /machines

The output of this command includes the number of each subdirectory and, by default, the value or values of the name property. In this case, each subdirectory represents a host entry stored in the parent domain.

35 earth_dialin
33 earth_remote
2 earth mailhost
34 pluto
37 venus

If you want to examine the values of a different property, simply include the name of the property in the command:

niutil -list .. /machines serves

The output lists the values of the serves property instead of the name property. Notice that directory 35 (earth_dialin) has no value; it does not have a serves property.

35
33 earth_remote/local
2 earth/local ./network
34 mars/local
37 venus/local

read

The read option displays the properties associated with a given NetInfo directory. The following command shows the properties stored in the host entry for earth in the parent domain:

niutil -read .. /machines/earth

The output includes each property key and the associated value(s). Notice that this directory has a host alias (mailhost) stored as the second value of the name property.

name: earth mailhost
ip_address: 192.82.163.1
serves: earth/local ./network ../super

If you can't access a domain with a relative name (".", "..", or "/"), you can use tagged domain notation with the t option. Remember that tagged domain notation is in the form host/tag, where host is the name or Internet address of the computer serving the domain, and tag is the tag of the NetInfo database. The following command lists the properties stored in the directory /users/root (the root user account) in the domain tagged super served from the host earth:

niutil -read -t earth/super /users/root

The output of this command contains all the properties for a user account:

name: root
uid: 0
gid: 1
realname: Operator
home: /
shell: /bin/csh
_writers_passwd: root
passwd: Vbg0X7ZIQSEIU

The most familiar way to specify a NetInfo directory is with the value of the name property, and so far, the examples have all used this method. However, you can also identify a directory by the value of some other property. For example, the following command displays the properties associated with the subdirectory under /users that has a uid property with a value of 0 in the root domain:

niutil -read / /users/uid=0

Because the root account has user ID 0, the output of this command is the same as if you had indicated /users/root.

What if the value you specify is ambiguous-if more than one directory has a property with the indicated value? The following command looks in the current domain for a user account that has the default group ID 1. Group ID 1 is the group wheel, and the users root, daemon, and me have it as their default group. Any guesses as to the result?

niutil -read . /users/gid=1

The read option displays only the properties for a single directory. The first directory that matches the specified path is displayed, as determined by the directory number. In this case, root has the lowest directory number, and its directory is the first one found. Remember, the list option displays directory numbers as well as, by default, the value of the name property.

Finally, if you know the directory number, you do not need to use a path. For example, the output of niutil with the list option used earlier shows us that /machines/earth in the parent domain is directory number 2. The following commands are equivalent:

niutil -read .. /machines/earth
niutil -read .. 2

create

The following command creates a new directory named admins under the /aliases directory in the parent domain:

niutil -create .. /aliases/admins
niutil -read .. /aliases/admins
name: admins

As you can see from this output, you now have a new directory with a single property, name, assigned the value admins. A mail alias without any members, however, is not very useful.

Note: When using create, be careful what you type so you create only directories you intend to create.

createprop

The next command creates a new property and assigns it several values:

```
niutil -createprop .. /aliases/admins members root
celia george mary
niutil -read .. /aliases/admins
```

The output from the second command shows that the new property members has been created and assigned the values root, celia, george, and mary.

Note: Be very careful with createprop because it will overwrite an existing property that has the same key.

name: admins

members: root celia george mary

If you use the createprop option to set the value(s) of an existing property, that property is overwritten. For example, the following command overwrites the name property so this mail alias can be used with either lowercase or uppercase letters:

```
niutil -createprop .. /aliases/admins name admins
ADMINS
niutil -read .. /aliases/admins
name: admins ADMINS
members: root celia george mary
```

If you want to modify a domain and you are not logged into the server as root, you need to use the p option. When you use this option, you are prompted for the root password of the domain you're modifying:

```
niutil -create -t -p earth/super /aliases/engineers
Password:
```

Destructive Options

The final pair of options is used to destroy directories or properties: destroy for directories and destroyprop for properties. Be very careful with both of these-you don't get a chance to change your mind.

destroy

Sometimes you may need to eliminate an existing directory. For example, let's say you make a mistake while entering a command to create a new mail alias directory:

```
niutil -create .. /aliases/admisn
```

To destroy the offending directory so you can start over, enter the following:

```
niutil -destroy .. /aliases/admisn
```

Of course, you can also fix this situation by using createprop to overwrite the name property.

destroyprop

Sometimes you need to destroy only a specific property. For example, say you made the following mistake when trying to create the members property in a new mail alias:

```
niutil -createprop .. /aliases/admins root celia
george mary
```

As the output below shows, you've created a new property named root instead of a property named members.

niutil -read .. /aliases/admins
name: admins
root: celia george mary

You correct the situation by destroying the mistake and starting over:

niutil -destroyprop .. /aliases/admins root

Note: The following section pertains only to Mac OS X Server versions 1.x, which were released prior to May 2001.

Final Note:
There is a program very similar to niutil called "liutil". It works in pretty much the same way, but the "domain" argument is a path to a NetInfo database rather than a domain in the NetInfo hierarchy. For example, rather than:

niutil -list . /

You can do the same operation on your local database like so:

niutil -list /etc/netinfo/local.nidb /

It must be noted, though, that niutil should be used whenever NetInfo is running on the database you are editing. Specifically, you should not use liutil to edit /etc/netinfo/local.nidb unless you are in single user mode without having started nibindd (1100_DirectoryServices). liutil is particularly useful for editing the NetInfo database when nibindd can't start due to a misconfigured NetInfo database, (See Article 30767: **Mac OS X Server: "Cannot Connect to Network" Error)**. In particular, when NetInfo is set up to bind to a parent server (e.g. the "Use NetInfo" option in Setup Assistant) and there is no parent, you can use liutil to fix that up in single user mode, usually like so:

liutil -destroyprop /etc/netinfo/local.nidb /machines/broadcasthost serves

It is also useful for copying the template local.nidb and editing it for installation on a computer later.

Mac OS X: What is Lookupd?

Relatively few processes communicate directly with NetInfo. Yet, many processes need information that resides in NetInfo. How do these processes get that information? They use an intermediary: lookupd.

This article explains what lookupd is and what it does, and gives you some tips on spotting and fixing problems that involve it.
This article has been archived and is no longer updated by Apple.

What Is Lookupd?

Lookupd is a daemon that simplifies the tasks of the Unix-style library routines that need system and network administration information. These routines, such as getpwuid(), gethostbyname(), and getgrent(), are principally part of the C library (also known as libc). They access information like user names, computer addresses, and group IDs.

Lookupd gets information from NetInfo, the DNS, NIS, and the Unix-style system files. (The Unix-style system files are actually accessed as part of consulting NIS.) It uses Mach messages and SunRPCs to provide information to callers, usually libc routines.

Lookupd was created to avoid rewriting all the libc routines any time a new information service is added. If, for example, we wanted client processes to get network administration information from a relational database, we could modify lookupd so it referenced the information in the database. This would be easier than modifying all the appropriate libc routines to give them relational database access.

In addition to providing a centralized data access service, lookupd also caches some information. This caching improves system responsiveness and decreases network traffic.

When searching for information, lookupd consults its information sources in the following order:

1. lookupd's cache
2. The NetInfo domain hierarchy
3. The DNS, if appropriate
4. NIS

This search order applies in all of Apple's releases through Mac OS X Server. To find out about the DNS see Albitz and Liu 1992, and Nemeth, Snyder, and Seebass 1989; to find out about NIS see Nemeth, Snyder, and Seebass 1989, and Stern 1991.

Lookupd Caching

There are various types of lookupd caches, and each type is flushed and refreshed differently. The following sections provide details.

Password entries cache

One of the caches maintained by lookupd holds the information used by the getpwent() library routine. This routine lists the users known to the system (see Computer Systems Research Group 1986 and the system manual pages). lookupd can optionally cache the information it provides to getpwent(). The cache is enabled by default.

lookupd uses a "lazy refresh" on this cache. By default, lookupd loads the cache when it starts, normally at boot time. It then refreshes the cache only if the cache is referenced. At regular intervals, lookupd checks to see whether the cache has been referenced, and reloads it if it has. In addition, if the cache is referenced after a periodic check, lookupd sends the old data to the caller, then refreshes the cache. (See the lookupd(8) system manual page.)

To gain some perspective about this cache, consider that Mac OS X Server uses getpwent() only to complete a partial user name. For example, you can invoke this function in Workspace Manager's Finder by typing ~ followed by a partial user name, and pressing the Escape key. For example, if smarco is a user name, type "~smar", then press Escape. The Finder completes the name for you if the prefix you supplied is unique.

Logged-in user cache

The user information for the currently logged-in user and the root user are cached when someone logs in through loginwindow. lookupd refreshes this cache every 20 minutes and whenever the logged-in user changes his or her password. It clears the cache when the user logs out.

Local host information

The host information--host name and Internet address--for the local computer are cached when lookupd starts. If these change, lookupd must be restarted, typically by rebooting the computer.

Printers

Information regarding available network printers is also cached by lookupd. Each time the printer database is accessed through lookupd, lookupd verifies the validity of the cache by comparing the current checksums of the source databases with the checksums from when the cache was last loaded. If the cache is out of date, lookupd reloads it and sends the new data to the caller. If the cache is current, lookupd just sends the data from the cache.

Unix-Style Groups

The cache for Unix-style groups is maintained and consulted just like that for printers. It's referenced by the getgrent() library routine, but not by getgrnam() or getgrgid().

Other hosts

Lookupd maintains a one-record cache for information about computers other than the local computer. The cache contains the most recently referenced host name and Internet address. lookupd accesses the cache in response to calls to gethostbyname(), but not for calls to gethostbyaddr().

Mount points

The cache for mount points--locations for imported file systems--is like the cache for printers. It's accessed for calls to getmntent().

Looking It Up With Lookupd

Now let's examine what happens when an application makes a call to a library routine that provides system administration information. For this example, assume the application calls gethostbyname() to get information about a particular computer. The remote computer is Tute.EDU and is outside Rhino Aviation's network.

First, the application invokes gethostbyname(). This executes code in libc; the libc code checks to see if NetInfo is running. It is, so the libc code sends a Mach message to lookupd, requesting that a gethostbyname() operation be performed.

When it receives the Mach message, lookupd first checks to see if the request is for information about the local computer. It isn't, so lookupd then checks to see if the last host name referenced was Tute.EDU. If it was, lookupd would return the information from the cache. For this example, though, let's assume some other computer was referenced last.

Mac OS X Server lookupd consults NetInfo to get the information. This results in an NI_LOOKUPREAD SunRPC message to the local NetInfo server--netinfod local. Since the information isn't in NetInfo, this call returns an error and lookupd repeats the process, ascending the NetInfo domain hierarchy. This may require locating an appropriate NetInfo server, and so could require connecting or binding. (See "NetInfo Binding and Connecting.")

Since the information isn't in NetInfo and the application process is requesting machine-related information, eventually lookupd consults the DNS, using the normal resolver library routines. In this example, it finds the information in the DNS. It then returns the host information for Tute.EDU, using a Mach message, to the gethostbyname() libc routine. The libc routine then returns the information to the client application.

If the information hadn't been available from the DNS, then lookupd could have checked NIS, using the normal NIS semantics. At Rhino, though, NIS isn't used, so lookupd always stops with the DNS.

Managing Lookupd

Ordinarily, you may not have to deal with lookupd directly, so you don't need to do anything to manage it. However, if you want to know what lookupd is doing over time, it can log all requests it handles. You can also restart it if it's running into problems or if you need to refresh caches or tallies. The following sections explain how to work with lookupd.

Logging lookupd requests

Beginning in Mac OS X Server, lookupd can log information about requests it receives. You can set the logging option for lookupd in the system startup script /etc/rc. Logging is described fully in the system manual pages under lookupd(8).

For example, the arguments -L file cause lookupd to log information about requests it receives to the specified file. Logged information includes the called procedure, the number of calls to the procedure since lookupd started, the time required to process this request, and the total time consumed by all instances of this type of request. (Times are in microseconds.) When appropriate, the argument to the call is also logged, and the argument is prefixed with an asterisk if the data was retrieved from the cache. Example 1 shows an example of lookupd logging output.

Example 1: Logged information about lookupd

```
getservbyname Ncalls: 1 Elapsed: 78 Total time: 78
gethostbyname (rhino) Ncalls: 1 Elapsed: 32 Total time: 32
getservbyname (ntp) Ncalls: 2 Elapsed: 108 Total time: 186
getmntent Ncalls: 1 Elapsed: 3384 Total time: 3384
gethostbyname (sabre) Ncalls: 2 Elapsed: 18 Total time: 50
gethostbyname (ranger) Ncalls: 3 Elapsed: 51 Total time: 101
gethostbyname (*ranger) Ncalls: 4 Elapsed: 0 Total time: 101
setpwent Ncalls: 1 Elapsed: 24 Total time: 24
getpwnam (smarco) Ncalls: 5 Elapsed: 28 Total time: 46
setloginuser (672) Ncalls: 1 Elapsed: 64 Total time: 64
getpwnam (*smarco) Ncalls: 6 Elapsed: 1 Total time: 47
getmntent (*) Ncalls: 3 Elapsed: 39 Total time: 3461
gethostbyname (ranger) Ncalls: 5 Elapsed: 38 Total time: 406
getpwnam (*smarco) Ncalls: 7 Elapsed: 0 Total time: 47
getpwuid (*67) Ncalls: 8 Elapsed: 1 Total time: 27
initgroups (smarco) Ncalls: 1 Elapsed: 239 Total time: 239
getgrent Ncalls: 1 Elapsed: 1407 Total time: 1407
getpwuid (*0) Ncalls: 9 Elapsed: 0 Total time: 41
getpwnam (*root) Ncalls: 8 Elapsed: 0 Total time: 353
gethostbyaddr Ncalls: 1 Elapsed: 32 Total time: 32
getpwuid (22) Ncalls: 10 Elapsed: 27 Total time: 68
gethostbyaddr Ncalls: 2 Elapsed: 12 Total time: 44
getservbyport Ncalls: 1 Elapsed: 49 Total time: 49
```

Note: Since lookupd is invoked by `/etc/rc` at system boot time, you have to modify `/etc/rc` and restart the system to enable logging. You can't turn logging on and off dynamically in Mac OS X Server.

Restarting lookupd

Sometimes, you might want to restart lookupd. For example, you might want to force a cache to refresh, change the NetInfo servers being used, or reset the totals reported by the logging feature. You restart a lookupd daemon by sending it a "hang-up" signal, also called a SIGHUP.

To do this, first find the lookupd process ID number, using ps for example. Then, run the following command as root, substituting the process ID number for pid:

```
kill -HUP pid
```

This kills and automatically restarts lookupd.

If you were instead to try to restart lookupd by terminating it and rerunning the program, your computer would hang, because the library functions would be unable to contact the new instance. (If you ever find yourself in this state, reboot the computer.)

iMac: Update Fails Because Application Cannot Quit

I have an Epson printer and I had to reinstall my system software recently. Now I am trying to install the iMac Update but it continues to loop into a message asking me to quit other active applications. I continue to click OK but the message keeps coming up.
This article has been archived and is no longer updated by Apple.
Note: When the system software is reinstalled, any necessary system updates must also be reinstalled.

The installer requires that no other application programs be open before the iMac Update can be installed. It is likely there have been additional attempts to print so that there are items in the Epson printer queue. The Epson Monitor application will continue to relaunch as long as items are waiting to be printed.

There is no quit option available from the Epson Monitor application. The printer documents are stored in the Spool folder of the Epson folder inside the Extensions folder. Clearing the Epson Monitor of all the documents waiting to be printed or actually deleting all the documents from the Spool folder would allow the Epson Monitor application to quit.

One possible procedure would be to restart the iMac with the extensions off. The Epson printer drivers are no longer active and the iMac Update software should now install as intended. Once the iMac is restarted, the printer queue should automatically start up, because of all the documents left in its queue. You should also close any open windows when in the Finder.

Please contact Epson if further assistance is required on removing items from the Epson Monitor.

Apple Modems: Ringer Equivalency Numbers (REN)

This article lists the Ringer Equivalency Numbers (REN) of Apple modems.
This article has been archived and is no longer updated by Apple.
- Global Village Bronze: 0.7 (used on most Performas prior to 1995)
- Global Village Gold II for Performa: 0.8 (used on the Performa 6100 and some 630 series machines)
- Global Village Gold IIv (used in the Performa 6200 and 5300 series): 0.80
- Global Village Platinum V (used in the Performa 6300, 6320, 6290, and some 6400 series): 0.88
- GeoPort Telecom Adapter: 0.7 (stand-alone kit; also included with some Performa 6116s)
- GeoPort Telecom Adapter II: 0.5 (stand-alone kit)
- iMac Internal Modem : 0.3

iMac: Read Me

The following article contains important information about your iMac.
This article has been archived and is no longer updated by Apple.
This document contains important late-breaking information about your iMac computer, including:

Using Your iMac

- Starting up: Mac OS ROM and System Enabler 462 files
- Using the correct disk as a startup disk
- Restarting your computer
- Adjusting the volume for audio CDs and CDs with audio
- Using the iMac internal 56K modem
- Using the built-in speakers
- Using the built-in microphone
- Using infrared
- Working with a RAM disk
- Performance problems using Ethernet
- Determining the amount of Virtual Memory using Apple System Profiler
- Turning Virtual Memory off when installing third-party applications
- Allocating memory for third-party applications
- Performing a clean installation of software

Third-party Software Compatibility Issues

- Using up-to-date Internet browsers
- Using Netscape Navigator 4.0.5
- Installing third-party applications that install QuickTime
- Playing QuickTime movies via America Online
- Using FreePPP
- Using Norton Utilities

Third-Party Hardware Compatibility Issues

- Using Universal Serial Bus (USB) devices with your computer
- Printing to an HP670 printer using a Belkin F5U002 USB cable
- Using ADB dongles

For additional information, see Mac OS Help and the online documentation that came with your computer. Apple provides substantial information online. If you have access to the World Wide Web (WWW), you can check the latest information about the iMac in the support area at the following Uniform Resource Locator (URL): '**www.apple.com/support/imac**'

Using Your iMac

Starting up: Mac OS ROM and System Enabler 462 files

The System Folder contains two important files-Mac OS ROM and System Enabler 462. These files are required for your computer to properly start up. If you delete either of these files or move them to another folder, your computer will not successfully start up.

Using the correct disk as the startup disk

If you selected a CD as the startup disk in the Startup Disk control panel, and you start up your computer without a CD or with a CD other than the software install or software restore CD that came with your computer, a single folder with a reappearing question mark appears on the screen. The computer will then search for any available System Folder and start up. If no System Folder is available, you must insert the software install or software restore CD that came with your computer and restart your computer. If you do not want to start up from a CD, make sure you select the hard disk as the startup disk in the Startup Disk control panel.

Restarting your computer

If you are having problems with your computer, you can often eliminate the problem by restarting your computer, which clears the computer's memory. A restart allows you to save changes to any open documents and will close any open applications. To restart your computer, open the

Special menu and choose Restart, or press the power button on your Apple USB keyboard or on the front of the computer. A dialog box appears. Click Restart.

If your computer freezes while you are working, the power button may not restart your computer. (The Control/Command/power key combination used in earlier Macintosh computers will not work.) You may need to reset your computer manually. Open the cover on the side of your computer and locate the Reset hole (it's the upper hole on the right side, between the Ethernet and modem ports). Carefully insert the end of a large straightened paper clip into the hole and push gently. Do not use excessive force. Your computer should start up.

For more information, see the Emergency Handbook that came with your computer.

Adjusting the volume for audio CDs and CDs with audio

If you can not hear an audio CD or audio portions of a CD, check the volume level in the AppleCD Audio Player and set it to a higher level, if necessary. If you started up your computer from a bootable CD, the volume for the AppleCD Audio Player may be set to zero.

Using the iMac internal 56K modem

Setting up your modem

In most cases, before you can use your modem with a communications program or connect to an online service, you need to set up your modem. You may be asked for the following information:

- In the Modem control panel, make sure the option in the Connect via pop-up menu is "Internal Modem."
- The internal modem is called the "iMac Internal 56K."
- The modem initialization string "AT&F" will reset the modem to the default factory settings.

Note: You may be able to use this initialization string as the necessary setup information in a communications program that does not have the modem profile "iMac Internal 56K" in its list of modems.

- If your communications program has an option for hardware handshaking, turn it on. In some communications programs, this is called "flow control"; the option you select is "Hardware" or CTS & RTS (DTR).

If you have difficulty using a communications program, make sure you selected the correct port and modem name in the setup information. If problems persist, shut down your computer (from the Special menu, choose Shut Down). This turns off your computer and resets the modem. Then press the power button to turn your computer on.

Note: Restarting your computer will not solve the problem.

Having your computer go to sleep when using a communications program
---
Many communications programs can be set up to check the modem port for incoming calls. If so, your computer will not go to sleep automatically (after the specified interval in the Energy Saver control panel). For more information, see the documentation that came with your communications program.

Setting the modem connect speed for communications software

Communications programs may want you to set a maximum port speed as part of their setup procedure. The port speed indicates the speed that the computer communicates with the modem. In most cases, you want to set the maximum port speed to the highest speed available.

Sending commands to the modem using AT commands

You can send commands to the internal modem using a standard set of codes known as the AT Command Set. These commands are in the document "AT_Commands.pdf," located in the Internal Modem folder.

Using FAXstfTM with your modem

To quick fax from a third-party application other than the Fax application, a printer must be designated using the Chooser (from the Apple (□) menu, select Chooser). After selecting a printer, hold down the FAXstfTM "activation keys" to change the Print command to the Fax command.

Additional tips

Apple recommends that you don't open more than one communications programs at a time (for example, attempting to access an ISP when you're receiving or sending a fax). An error message may appear, or the application may freeze. Make sure that the communications programs, such as a

fax application, are not set to automatically answer incoming calls.

Recently the International Telecommunications Union (ITU), one of the organizations working on forming international standards for communications, announced the ratification of the V.90 standard for 56K modems. Previous to the ratification of the V.90 standard there were two proposed standards for 56K modems, x2 and K56flex. The iMac Internal 56K modem supports both the V.90 and K56flex standards. For more information on the V.90 upgrade, go to the support information on Apple's web site at: http://www.apple.com/support

Using the built-in speakers

The built-in speakers may distort louder audio sources. To avoid this, turn the volume down or use headphones or external speakers.

Using the built-in microphone

If you are recording sound using the built-in microphone and the background noise of the computer is in the recording, use another microphone to record, such as the Apple PlainTalk Microphone.

Using infrared

The Apple USB mouse has an optical sensor which can interfere with infrared transmissions. When you transmit information or connect to a network via infrared, make sure the mouse is not directly in front of the infrared port on your computer.

Working with a RAM disk

The RAM disk cannot be used as a startup disk. If you create a RAM disk, its icon will not be displayed in the Startup Disk control panel.

The contents of a RAM disk are saved to the startup drive when you restart your computer. The contents are restored, once the computer restarts. Large RAM disks may add additional time to shutting down and restarting the computer.

WARNING The contents of the RAM disk can be lost if:

- the startup drive is read-only, such as a CD-ROM disc
- the startup drive does not have sufficient space to store the contents of the RAM disk
- the startup drive does not have a valid System Folder
- the computer loses power

IMPORTANT It is highly recommended that you periodically back up the data on your hard disk to an external storage device or network file server.

Performance problems using Ethernet

If you experience performance problems on your Ethernet network, check with your network administrator. Your computer performs best when the Ethernet port is set to auto-negotiate.

IMPORTANT: The duplex mode of an Ethernet link to a switch is not detected if the port at the switch port is not auto-negotiating. If the switch port is not auto-negotiating, your computer will detect the appropriate speed but default to half duplex operation. If the switch port at the other end of the link is configured for full duplex operation, a large number of late events can occur on the link. Set the switch port to auto-negotiated operation where possible. If this isn't possible then set the switch port to half duplex operation. For more information, see the documentation that came with the Ethernet switch.

Determining the amount of Virtual Memory using Apple System Profiler
---
The Apple System Profiler 2.0.1 incorrectly calculates the current amount of Virtual Memory. To view the correct amount of Virtual Memory available, open the Memory Control Panel.

Turning Virtual Memory off when installing third-party applications
---
Some third-party applications may need virtual memory turned off in order to install the application properly. You can turn virtual memory back on after installation. For information on turning virtual memory off and on, see Mac OS Help.

Allocating memory for third-party applications

Some third-party applications may need to have more memory allocated to them in order for them to run or print properly. For information on increasing the amount of memory for an application, see Mac OS Help.

Performing a clean installation of software

Before you do a clean install of your system software, turn File Sharing off in the File Sharing control panel.

Third-party Software Compatibility Issues

Using up-to-date Internet browsers

Apple recommends that you use Netscape 4.0.5 or later, or Microsoft Internet Explorer 4.0.1 or later, both are included with your computer. If you use earlier versions, you may experience problems.

Using Netscape Navigator 4.0.5

To set a different home page using Netscape Navigator 4.0.5, you must use the Internet Config application. To do this, double-click the hard disk icon, then double-click the Internet folder icon. Double-click the Internet Utilities folder icon, then double-click the Internet Config folder icon. Double-click the Internet Config icon to start the application. Click the World Wide Web button. In the Home Page text box, type in the full text of the Universal Resource Locator (URL) of the desired home page.

Installing third-party applications that install QuickTime

QuickTime 3.0 is currently installed on your computer. Some third-party applications install QuickTime as part of their installation process. If an application installs a version of QuickTime earlier than QuickTime 3.0, make sure you do a custom install of the third-party application so you don't install an earlier version of QuickTime. If an earlier version of QuickTime is inadvertently installed on your computer, you can replace it by reinstalling QuickTime 3.0, located in the CD Extras folder on the iMac Software Install CD.

Playing QuickTime movies via America Online

To play QuickTime movies from the Internet using America Online, the QuickTime Plug-in, version 2.0 or later, must be in the AOL Plug-ins folder. You can download this plug-in from any QuickTime supported web site.

Using FreePPP

If your Internet Service Provider (ISP) requires that TCP/IP be configured for FreePPP, FreePPP starts and tries to connect when attempting to access a server via the Chooser. If this happens, you need to reconfigure the TCP/IP control panel. In the "Connect via" pop-up menu, choose AppleTalk (MacIP) or Ethernet built-in.

Using Norton Utilities

Norton Utilities 3.5.3 or earlier is not compatible with the new Mac OS Extended format of hard drives, also known as HFS+. Apple recommends using Disk First Aid 8.2 or later if you need to test and repair your hard disk. For more information, see the Emergency Handbook that came with your computer.

Third-Party Hardware Compatibility Issues

Using Universal Serial Bus (USB) devices with your computer

Some Universal Serial Bus (USB) devices may not be supported by the iMac because of recent changes in the USB Specifications.

Apple recommends that you do not plug in or unplug USB devices while you are using an application.

Printing to an HP670 printer using a Belkin F5U002 USB cable

If you've connected a Hewlett Packard HP670 printer to your computer using a Belkin F5U002 USB cable, when you attempt to choose the printer, a message appears saying the computer was unable to choose a printer. Do the following:

- Make sure the USB cable is firmly connected to the parallel port on the printer.
- Make sure the printer is turned on.
- Make sure the USB cable is firmly connected to a USB port on your computer.

Note: Apple recommends that you contact the printer manufacturer for their recommendation on what type of cable to use with their printer.

Using ADB dongles

Some applications require the use of an ADB (Apple Desktop Bus) dongle for security purposes to prevent software piracy. The iMac uses

Universal Serial Bus (USB) technology. You may be able to use a USB dongle with these applications. For more information, contact the software manufacturer.

LaserWriter 12/640: Disabling the Startup Page

I cannot disable the Startup page on my Apple LaserWriter 12/640 with the Apple Printer Utility. Each time I reboot the printer a Startup page prints.

Also when I relaunch the Apple Printer Utility the print startup page option is checked again.
This article has been archived and is no longer updated by Apple.
The Apple LaserWriter 12/640 will print a Startup page when powered on whenever the Communication Switch is in the "reset" or "factory default" position, that is the switch is in the "out" position.

If you do not want a Startup page to print when the printer is powered on, place the Communication Switch in the "normal" or "customize" location, in the "in" position, then via the Apple Printer Utility uncheck the checkbox for "Print a startup page each time the printer is turned on."

Note: When you try with the Apple Printer Utility to disable the Startup page when the switch is in the reset position, this dialog is displayed:

Warning:
Some settings will not be saved on the next power cycle. (See switch position)

If you receive this message, place the Communication Switch in the normal position sometime before restarting the printer to not print the startup page.

SCSI: Cable Connection and Termination

Questions and answers about SCSI cable connection and termination. The answers are most significant where users share SCSI devices.
This article has been archived and is no longer updated by Apple.
Question: Can a SCSI system cable with terminator remain connected to a Macintosh without the other cable end being attached to a SCSI device?

Answer: Yes, the SCSI can be terminated and connected. There shouldn't be any difficulties with this setup.

Question: If a SCSI peripheral is attached (for example, system cable to HD 80SC), can the SCSI extender or SCSI peripheral cable be attached to the last "real" SCSI device with the other end of the cable left unattached?

Answer: SCSI cables can be connected to the last SCSI device in the chain, provided they are terminated.

Question: Does a terminator go on the last device, or at the end of the last piece of cable?

Answer: As long as these cables are connected, they are considered part of the SCSI bus -- whether connected to a device or not. As part of the bus, you need to terminate the the last cable if not connected to another device.

iMac Discussion Board: Frequently Asked Questions (1 of 2)

This article contains frequently asked questions (FAQ) regarding iMac, with answers to those questions, and information regarding technical issues that may be encountered with an iMac. Additional iMac Discussion FAQs are listed at the end of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. My iMac has difficulties with sleep or the Energy Saver control panel. The computer does not sleep when I want it to, or fails to respond when it should wake from sleep.
2. Why does my USB mouse only move in one direction?
3. Why does my USB keyboard and mouse not respond?
4. I have my keyboard and mouse plugged into my USB hub and it does not work right. What's wrong?
5. The files in my windows are sorted in the wrong order. How do I change them back to the way I had them?
6. What causes the Type 12 error when I launch iMovie?
7. What other information is available on iMovie?
8. Can I use those business cards or other oddly shaped CD-ROM discs in my slot loading iMac?
9. Some of my DVD movies do not mount while others work fine. What causes this?
10. When I watch a DVD movie it skips occasionally. What can I do about it?
11. How can I improve the audio synchronization when I play a DVD movie?
12. A flashing question mark is displayed on the screen momentarily when the iMac starts up. It goes away but I was wondering why it happens and how to get rid of it.
13. My Control Strip moved up near the left center of the screen. How did it get up there? How do I move it back down?

Question 1: My computer has difficulties with sleep or the Energy Saver control panel. The computer does not sleep when I want it to, or fails to respond when it should wake from sleep.

Answer: Answer: Please refer to these articles:

TCP/IP: IP Addresses for Private Networks

This article tells how to configure a stand-alone TCP/IP network, or a network that is connected to the Internet using Network Address Translation.
This article has been archived and is no longer updated by Apple.
If you are not connecting to the Internet, you can use IP addresses from ranges having been reserved specifically for use on private IP networks. If you plan to connect your private network to the Internet using a router that supports Network Address Translation, also called NAT and "IP Masquerading." Please read the note at the end of this article.

An IP address is comprised of a network number and a node number; when selecting IP addresses for your network, computers on the same network segment, or "subnet", must have:

- The same network number: the portion of the IP address that represents the network number must be the same for all devices on the same network.
- Unique node numbers: the node number is what distinguishes one device from another.
- The same subnet mask: the mask is what determines how the IP address is subdivided into Network portion and Node portion.

This table assists you in selecting IP addresses for your Private IP network. This is not the entire range of addresses available for Private IP networks, just a subset.

Range (for a single subnet)	Default Subnet Mask	Class	Network # Portion	Node # Portion	Sample addresses for a computers on a single network segment*
10.0.0.0 through 10.255.255.255	255.0.0.0	A	10	0.0.0	10.0.0.1 through 10.255.255.254
172.16.0.0 through 172.16.255.255	255.255.0.0	B	172.16	0.0	172.16.0.1 through 172.16.255.254
192.168.0.0 through 192.168.0.255	255.255.255.0	C	192.168.0	0	192.168.0.1 through 192.168.0.254
192.168.1.0 through 192.168.1.255**	255.255.255.0	C	192.168.1	0	192.168.1.1 through 192.168.1.254

* When converted to binary, node addresses that are all zeroes (.0, or '00000000') and all ones (.255, or '11111111') are reserved for referring to the network itself, and for the network's broadcast address, respectively. So addresses 192.168.0.0 and 192.168.0.255 would not be available addresses for client workstations.

** There are many more Class C addresses available for Private IP networks: in fact, you can use any class C address in the range 192.168.0.x through 192.168.255.x (where x would represent the node ID, a number between 1 and 254); just remember that, with default subnet mask, the first 3 octets must be the same for all devices on the network (it is the first 3 octets that specify the network number for a Class C address).

Recommendation: Use a different Class C address for each subnet on your private Intranet.

Note: If your network is to be "hidden" from the internet by a hardware or software router that is configured for Network Address Translation (NAT, or "IP Masquerading"); your documentation for that product may suggest using one of these networks numbering schemes, too. Such a router has two (or more) IP addresses.

The IP address on the side of your router that connects to your Internet services (ISP or WAN) may be permanently assigned, or it may be assigned dynamically when your router connects. (DHCP or BOOTP protocols are commonly used to assign an IP address for dial-up, ISDN,

and cable modem connections.) The network interface on the local side of the router is an address within the range that all your other local machines use. Thus, the two interfaces on your router are on different logical networks, and may use different subnet masks, but ALL the addresses on the local side must be on the same logical network. This must be so in order that the local side of the router and your client systems may communicate with one another; it is then the router's job to pass traffic between the two different logical networks it serves -- yours, and the Internet.

It could be that additional routing needs to be done on the local side of your network. It then becomes possible that the subnet mask in use on your local subnet which connects to the outside-world router may require a subnet mask that is different from the one the router uses for its own port on your local subnet.

Your local network could be subdivided into several smaller networks by another router (such as another hardware or software router), or a server capable of routing. Such a server would have multiple ethernet ports configured, and might be a Mac OS X, Novell, or Windows NT server. On each resulting subnet, that subnet's lowest-number legal node address is usually assigned to the routing or gateway port by convention.

TCP/IP: Using TCP/IP Instead of AppleTalk on Your Network

Use this information when migrating from AppleTalk to TCP/IP on your network.
This article has been archived and is no longer updated by Apple.
Important: Before beginning, be sure not confuse the terms "AppleShare" and "AppleTalk." The information used in activities known as AppleShare and File Sharing is carried in "packets" across your network. These packets may be of the type "AppleTalk" or "TCP/IP."

First, you need IP addresses for each device on your network, which you must get from your network administrator or Internet service provider. If you are setting up a private IP network that will not be connected to the Internet, then see this technical document to determine what IP addresses to use.

Article 30821: "**TCP/IP: Setting up a Private Network**"

Second, set up each computer's TCP/IP control panel either via DHCP, via BootP, or manually, as appropriate for your network. If Configuring manually, you will need the following information:

- IP address
- Subnet mask
- Router's IP address (if any)
- Name server's IP address (if any)

Third, you'll need applications or processes that use TCP/IP. AppleTalk is the only protocol for File Sharing in Mac OS 8.6 and earlier and for many Apple LaserWriter Printers, so you would need alternatives to these. File Sharing in Mac OS 9 and later can be done using TCP/IP as an option in the File Sharing control panel. AppleShare IP server software allows you to share files using TCP/IP. It also includes TCP/IP services for email, FTP, web service, and Windows sharing (SMB).

Fourth: Printing. Many third-party printers and Apple's later LaserWriter printers support printing via LPR, a TCP/IP protocol. The method used to set up the printer with an IP address depends on the printer you have. You can search the Apple Spec Database and the Knowledge Base for more information on Apple printers.

To print via LPR, you will need a print driver that supports LPR. The Desktop Printer Utility included with Mac OS 8.1 and later supports LPR.

You need to determine which of your network applications use TCP/IP versus AppleTalk.

Drive Setup 1.6.1: Read Me

This document provides important information about Drive Setup 1.6.1.

Drive Setup installs software (called a disk driver) that allows your computer to communicate with the hard disk. Use Drive Setup 1.6.1 to update your disk driver or to reinitialize a disk. When you initialize a disk, all of its contents are erased. A version history is at the end of this document.

IMPORTANT: Earlier versions of Drive Setup can reintroduce issues resolved with Drive Setup 1.6.1.
This article has been archived and is no longer updated by Apple.

When to use Drive Setup 1.6.1

- Immediately after you set up your computer for the first time.
- Any time you install Mac OS versions 7.5.x, 7.6, 7.6.1, 8.0, 8.1 or 8.5 on your computer, you should use Drive Setup 1.6.1 to update the driver on your hard disk again. If you are using a version of Mac OS prior to 7.6, it is not necessary to use Drive Setup 1.6.1 to update your hard disk drive.

Note: Drive Setup 1.6.1 was tested with and is supported with System 7.5 through Mac OS 8.5.

At Ease and Drive Setup 1.6.1

If you are using At Ease 4.0, 4.0.1, or 5.0, and wish to update your hard disk driver using Drive Setup 1.6.1, please follow these steps before using Drive Setup 1.6.1. (If you are using At Ease 3.0 or earlier, these steps are not applicable.):

- Launch the At Ease Administration program.
- From the Security menu, choose System Settings.
- Make sure that the option "Prevent users from bypassing security by starting up from a floppy disk." is not selected.

Using Drive Setup 1.6.1 to Update a Hard Disk

This section describes how to use Drive Setup 1.6.1 to update your hard disk. You may have Drive Setup 1.6.1 on a CD or you may have downloaded Drive Setup 1.6.1 from an Apple Web site.

To use Drive Setup 1.6.1 to update your hard disk, follow these steps:

1. Back up your hard disk and turn off any hard disk security software. Using Drive Setup to update a hard disk driver with security software turned on may cause problems.

IMPORTANT: Apple strongly recommends that you make a copy of the information on your hard disk before you update the disk using Drive Setup.

2. Insert your system software CD in the CD-ROM drive and restart your computer using the CD.

Note: To learn how to start up your computer using a system CD, see the user's manual that came with your computer.

3. Locate Disk First Aid on the CD and open the program.

4. Select your hard disk and click Repair.

Note: Disk First Aid checks your hard disk and repairs problems it finds. For more information about Disk First Aid, see the user's manual that came with your computer.

5. When you have finished, quit Disk First Aid and restart your computer.

6. When your computer restarts, eject the system CD and use Drive Setup 1.6.1 as follows.

7. Open Drive Setup 1.6.1.

WARNING: When Drive Setup opens, do not click Initialize. Doing so erases all the information on your hard disk.

8. Select your hard disk in the List of Drives list.

9. Choose Update Driver from the Functions menu.

IMPORTANT: If Update Driver is not available, your hard disk may be protected by security software. See the manual that came with the software to learn how to turn off security while you update the disk.

10. Click OK when a message appears telling you that you must restart your computer.

11. Quit Drive Setup when you see the message, Driver update was successful.

12. In the Finder, choose Restart from the Special menu.

If you have problems or Drive Setup fails to update the disk, see the troubleshooting chapter in the user's manual that came with your computer.

IMPORTANT: If your computer has one or more previous versions of Drive Setup on the hard disk, Apple recommends that you replace these older version(s) of Drive Setup with version 1.6.1 of Drive Setup.

Recovering From Disk Problems
If, when you start up your computer using a system software CD, you see a message asking you to initialize your hard disk, do not click Initialize. It may be possible to recover the hard disk using Disk First Aid or another disk utility. To learn how to use Disk First Aid, see the troubleshooting chapter in the user's manual that came with your computer. If you are using another disk utility, see the manual that came with the software.

Initializing Your Hard Disk
If you need to initialize your hard disk, see the user's manual that came with your computer or the system software CD you are using to learn how to do so. When you are finished initializing and installing system software on your hard disk, use Drive Setup 1.6.1 to update your hard disk. See 'Using Drive Setup 1.6.1 to Update a Hard Disk' earlier in this document.

Tips and Troubleshooting

1) Update Driver command is dimmed

If the Update Driver command is dimmed, the desired disk is either not supported, or it's previously been updated with a non-Apple utility. If the disk isn't supported, check the instructions that came with your computer or disk to see if the manufacturer includes or recommends a disk utility, and use that utility to update the driver. If you have updated or formatted the disk with a non-Apple utility, you will need to use that utility again to perform the update. To ensure a successful update, obtain the latest version of the utility.

2) Using Drive Setup with Energy Saver

Before you use Drive Setup to perform an extended operation, such as testing the disk, open the Energy Saver control panel and select Never for the Hard Disk Sleep option to prevent the hard disk from spinning down before Drive Setup is finished.

3) Manually mounting volumes

Drive Setup allows you to partition a hard disk into several volumes when you initialize the disk. You can also select whether or not to mount a volume automatically when you start up your computer by using the 'Automount on startup' option. Beginning with Drive Setup 1.3, a more reliable method of mounting volumes automatically is being used, to ensure correct operation with virtual memory. You cannot use a disk utility program (for example, SCSI Probe version 4.3) to mount volumes manually if the program does not support the new way volumes are mounted. However, you can use Drive Setup to mount volumes manually.

4) Reinstalling Additional Software

Some computers come with additional software installed. If you want to reinstall this additional software using the 'restore' CD that came with your computer, quit Drive Setup before you reinstall the software. Icons will not appear on the desktop if Drive Setup is open when you reinstall the software.

5) Waiting for initialization to complete

Sometimes Drive Setup indicates that it has finished initializing a disk when it has not completely finished. Wait for your new volumes to appear in the Finder before continuing.

Improvements to Drive Setup (version history)

- Version 1.6.1 - Fixed a potential data transfer problem on the PowerBook 5300 and PowerBook 2300 operating in SCSI Disk Mode.
- Version 1.6 - Fixed a problem where ATA drives did not properly sleep. Also fixed a problem where Media bay devices were not properly reported on PowerBooks.
- Version 1.5 - Added support for Power Macintosh G3 computers. Fixed a problem where the write cache on some ATA drives was disabled following a restart.
- Version 1.4 - Added support for Mac OS Extended format for Mac OS 8.1. Supports all Macintosh computers that are supported by Mac OS 8.1 as well as all computers supported by Drive Setup version 1.3.x.

TA25229_Drive_Setup_Read_Me.pdf

- Version 1.3.1 - Fixed a problem on ATA drives that in rare cases could cause the loss of files/hard drive after a shutdown with Mac OS 7.6.1 and 8.0 systems.
- Version 1.3 - Updated to work with all Macintosh computers that are supported by Mac OS 8. Incorporates Mac OS 8 appearance. Takes full advantage of the increased throughput of Ultra SCSI-2 Fast/Wide drives.
- Version 1.2.5 - Limited release for Power Macintosh Workgroup Servers 7350 and 9650. NOT RECOMMENDED for other computers. Superseded by later versions.
- Version 1.2.4 - Updated to access drives with SCSI IDs greater than 7 (SCSI-2 Fast/Wide). Added the ability to repair a disk that is damaged by updating with Drive Setup 1.2.2 after initializing with Apple HD SC Setup 7.1.2 or earlier.
- Version 1.2.3 - Fixed a problem in which large reads and writes on the hard disks of Performa 6400 series computers could cause hangs. Added the ability to update from Apple HD SC Setup drivers.
- Version 1.2.2 - Improved recognition of secured volumes. Made minor changes for compatibility with the Mac OS 7.6 Installer.
- Version 1.2.1 - Limited release for a few Power Macintosh computers sold in some European markets. NOT RECOMMENDED for other computers. Superseded by later versions.
- Version 1.2 - Includes SCSI MESH patch for PCI Power Macintosh computers. Added support for selected 68k-based Mac OS computers with internal ATA hard drives.

IMPORTANT: Apple HD SC Setup should only be used with older 68k-based Mac OS computers.

Power Mac 8100/80AV: Mac OS 8.1 and PAL Video

I am doing video output work on my Power Macintosh 8100/80AV computer with Mac OS 8.1 system software installed. I noticed that the NTSC/PAL format options are not available on the "monitor and sound" control panel. Since my Power Macintosh 8100/80AV is NTSC/PAL video out capable, I would like to use this feature.

- How can I turn on this Video Display option?
- Is this fixed in Mac OS 8.5?

This article has been archived and is no longer updated by Apple.

With Mac OS 8.1, Monitors & Sound control panel version 1.3.3 is installed. This control panel does not provide any options for setting NTSC/PAL video out. These options can be set by installing and using the Monitors control panel which is installed in the Apple Extras->Monitors Extras Folder. Double-Click the Monitors control panel and click the "Options..." button. The user will be presented with the Video Display Options window. From here, a user should be able to select "Display Video on Television" in either NTSC or PAL Standard.

This feature has been added to the Monitors & Sound control panel that is installed with Mac OS 8.5. With Mac OS 8.5, Monitors & Sound control panel version 1.4.2 is installed. This newer version now includes a button called "Added Options...". By clicking this button the user will be presented with the Video Display Options window that will allow the user to select "Display Video on Television" in either NTSC or PAL Standard.

ARA Personal Server 3.0: Can‘t Be Set To Answer Calls

When I install Apple Remote Access Personal Server on a Power Macintosh running Mac OS 8, I cannot set my computer to answer calls. Call Answering does not appear in the Remote Access Menu. I also get the following error when opening Answering from the Remote Access Menu "There was a problem gathering information about Answering."

How can I enable call answering?
This article has been archived and is no longer updated by Apple.
The most likely reason that Call Answering is unavailable is that Apple Remote Access (ARA) Client (which does not include the Call Answering feature) is also installed. This can occur with Mac OS 8.5, 8.5.1, and 8.6, and ARA client versions 3.0, 3.1.2, and 3.1.3.

Many versions of Mac OS 8 include Apple Remote Access Client as part of the default installation. When you install Apple Remote Access Personal Server 3.0, it does not replace any ARA Client already installed. Because of this, Call Answering does not appear as an option. In some cases, you may see Call Answering but get error messages when trying to access Answering features.

To verify what's installed, you can use the Extensions Manager. Select as Packages from the View menu. Look for the ARA package, you will only want ARA 3.0 Personal Server present. If you see ARA Client, then you need to remove that software.

Extensions Manager

Note: The installer for ARA personal server installs modem scripts on your computer. Modem scripts with the same name as those installed by Personal Server 3.0 will be overwritten. The procedure below will restore any scripts that came with your computer. If you have problems with your modem after installing ARA Personal Server following this procedure, try downloading a new script from your modem manufacturer.

In order to use ARA Personal Server on a computer that already has ARA Client installed:

1. On the install disc that contains your system software, double-click the file named Install Remote Access. This file is located in the ARA Client Only or Apple Remote Access Client folder, either of which will be within the Software Installers folder.

2. Select Custom Remove from the pulldown menu.

3. Select the Apple Remote Access client for Power Macintosh.

4. Click Remove.

5. After the removal is complete, run the installer again.

6. This time choose Custom Install from the pulldown menu.

7. Select only the Remote Access modem scripts.

8. Click Install.

9. Restart

10. On the Apple Remote Access Personal Server CD, double-click the file named Install Remote Access.
This file is located in the ARA 3.0 Personal Server folder

11. Select Custom Install

12. Select all items in the list except the Remote Access modem scripts.

13. Click Install

14. Restart.

System Install/Clean Install Procedure
If you are installing Mac OS 8 on a computer on which you intend to use ARA Personal Server, be sure to click the "Customize" button on the Install Software screen, select custom installation from the pull-down menu to the right of the Apple Remote Access package, and choose only the Remote Access Modem scripts. Then install the Server, making sure to install only the server software and not the modem scripts.

Mac OS X Server: Basic Introduction To NetInfo Domains

This article is a brief introduction to NetInfo domains. It introduces new terms and the structure of the hierarchy.
This article has been archived and is no longer updated by Apple.

Introduction

A NetInfo domain is a hierarchical collection of NetInfo database(s) that provide system resources and network administrative information. This article discusses a three level domain hierarchy because it is the most common. The number of levels in the hierarchy is unlimited, but it is rare that more than three are needed. Below is of graphic a what a three-level domain may look like.

Figure 1 A three-level domain

Every computer that uses NetInfo has a local domain and a local database that is a repository of information that pertains specifically to that computer. The level above the local domain is usually called the network domain or network database and is a repository of shared system resources and administrative data. The next level is the root domain or root database and it is the repository of shared information for the entire network. So, each level of the domain has a corresponding database.

Processes

Also, each domain has its own server process that controls the domain. This process is called netinfod. When this process is viewed in ProcessViewer, and the Path & Arguments tab is selected, the domain the process serves is listed. On most computers it says netinfod local (master). If the computer is also a server for network domains it has processes for those. The computer serving /eng in the graphic has a netinfod local and a netinfod network process running.

Tags

Through out this article the terms local database and network database have been used. These are the *tags* (names) of the database. The local database tag is always "local" and the domain above the local domain is usually "network" (this is only by convention). The root database's tag is usually given a name that makes it easily identifiable, a school name, or business name. In this article the root domain's tag is Computers. A database tag is important when the hierarchy is being managed with NetInfoManager and command line utilities such as niutil.

Searching the Hierarchy

Before searching is covered a few more new terms are needed. The root domain is the *parent* domain for the entire network. The /eng and /mktg domains are the *children* of the root domain and the local domains are its *grandchildren*. Consequently, the /eng and /mkgt domains are parents for the local domains below.

When an application needs information it starts by searching the local NetInfo domain by contacting the netinfod for the local domain and the database is searched for the information. If the information is not the local database the parent netinfod process is contacted and its database is searched. This continues until the information is found and returned to the application or until the root domain is searched an no information is found. Thus domains at the same level are isolated.

In closing, domains are fundamental when constructing a NetInfo network. The domain structure can easily be made to mirror a company's internal structure keeping departments separate for security reasons, or they can mirror the company's physical layout such as regions, states, buildings and floors. Planning a domain map should be the first step of creating a NetInfo network.

AppleShare IP 6: PASS Protocol

Many email clients use the PASS protocol to change a user's password. Because it raises security issues, it is off by default and must be explicitly be enabled by the server administrator.
This article has been archived and is no longer updated by Apple.
Eudora & eMailer (and other email clients) use a protocol called "PASS" to change a user's password.

AppleShare IP 6.x comes with "PASS off by default. This is because "PASS" is a "clear-text" based protocol with limited security support. Because of this, it was decided to make the administrator explicitly enable this protocol.

To enable "PASS", go to the "Server" menu in the Mail Admin, choose "Advanced Settings" (The Mail Server must be running to do this.) and click on the "Protocols" tab. Make sure that the "PASS" protocol is enabled.

iMac: Use Mac OS Extended Format

You should format your iMac's hard disk using the Mac OS Extended format instead of the Mac OS Standard format.
This article has been archived and is no longer updated by Apple.
If you decide to reformat your iMac's hard disk, you should use Mac OS Extended format, sometimes called HFS Plus format, because it is more efficient than the Mac OS Standard format.

For more information on Mac OS Extended format, see the following Knowledge Base article:

Article 30344: "**Mac OS: About Mac OS Extended Format**"

Published Date: Feb 20, 2012

Mac OS: Print Window Command May Not Print Correctly

Icons and text may be clipped or simply not printed, when printing many items using the Finder's Print Window command.

Note: Updating to Mac OS 9.1 resolves this issue.

This article has been archived and is no longer updated by Apple.

Symptom

Icons and text may be clipped or simply not printed, when printing many items using the Finder's Print Window command. This may occur from all view options: Icons, Buttons, and List.

Solution

If you encounter this issue, you may be able to fully print the contents of the window by:

- Changing the View to another setting: Icons, Buttons, or List.
- If the View setting is as Icon, try selecting another icon size. (Choose View Options from the View menu.)
- If View is set as Icon, reposition the icons in the folder.
- Reducing the number of items in the folder before printing.

Note: These solutions may not work in all cases. Some window contents may continue to be clipped even when printed in list view.

PowerBook: Printing to an IrDA Printer

This article explains how to set up an IrDA-capable PowerBook to print to an IrDA-capable laser printer.

This article has been archived and is no longer updated by Apple.
First, make sure that your computer can communicate with the printer. Open the Infrared control panel to check that the computer "sees" the printer. Next, open the AppleTalk control panel and make sure that AppleTalk is set up to use the IrDA port. Lastly, follow these steps to create a new Infrared desktop printer with the Desktop Printer Utility:

1. Open the Desktop Printer Utility.
2. Choose New from the File menu; a window appears (see Figure 1).
3. Select "Printer (Infrared)" from the list and click OK; a window opens (see Figure 2).
4. Click the Change button; a window containing a list of available PostScript Printer Description files appears (see Figure 3).
5. Select your printer from the list and click Select. If your printer does not appear in the list, select Generic (you may want to contact the printer manufacturer for their PostScript Printer Description (PPD) file).
6. Choose Save As from the File menu and save the printer file as a desktop printer.

The icon of your newly created desktop printer appears on the desktop.

Mac OS: What is a Memory Leak?

This article defines the term "memory leak."
This article has been archived and is no longer updated by Apple.
A memory leak refers to memory that is not released by an application program when the program no longer needs it. This can lead to a crash or to the program displaying an out of memory message.

To resolve a memory leak, increase the amount of memory that a program uses (to delay the effect of the leak) or get an updated version of the program that has been corrected.

AppleShare IP 6.x: IMAP with Netscape Communicator 4.5

This article discusses compatibility of AppleShare IP (ASIP) 6.x and the IMAP client in Netscape Communicator 4.5.
This article has been archived and is no longer updated by Apple.
ASIP 6.0 and the IMAP client in Netscape Communicator 4.5 are not compatible.

In addition, there is a problem with Netscape Communicator 4.5 and AppleShare IP 6.1 IMAP support. Although the AppleShare IP 6.1 Mail Server supports nested IMAP folders, Communicator will not properly display these nested folders. The folders are still present and all mail in them is still intact -- the nested folder simply fails to appear in Communicator's mailbox browser. If your AppleShare IP mail account contains nested folders, you will not be able to access them with Netscape Communicator 4.5.

At this time Apple recommends the use of other IMAP clients for access to nested folders. The AppleShare IP 6.1 Mail Server is fully compatible with a number of other IMAP clients offering full support for nested folders, including Netscape Communicator 4.04.
Published Date: Feb 20, 2012

AppleShare IP Print Server‘s Log: Number Of Copies

The ASIP Print Server's Log sometimes lists the number of Copies printed in a print job and other times recorded is N/A. Why the inconsistency?
This article has been archived and is no longer updated by Apple.
The ASIP Print Server's Log will record the number of Copies printed as N/A if the print job was created by a LaserWriter driver older than LaserWriter 8, version 8.6, or possibly by a PostScript driver on another type of computer other than a Macintosh.

LaserWriter 8.6 includes a new DSC comment, %RBINumCopies, in the print job listing the number of Copies to be printed that a spooler or document accounting program could look for and log.

Therefore, when the number of Copies in the Log reads N/A, the job was created by an old printer driver. If a numeric value is given for the number of Copies, the print job was created by LaserWriter 8.6 or newer.

iMac: Troubleshooting "No Video" Issues with an External Monitor

One of the troubleshooting techniques used is to attach an external monitor. If there is no video on the external monitor, then the fault is generally assumed to be in the logic board area while the presence of a clear external video signal indicates a fault with the analog board.

However, if the wrong type of monitor is attached to the iMac, it produces no video even if the can is generating a valid video signal and thus leading to an inaccurate diagnosis of the situation. Apple has seen a number of service providers who have attached older monitors that do not produce a signal on the iMac leading them to replace multiple working parts in search of the fault.

This article has been archived and is no longer updated by Apple.
This article covers repair procedures for authorized service providers on selected Apple products, but we have published them in the Knowledge Base for the general public for educational purposes. At this time, there are a limited number of repairs that a customer can perform and these are covered under the customer installable parts program http://www.info.apple.com/installparts. If you have not been authorized to perform these procedures, please contact Apple (800-APL-CARE in the USA) or your local authorized service provider to schedule a repair.

DANGER! This procedure exposes you to high voltages that can result in death or serious injury. DO NOT ATTEMPT THIS PROCEDURE IF YOU HAVE NOT BEEN CERTIFIED AS AN APPLE-AUTHORIZED TECHNICIAN.

Symptom

No video

Solutions

Symptom

1. On the original iMac, connect an external monitor (to the connector located on the audio/video interconnect board) to determine whether the issue is in the logic board/mass storage chassis (can assembly) or in the head area (CRT, power supply, analog board). If there is no video on the external monitor, then the fault is generally assumed to be in the logic board area. The presence of a clear external video signal indicates a fault with the analog board. Note: On iMac computers with a video out port, connect the monitor directly to the video out port.

2. Make sure to connect a display that produces video at and supports the resolutions listed below. If the wrong type of monitor is attached to the iMac, it produces no video even if the logic board/mass storage chassis (can assembly) is generating a valid video signal and thus leading to an inaccurate diagnosis of the situation. Apple has seen a number of service providers who have attached older monitors that do not produce a signal on the iMac leading them to replace multiple working parts in search of the fault.

The iMac is capable of producing video only at the following resolutions:

640x480 at 117Hz

800x600 at 95hz

1024x768 at 75hz

Monitors, such as the older sync on green monitors, produce no image when attached to the iMac. Newer monitors that are fixed resolution monitors, even though they may work on a Power Macintosh G3, do not produce a good image on the iMac.

In order to use an external monitor as a troubleshooting aid, the monitor must be one of the newer multiscan, AppleVision, or ColorSync monitors.

Note: If you are still experiencing video problems, refer to:

Apple Studio Display 15" LCD: Windows 4.0 Server Installation

I am trying to install the driver for the Apple Studio Display 15" LCD on a Windows NT 4.0 server. When installing, a message is displayed stating a later version is required for this machine. Is there a later version?
This article has been archived and is no longer updated by Apple.
There is no need to install this file on Windows NT 4.0.

Windows NT 4.0 does not use this file since it only allows you to select information about the adapter and does not allow you to select the type of monitor that is attached. Windows NT allows you to select the scan rate manually. Just set the desktop area and scan rate to one supported by the Apple Studio Monitor. 1024 x 768 with a scan rate of 75 Hz is a good setting. Supported settings are listed in the manual for the Apple Color Studio display.

Note: The word driver here is incorrect. The only software to install is the Applemon.inf file on the CD. This is actually a text file that lists settings supported by the monitor. Windows 95 uses this to control what settings it makes available to the user in the Display control panel. For example, Windows 95 automatically adjusts the scan rate based on information in this file when you change resolutions.
Published Date: Feb 20, 2012

Network Printer Missing: Running Windows NT

We have an Apple LaserWriter printer on a network with Macintosh and PC-compatible computers, including an NT server. We have always been able to see LaserWriter printer, but after installation of the NT server, the Apple printer no longer shows up in the Chooser.
This article has been archived and is no longer updated by Apple.
Your NT computer has most likely been configured to capture the printer. When setting up a printer on an NT workstation the printer capture option defaults to on. Capturing the printer hides the printer from the Chooser. On Windows NT Server computers, with Services for Macintosh (SFM) installed, this is intended to force users to print through the NT Server. On Windows NT Workstation computers, which lack Services for Macintosh, this prevents computers from seeing the AppleTalk printer entirely with no option to print through a server.

If the printer has been set up via AppleTalk on the Windows NT computer:
1) Go to the printer's Properties
2) Click on the 'Ports' tab
3) Click on 'Configure Port...'
4) Uncheck 'Capture this AppleTalk printing device'

For more information about Windows NT printing services, contact your network administrator, Microsoft, or check your Windows NT documentation.

Power Macintosh G3 (Blue and White): Use Proper CD/DVD Headphone Jack & Volume Adjustment

I have a Power Macintosh G3 (Blue and White) computer, and when I try to plug a headphone into the jack on the front of the CD drive, it does not fit.
This article has been archived and is no longer updated by Apple.
The port and volume adjustment control on the front of the CD or DVD drive are not intended for use on these computers. Instead, there is a line-out connection on the back of the computer for external speakers or headphones.

Volume control is adjusted in the control strip module or in the Sound control panel. These should be used to adjust system sounds, rather than the volume adjustment control on the front of the CD or DVD drive.

Disregarding this advice and attempting to use the volume adjustment control on the front of the CD or DVD drive may cause damage to the drive bezel.

Published Date: Feb 20, 2012

Power Macintosh G3 (Blue and White): Apple DVD Player Cannot Open

I just received my Power Macintosh G3 (Blue and White), and when I try to launch Apple DVD Player from the Apple menu, I get the following error message:

"Apple DVD Player can not open because the required hardware was not found. If you have another application open that uses sound or video, quit that application and open Apple DVD Player again. If you are using a PowerBook, make sure your PC card is installed in the bottom slot. (216)."

The only option is to Quit.
This article has been archived and is no longer updated by Apple.
This error message is expected behavior if either the DVD drive or the decoder card (for decoding MPEG-2 and AC-3 data) are not present. If the Power Macintosh G3 (Blue and White) was purchased from Apple, either as a standard configuration or Build-To-Order, with a DVD drive as part of the configuration, the decoder card would be included by default (present as a daughtercard on the ATI Rage 128 video card).

Is the Appropriate Hardware Present?
In order to play a DVD movie, a computer must have a DVD-ROM drive and a DVD Decoder card installed. Typically, the presence of a DVD-ROM drive can be determined by looking at the label on the tray which a DVD/CD would sit in. If the drive is DVD capable, you will see DVD stenciled on the tray.

To determine the presence of a DVD-Decoder in your Power Macintosh G3, use the Apple System Profiler version 2.1 or greater. Specific information for the different Power Macintosh G3 series computers follows. If you are running Mac OS 8.1, you will need to download an updated version of the Apple System Profiler from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Power Macintosh G3 (Platinum): Open the Apple System Profiler. Under the System Profile tab, click the triangle to expand the Hardware Overview information. Under this heading you will see either Personality Card or an Attributes topic with a description of the card next to it. If it's a DVD card, it will say "Apple Audio/Video DVD Card." If it does, the DVD Decoder is installed.

Power Macintosh G3 (Blue and White): Version 2.2 of the Apple System Profiler, which is included with Mac OS 8.6, can be used to determine if the DVD Decoder is installed in the G3 Blue and White. Open the Apple System Profiler. Under the System Profile tab, click the triangle to expand the Hardware Overview information. Under this heading you will see the Attributes topic, with the wording "DVD decoder present". If you are running Mac OS 8.5.1, you will have to visually identify whether the DVD decoder is installed. This can be done by opening the side door on the computer and looking to see if there is a small daughter card attached to the video card. The daughter card is the DVD decoder, and if it is present we will assume that it is available for use.

Are the Appropriate Software Components Installed and Active?
The Power Macintosh G3 requires that the following extensions be present and active in order to view a DVD Movie:

- Apple CD/DVD Driver
- ATI Driver Update
- ATI MPP Manager
- ATI Resource Manager
- DVD Decoder Library
- DVD Region Manager
- QuickTime
- QuickTime PowerPlug
- UDF Volume Access
- Video Startup

The Extensions Manager can be used to create a minimal extensions set in order to view DVD Movies. Refer to article 30929: "**Mac OS 8.x: Extensions Troubleshooting/Extensions Manager Features**" if assistance is required in creating a custom set within the Extensions Manager.

If a DVD drive is present and this error message persists:

1. Clean the disc with a soft, lint-free cloth.

2. Turn off AppleTalk in the AppleTalk control panel or the Chooser.

3. Quit out of all open applications and attempt to launch Apple DVD Player again.

4. If the error message persists, restart the computer and attempt to launch Apple DVD Player again.

5. Have you selected a remote volume to auto-mount on startup? If so, use the Chooser to navigate to that volume by logging on to the file server, and when presented with the list of volumes on that server, deselect the checkbox next to the volume name. Repeat this step for all volumes set to auto-mount on startup. Restart the computer, and attempt to launch Apple DVD Player again. For more information on this topic, please see article 30970: "**Apple DVD Player: Conflict If Servers Mounted at Startup.**"

6. If the error message persists, check to see if QuickTime 4 is installed. If it is, make sure that either the Full or Custom install has been performed. See article 58381: "**QuickTime 4: Common Issues After a Basic Install**", for additional information.

7. If the error message persists:

- Go into the Extensions Manager control panel (under Apple Menu->Control Panels).
- Go to View menu and choose View...as Packages.
- Go to the Selected Set pull-down menu, choose Mac OS 8.5 All. On the lower right side of the control panel there is a button saying "Duplicate set." Click on it; name the duplicate set "DVD."
- Scroll through the packages listed, and click once in the box to the left of Power Macintosh G3 2.0, turning the entire package on. Do the same for the packages ATI Multimedia Component and Apple DVD Software 1.1.
- On the lower left side of the control panel is a button saying "Restart." Click on it.
- If the issue is resolved, troubleshoot the issue by identifying the extension causing the conflict.

8. If the issue is not resolved by setting extensions to Mac OS 8.5 All + Power Macintosh G3 2.0 [package], delete the Apple DVD Player preferences. They are in the System Folder in a folder named Preferences. Then restart the machine.

9. If the error persists, reinstall the Apple DVD Player application from the software CD that came with your Power Macintosh G3. The DVD Player does not have a separate installer on the CD. Delete the folder containing the Apple DVD Player application (in the Applications folder), and from the CD window, open Apple Software Restore. Select the option for Restore in Place.

10. If Speech Recognition is installed and listening is turned on, Speech Recognition will take control of the sound input source. To properly play the DVD movie, turn off Speakable Items.

11. Lastly, there may be difficulties with the System file or another file in the System Folder. Use your system CD to perform a clean install of the system software. You can find the clean install option by clicking the Options button in the Installer.

For more information on how to perform a clean install, see article 58176: "**Mac OS 8.5/8.6: Performing A Clean Install**"

For more information on how to troubleshoot an extension conflict, go to the Help menu (when in the Finder) and open Mac OS Help. Search for information on Resolving Extension Conflicts.

VGA Port: Pinout Description

This article provides descriptions of the signals present on the standard analog DB15 video connector, otherwise known as VGA.

Note: The pinout descriptions in this article do not apply to the digital video connector.

This article has been archived and is no longer updated by Apple.
The analog video connector on many Apple computers is a standard DB15 (also called D-sub-15) connector, which is used with VGA, SVGA, or XGA monitors. Figure 1 shows the pin configuration and the table lists the signal pin assignments.

Figure 1 VGA connector

PIN	SIGNAL NAME	DESCRIPTION
1	RED	Red video signal
2	GREEN	Green video signal
3	BLUE	Blue video signal
4	MONID(0)	Monitor ID signal 0
5	GND DDC	Return
6, 7, 8	AGND_VID	Analog video ground
9	+5V_IO 5 V	Power for I/O device
10	GND	HSYNC and VSYNC ground
11	VGA_ID	VGA ID signal
12	MONID(2)	Monitor ID signal 2
13	HSYNC	Horizontal synchronization signal
14	VSYNC	Vertical synchronization signal
15	MONID(1)	Monitor ID signal 1

PowerBook G3 Series: GV fax 2.6.5 and DVD Incompatibility

When I play a DVD movie, I cannot hear any sound.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.
This article has been archived and is no longer updated by Apple.
If you have installed the GlobalFax Software for the PowerBook G3 Series and have it set to auto receive faxes, it will change the sound in source to internal modem.

There are two workarounds for the customer:
1) Change the sound in source to Zoomed Video after launching the Apple DVD Player
2) Turn off the Receive Fax option in the GlobalFax settings.

Remote Access: Modem Not Responding Alert

This article discusses a Remote Access alert when receiving an incorrect response, or no response, from the modem.

This article has been archived and is no longer updated by Apple.

Symptom

When Remote Access receives an incorrect response, or no response, from the modem, the connection attempt fails with the "modem not responding" alert:

Figure 1: Apple Remote Access alert

Solution

Use the following troubleshooting path to identify the source of the failure. If Open Transport/PPP is installed, substitute "PPP control panel" for "Remote Access control panel" throughout.)

1. Reset the modem and check connections

"Check connections" in the alert refers to the modem's connection to the computer, not the telephone outlet. This is not easily checked for internal modems, but for external modems, check the modem and power cables for secure connections and signs of damage. This is especially important if the symptom is intermittent or can be caused by moving the modem or its cables. If the modem normally provides any visual signs that it is turn on, such as illuminated LEDs, check for them.

- External modems: press the modem's reset button if it has one, or turn it off for at least 15 seconds. If the modem does not have its own power cord, it draws power from the computer. In this case, disconnect the modem from the computer.
- Internal modems: shut down the computer for at least 15 seconds.

2. Set up the Modem control panel

Set up the Modem control panel to use the appropriate modem script. Apple internal modems use the following scripts:

- Power Macintosh G3 (Blue and White): Power Mac G3 Internal 56K, Power Mac G3 Int56K (v.34 Only) (See Note 1)
- PowerBook G3 Series: PowerBook G3 Internal 56K, PowerBook G3 Int56K (v.34 Only) (See Note 1)
- iMac: iMac Internal 56K, iMac Internal 56K (v.34 Only) (See Note 1)
- Power Macintosh G3 and Power Macintosh 6500: Apple/GV 56K (See Note 1)
- PowerBook 3400 and PowerBook G3: PowerBook 3400/G3 Internal 33.6 (See Note 1)
- GeoPort Telecom Adapter (internal or external): GeoPort/Express Modem (See Notes 1 & 2)
- Power Mac G4 (AGP Graphics): Apple Internal 56K Modem (v.34) (See Note 1)
- Power Mac G4 (AGP Graphics): Apple Internal 56K Modem (v.90) (See Note 1)

Notes:

1. When setting up the Modem control panel, ensure the "Connect via" selection is pointing to the correct port or modem.
2. GeoPort/Apple Telecom hardware and software are not supported under Mac OS 8.6 and higher.

Figure 2: Modem control panel

3. Set up the Remote Access control panel and test

- Open the Remote Access control panel. Enter any name (user ID), password, and telephone number.

Figure 3: Remote Access control panel

- Click Connect. If the symptom persists, continue to the next step.

4. Use the Mac OS All set in the Extensions Manager control panel

Open the Extensions Manager control panel and choose the Mac OS All set from the Selected Set menu (see Figure 4). For example: Mac OS 8.6 All, iMac All, and so forth.

Figure 4: Extensions Manager control panel

If the modem requires any extra extensions (excluding fax or telephony extensions), they are installed and enabled if the checkbox next to their name is selected. Extensions Manager asks to duplicate the Mac OS All set before additional extensions can be enabled. Click OK.

Modems that came with Apple computers require the following extensions:

- Apple 56K modem (but not Apple/GV 56K modem) depending on the computer::
  - iMac Modem Extension
  - Power Mac G3 Modem
  - PowerBook G3 Series Modem
- GeoPort Telecom Adapter:
  - Apple Telecom Modem
  - Express Modem Tool
  - GeoPort for Power Macintosh
  - GeoPort Telecom Adapter
  - GeoPort Serial Driver
  - Serial Extension (PM 6100/7100/8100 only)
  - Shared Library Manager
  - Shared Library Manager PPC
  - Express Modem control panel.
- PowerBook 3400/G3 Internal Modem/Ethernet 33.6 card:
  - PowerBook 3400 Ethernet extension
    and
  - PowerBook 3400 Modem extension
    or
  - PowerBook 3400/G3 Modem extension only

Close Extensions Manager and restart the computer. Any extensions that may have captured the modem port are disabled and remain so until reenabled in Extensions Manager.

After restarting, open the Remote Access control panel and click Connect. If the symptom does not recur and the modem works correctly, perform extensions troubleshooting to isolate the extension or extensions causing the symptom. If the symptom persists, continue to the next step.

For more information on troubleshooting extensions, please see article 30929: "**Mac OS: Extensions Troubleshooting/Extensions Manager Features.**"

5. Reset Parameter RAM

Choose Restart from the Special menu, then immediately press and hold down the Option-Command-P-R keys on the keyboard. Continue pressing the keys until the computer chimes or restarts twice. This will not work if the Caps Lock key is depressed, and may not work with non-Apple keyboards.

Open the Remote Access control panel and click Connect. If the symptom does not recur, it indicates there was a conflicting setting in Parameter RAM. Perform extensions troubleshooting, but the fault may not return, even after reenabling the extensions.

For more information on resetting Parameter RAM, please see article 2238: "**Macintosh: How to Reset PRAM and NVRAM.**"

6. Delete preferences

Damaged Remote Access preferences may be at fault and are easy to confirm prior to additional troubleshooting.Depending upon your connection method, move these preference files to the desktop:

- Remote Access users:

  - System Folder : Preferences : Modem Preferences

  - System Folder : Preferences : Remote Access : Remote Access Connections

- Open Transport/PPP users:

  - System Folder : Preferences : Modem Preferences

  - System Folder : Preferences : PPP Preferences

Repeat steps 2 and 3 to set up the control panels and test. If the symptom persists, the preferences were not at fault. To reclaim the information they contained, move them back to their original locations and allow them to replace the newer preference files.

7. Use Apple Hardware Test

If the computer came with Apple Hardware Test, start up from the Apple Hardware Test CD-ROM disc and open the Quick or Extended tests. If the Apple Hardware Test detects a modem error, note the error code, and contact Apple or an Apple Authorized Service Provider.

Apple Hardware Test is included with the following computers:

- iMac (Summer 2000)
- Power Mac G4 (Gigabit Ethernet)
- Power Mac G4 Cube
- PowerBook (FireWire)

8. Reinstall the modem software, if applicable

This issue deals with software required to enable even the barest functionality. Many modems don't require specific software for a data connection. Such software is needed usually for faxing or telephony (using the modem for voice calls). However, a modem might require an extension to enable data compression and error correction.

- If the modem requires basic software, check with the manufacturer for a newer version. GeoPort Telecom Adapters users, for example, sometimes install older versions of Apple Telecom.
- If the modem requires basic software and the modem was working successfully before, the software may be unusable. Reinstall the modem software. For Apple modems, this would include the GeoPort Telecom Adapters. For other Apple modems, continue to the next step.
- Also, ensuring the modem software or extension software is correctly configured may resolve the issue.

9. Perform a clean installation or clean restore

Perform a clean install or clean restore of the operating system. If there is any connectivity or modem software to be installed separately, do so immediately afterward.

Repeat steps 2 and 3 to retest. If the issue still exists, a hardware repair may be necessary. When using an external modem, the condition may be further isolated between the computer and modem by testing the modem on another computer, or confirming that other devices work on the modem port of this computer.

If the issue persists after performing the above steps, contact the modem manufacturer for further troubleshooting assistance. If the modem was manufactured by Apple, seek service from an Apple Authorized Service Provider or contact AppleCare for service instructions.

Power Macintosh G3: Rebuilding the Desktop can disable Iomega Driver extension

On a Power Macintosh G3 that includes an Iomega Zip Drive, it is possible to disable the Iomega Driver extension when holding down the Command and Options keys to rebuild your desktop.
This article has been archived and is no longer updated by Apple.
When holding down the Command-Option keys, through the entire boot sequence, the Iomega Driver extension is temporarily disabled. Inserting a Zip disk would result in the disk not appearing on the Desktop.

There are three workarounds for this problem:

- If you are attempting to rebuild the Desktop on your Power Macintosh G3, wait until all extensions are loaded before you press and hold down the Command-Option keys. An easy way to determine this is to wait until the progress bar under the Mac OS logo is almost completely to the right side.
- If you have already rebuilt the Desktop on your Power Macintosh G3, you can load a temporary driver by launching the Iomega Guest application. This application is typically located in the Utilities folder within the Iomega folder.
- After the Desktops rebuild is complete, restart your Macintosh.

iMac: Resetting the CD-ROM Eject Mechanism

After ejecting the iMac's CD-ROM tray by using the manual eject hole, the eject mechanism may require resetting before the tray latches properly.

This article outlines a procedure that may be used with those customers who feel comfortable performing the procedure. Any Apple Authorized Service Provider can perform the procedure.
This article has been archived and is no longer updated by Apple.

Tools

One straightened paper clip or similar tool.

1. Place the iMac on its left side (when facing the computer) on a non-abrasive surface to prevent scratching the case.

2. Hold the CD-ROM tray open such that the bottom of the tray is visible. Be careful not to touch the lens on the other side. See Figure 1.

Figure 1 Eject Mechanism

3. Move the exposed tab of the eject mechanism toward the CD bezel as shown in Figure 2. Continue until it clicks into position. The eject mechanism is now properly engaged.

Figure 2 Eject Mechanism Reset

As the eject mechanism is engaged, the small, forward portion of the mechanism becomes exposed as shown in Figure 3.

Figure 3 Eject Mechanism Gap

4. If the eject mechanism does not engage, ensure that the small gap between the tray bezel and the metal housing is clear of obstructions. See Figure 4.

Figure 4 Engaged eject mechanism and small gap

If the CD-ROM tray still does not latch closed, the iMac requires service. An Apple Authorized Service Provider can remove the drive and repeat the procedure, or replace the drive if that fails.

PowerBook G3 Series: Displaying Video In Simulscan Mode

Sometimes when trying to watch QuickTime movies on both the PowerBook display and an external monitor (in Simulscan mode), the video only shows up on the PowerBook display. Why is this?
This article has been archived and is no longer updated by Apple.
The second generation PowerBook G3 Series have the ATI LT Pro video hardware which is capable of displaying multiple resolutions on the built-in PowerBook display. If the ATI Driver Update 1.4.7 or later is installed, this computer is capable of displaying the same image on the internal screen and an external monitor at multiple resolutions.

However, when viewing some QuickTime movies or DVD video, the video may only show up on the PowerBook display if the simulscan resolution is not the "native" resolution.

On a 14" or 13" display, the native resolution is 1024 x 768. On a 12" display the native resolution is 800 x 600. So to resolve the issue, change the resolution to the native resolution for your screen size.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

Displays: Using the Ambient Light Tool

What is the ambient light tool and how do I use it with my monitor?
This article has been archived and is no longer updated by Apple.
ColorSync capable displays ship with a lollipop-shaped device, called the ambient light tool. This tool is used to measure the lighting conditions surrounding the display, so that the display can adjust itself for accurate color matching. The tool has a reflective surface which changes color depending on the surrounding lighting conditions.

Figure 1, Ambient Light Tool

To create an ambient light setting:

1. Open the Monitors and Sound Control Panel and click the Color button. To get truer color rendering, you should set a white point for the monitor before correcting for ambient light.

2. Set the monitor to millions of colors.

3. From the Ambient Light pop-up menu, choose Custom.

4. Because your monitor needs to be calibrated, a dialog box appears asking if you want to recalibrate now. Click OK. (The screen will flash for a minute or two while the monitor recalibrates.)

5. You will then be presented with a palette of color samples. Hold the ambient light tool up to the screen and select the sample that best matches the light tool.

6. If none of the predefined color samples match the light tool to your satisfaction, select the sample that is closest to a match, then click the More Choices button. Drag the Brightness slider (above the color triangle) until the color sample matches the ambient light tool exactly. (When the tool and the sample match, the circle in the center of the tool seems to disappear.)

7. Click Save. Give the current setting a name and click Save. This name should show up in the Ambient Light menu as the currently selected setting.

To use an ambient light tool setting:

1. Open the Monitors and Sound Control Panel and click the Color button.

2. Choose an ambient light setting from the Ambient Light pop-up menu. If you haven't created any custom ambient light settings, then Custom or None will be the only choices available in the menu. Follow the previous steps to create a setting.

To modify an ambient light setting:

1. Open the Monitors and Sound Control Panel and click the Color button.

2. Open the Ambient Light pop-up menu and choose the custom ambient light setting that you want to modify.

3. Then open the Ambient Light pop-up menu again, and choose the Modify command at the bottom of the menu. (The Modify command should include the custom ambient light setting you selected.)

4) Follow steps 5 and 6 above in creating an ambient light setting.

To remove an ambient light setting:

1. Open the Monitors and Sound Control Panel and click the Color button.

2. Open the Ambient Light pop-up menu and choose the custom ambient light setting that you want to remove.

3. Then open the Ambient Light pop-up menu again, and choose the Delete command at the bottom of the menu. (The Delete command should include the custom ambient light setting you selected.)

AppleShare IP 6.1.1 Web & File Update: ATTO SCSI Card Issue

After installing the AppleShare IP 6.1.1 Web & File Update, the Web and File Server no longer starts up. We upgraded another server, and it did not have any problems. The only difference is that the one that will not start up has an ATTO SCSI card. Have you heard of this?

This article has been archived and is no longer updated by Apple.

ATTO has investigated this issue and has made an update to their firmware to resolve this issue for their ExpressPCI-PSC, DC, UL2S, and UL2D SCSI card models. Make sure you are running firmware v.1.3.4 or later available from the Atto Web site at **http://www.attotech.com**.

Published Date: Feb 20, 2012

Spanning Tree Protocol: AppleTalk and NetInfo Issues

When the Spanning Tree Protocol is enabled on an Ethernet bridge or switch port to which a Macintosh computer is directly connected the computer may be unable to use AppleTalk or NetInfo services.

Appletalk issues observed range from no AppleTalk services, local (to this specific network) AppleTalk services, degraded performance, and intermittent network services.

If the Spanning Tree protocol is enabled on the port to which a Macintosh computer is connected packets necessary for AppleTalk address assignment and network discovery can be dropped by the switch. This causes the Macintosh to acquire invalid or incomplete network information resulting in the behavior discussed above.
This article has been archived and is no longer updated by Apple.
I. Information on NetInfo
II. Information on AppleTalk and spanning tree

I. Spanning tree and NetInfo

Due to the time that may elapse between the network becoming active in Mac OS X and NetInfo becoming active, it is possible that spanning tree may block NetInfo requests when attempting to bind to a parent NetInfo server. Enabling "port fast" on the switch, or its equivalent, resolves this issue.

II. AppleTalk and spanning tree

Symptoms

The observed symptoms vary depending on several environmental factors. Differences in network topology, as well as differences in AppleTalk related values stored in system preference files can change the symptoms. Depending on your environment you may see one or more of the following symptoms.

Environment One

- AppleTalk routing is enabled on the network to which the computer is connected.
- The network number stored in the system preferences is not within the AppleTalk reserved start up range.
- The network number stored in the system preferences doesn't match the current network number assigned to the cable.

This would be a typical situation when moving a computer from one AppleTalk network to another.

The symptoms you would observe are:

1. Soon after the Finder loads an alert box with this message appears:

"Access to your AppleTalk network has been interrupted. To re-establish your connection, open and close the AppleTalk control panel."

2. Upon opening the AppleTalk control panel an alert box with this message appears:

"Your network number is no longer valid. It will be updated when the control panel is closed."

As requested, open and close the AppleTalk control panel to update the saved the configuration information. By doing this you store the correct network number (for this network) into the AppleTalk preferences file and into PRAM.

3. A few seconds later an alert box with this message appears again:

"Access to your AppleTalk network has been interrupted. To re-establish your connection, open and close the AppleTalk control panel"

Open the Chooser, no zones are displayed in the zone list. If you select a service (for example, AppleShare Servers) you may see devices that are physically located on the same network, but devices located on other networks are not visible. The reason for this behavior is that by attempting to update the information (node, net, zone, and so forth) associated with the interface (by opening and closing the AppleTalk control panel) the Ethernet driver was reloaded. Reloading the Ethernet driver causes the link signal to drop thus causing the Spanning Tree Protocol to restart the convergence process.

Environment Two

- AppleTalk routing is enabled on the network to which the computer is connected.
- The network number stored in the system preferences is within the AppleTalk reserved start up range.
- The network number stored in the system preferences doesn't match the current network number assigned to the cable.

This would be a typical situation when installing a new computer or after resetting a computer's PRAM.

The symptoms you would observe are:

1. Soon after the Finder loads an alert box with this message appears:

"Your AppleTalk network has become available. To use the network, open the AppleTalk control panel, then close it."

2. Upon opening the AppleTalk control panel an alert box with this message appears:

"Your network number is no longer valid. It will be updated when the control panel is closed."

As requested, open and close the AppleTalk control panel to update the saved the configuration information. By doing this you store the correct network number (for this network) into the AppleTalk preferences file and into PRAM.

3. A few seconds later an alert box with this message appears again:

"Your AppleTalk network has become available. To use the network, open the AppleTalk control panel, then close it. "

Open the Chooser, no zones are displayed in the zone list. If you select a service (for example AppleShare Servers) you may see devices that are physically located on the same network, but devices located on other networks are not visible. The reason for this behavior is that by attempting to update the information (node, net, zone, and so forth) associated with the interface (by opening and closing the AppleTalk control panel) the Ethernet driver was reloaded. Reloading the Ethernet driver causes the link signal to drop thus causing the Spanning Tree Protocol to restart the convergence process.

Environment Three

- AppleTalk routing is enabled on the network to which the computer is connected.
- The network number stored in the system preferences matches the current network number assigned to the cable.

This would be a typical situation when the Spanning Tree Protocol is first enabled on an existing network.

The symptoms you would observe are:

1. Soon after the Finder loads an alert box with this message appears:

"Your AppleTalk network is now available."

After receiving this message opening the Chooser results in what appears to be fully enabled AppleTalk services. You can browse the network and use its services. Unfortunately you may have the same node ID as another computer connected to the network and some communications may fail as a result.

Environment Four

- AppleTalk routing is not enabled on the network to which the computer is connected (a non-routed environment).

If your Macintosh is connected to a non-routed network the following symptoms appear:

1. In this environment the Mac OS displays no alerts. From the perspective of the computer everything is fine. All phases of the startup process completed successfully with no apparent difficulties. Unfortunately, there may still be difficulties.

2. One of the processes that occur during the startup process (if you have AppleTalk turned on) is that the computer attempts to acquire a unique AppleTalk node ID. Unfortunately, with Spanning Tree enabled the switch may drop critical packets necessary for the Macintosh to discover if the node ID it has selected is in use by another system. If multiple computers acquire the same AppleTalk node ID you can expect to see difficulties related to both performance and loss of services.

Note: TCP/IP based services are not affected.

Solution

Disable Spanning Tree

Spanning Tree can usually be selectively disabled on the switch ports to which Macintosh computers using dynamic address allocation are connected. In general, there is no benefit to having Spanning Tree enabled for a port to which there is a single workstation attached. To create a loop in such an environment, the user would need to have access to an Ethernet hub with two uplink ports, or two cross-over cables, as well as access to two switch ports.

Enable Fast Convergence

Several switch manufacturers have extended the Spanning Tree Protocol to allow the convergence time to be reduced. One of the enhancements usually available is the ability to safely and quickly move the port from the blocked state (listening and learning) to the forwarding state. For example, if the bridge detects a single device attached to a port it can quickly assume that no other bridges are attached to that port and move the port to the forwarding state almost immediately. Check the manufacturer's documentation for specific information on how to configure this option for your switch. For example, Cisco has an option called "portfast" that can be enabled on most of their switches. For additional information on this feature, see: http://www.cisco.com/warp/public/473/12.html

Tune the Forward Delay Timer

The Forward Delay timer can be tuned down to the minimum value. This value can usually be tuned down to a few seconds, which would give the switch enough time to move to the forwarding state before the address allocation packets were sent by the computer. If you choose to use this solution you must set these timers in the root bridge. The root bridge is the bridge that transmits these timer settings to all other designated bridges. Although you can set these timers on any bridge only the root bridge can effect the overall environment.

Spanning Tree Background

With the rapid deployment of layer 2 switches the use of the Spanning Tree Protocol has become common. Spanning Tree was originally developed for use with Ethernet bridges but has also been used in switches, since they themselves are layer 2 bridging devices. The Spanning Tree Protocol is an IEEE standard adopted in 1990 (IEEE 802.1D). Spanning Tree is a protocol designed to allow network designers to use layer 2 devices to create a loop free meshed topology. Loops in a layer 2 network can create packet storms, crippling a network and destroying network performance.

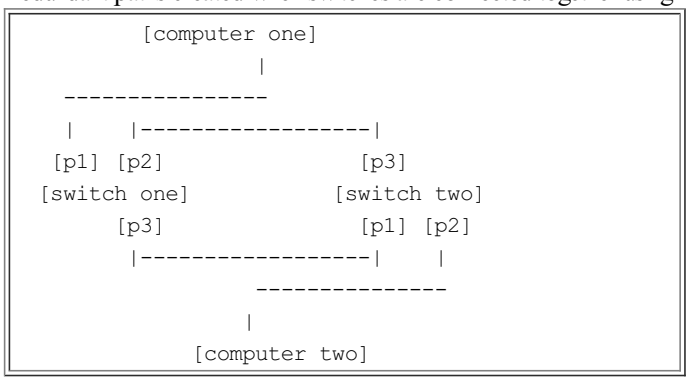
Basic Bridge Operation

The basic function of a bridge is to forward a packet from a source port to a destination port. The process involved in moving that packet involves multiple steps. Upon receiving a packet the bridge first looks in its address mapping table to determine if it has a known destination port for the packet. The bridge automatically builds the addressing mapping table by parsing the source address of packets it receives. It uses this address mapping table to determine where to forward packets. If the destination address is known, the bridge forwards that packet only to its destination port. If the destination address is not known, the bridge floods that packet over all the segments with the exception of the receiving one. This process works fine as long as there are no redundant paths in the network.

Without Spanning Tree the given the topology examples described below would create serious issues.

Example one

Redundant paths created when switches are connected together using more than one connection point.



In the above example computer one and computer two have two possible paths to each other.

For example, the paths computer one can use to get to computer two are:

- switch one/p1 -> switch one/p2 -> switch two/p3 -> switch two/p2.
- switch one/p1 -> switch one/p3 -> switch two/p1 -> switch two/p2.

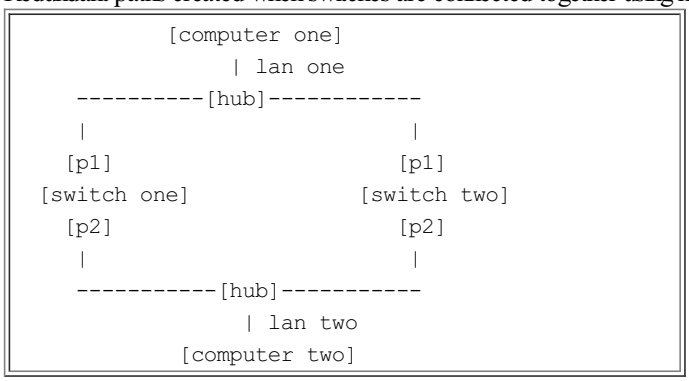
Without Spanning Tree the packets are transmitted to both switch one, and also to switch two, causing a loop.

For example, if computer one sends to computer two, but neither switch has computer two in its address table, the follow series of events occur.

- Computer one transmits a packet destined for computer two.
- Given the redundant paths both switch one and switch two see the packet from computer one.
- Switch one populates its address tables indicating that computer one is resident on port p1 of itself.
- Switch one forwards the packet to both ports p2 and p3.
- Switch two populates its address tables indicating that computer one is resident on port p3 and p1 of itself.
- Switch two forwards the packet received on port p3 to both ports p1 and p2.
- The packet (now in the second bridge hop) is forwarded back to the originating switch via p1.
- Switch one now populates its address tables indicating that computer one is resident on port p3 as well as on port p1.
- Switch one forwards the packet to both ports p1 and p2.
- The packet (now in the third bridge hop) is forwarded back to switch two via port p2.

As you can see a loop has formed that would continue forever.

Example two
Redundant paths created when switches are connected together using hubs to create paths.



Given this environment if computer one sends to system two, but neither switch has system two in its address table the follow series of events occur.

- Computer one transmits a packet destined for computer two.
- Given the redundant paths both switch one and switch two see the packet from computer one.
- Switch one populates its address tables indicating that computer one is resident on port p1 of itself.
- Switch two populates its address tables indicating that computer one is resident on port p1 of itself.
- Switch one forwards the packet to port p2.
- Switch two forwards the packet to port p2.
- Switch two populates its address tables indicating that computer one is resident on port p3 and p1 of itself.
- Switch one receives the packet from switch two on port p2.
- Switch one updates its address tables to indicate that computer one is resident on port p2 as well as port p1 of itself.
- Switch one forwards the packet to port p1 (remember it doesn't know where computer two is resident).

As you can see a loop has formed that would continue forever.

Basic Spanning Tree Operation

The purpose of Spanning Tree is to avoid and eliminate loops in the network by negotiating a loop free path. In the above examples, this means that one of the ports would need to be "disabled", or put into such a mode where it is not forwarding packets, but is still aware of the topology of the network.

The basic algorithm built-in to the protocol effectively disables the redundant links within the network. In order to determine which links to disable the switches exchange special messages, called bridge protocol data unit (BPDU) frames, that allow them to calculate a Spanning Tree and hence the active topology.

Although the Spanning Tree Algorithm is able to maintain a loop-free tree despite network changes, recalculation of the Spanning Tree is a relatively time consuming process. Standard Spanning Tree values for the maximum age of BPDUs (which is the length of time that BPDU

information is kept) is typically 20 seconds. The forwarding delay time, which is the length of time that ports are to remain in each of the listening and learning states, is 15 seconds. As a result, recalculation of the Spanning Tree following a network change takes approximately 50 seconds: 20 seconds for BPDU information to time out, 15 seconds in the listening state and another 15 seconds in the learning state.

As BPDU information is updated and/or timed-out, the Spanning Tree is recalculated and ports may transition from the blocked state to the forwarding state and vice versa. Rather than transition directly from the blocked state to the forwarding state, ports transition through two intermediate states: a listening state and a learning state. The bridge remains in each state for a preset period of time, called the forwarding delay. In the listening state, a port waits for information indicating that it should return to the blocked state. If, by the end of the forwarding delay time, no such information is received, the port transitions to the learning state. In the learning state, a port still blocks the receiving and forwarding of frames, but received frames are examined and the corresponding location information is stored. At the end of a second forwarding delay time, the port transitions from the learning state to the forwarding state, thereby allowing frames to be forwarded and received at the port.

It is very important to note that packet delivery is often delayed or fails completely as ports transition between states. That is, ports in the listening and learning states do not forward or receive frames. To the network users, these delays are perceived as service interruptions, which may present significant difficulties. In addition, certain applications, protocols (for example, AppleTalk address allocation and network discovery), or processes may time-out and shutdown during the reconfiguration process, resulting in even greater disruption to the network. Another disadvantage relates to subsequent message distribution. Following the reconfiguration process, messages are flooded across the network until the "new" destination ports are learned. Such flooding of messages can consume substantial communications and processor resources.

Tuning Spanning Tree Parameters

Changing Spanning Tree parameters, while resulting in fast convergence, may have unexpected and possibly detrimental results. Tuning Max Age down to the minimum value can result in BPDUs being discarded too early. During normal operation, the root bridge periodically transmits configuration BPDUs every hello time (usually every two seconds). These BPDUs are, in turn, propagated to bridges downstream from the root. If BPDU frames are inadvertently dropped, using a low value for Max Age may cause the bridge to trash its current configuration and recompute the Spanning Tree.

Tuning Forward Delay down to the minimum value (typically four seconds) means that when transitioning from blocking to forwarding a port spends four seconds in the listening state and four seconds in learning state. This means that there is only an eight-second window in the listening and learning states in which a BPDU indicating a loop must be received and processed. Setting this value too low may not account for the fact that BPDUs may be inadvertently dropped and can result in a loop and possibly a broadcast storm.

The information below provides descriptions of common Spanning Tree tunable parameters.

Common Spanning Tree Optimization Parameters

Parameter	Purpose
Max Age	Maximum time a BPDU received on a port is considered valid.
Forward Delay	Amount of time spent in Listening and Learning states. The total delay prior to forwarding, therefore, is FWDDELAY * 2.
Hello Time	Interval of time when the root bridge generates BPDU frames.
Bridge Priority	The settable portion of the Bridge ID. The bridge with the lowest Bridge ID is selected as the root.
Port Priority	Settable portion of the Port ID. Determines, between two equal cost paths, which one is selected to be in forwarding mode, putting the other link in blocking.

Questions and Answers

Question: Why does this only affect later Macintosh computers?
Answer: Later computers start up faster causing the packets used for AppleTalk address assignment to be sent while the port is still in the blocked state.

Question: Is Apple planning to change the way AppleTalk addresses are allocated to fix the problem?
Answer: Apple has no plans to change the algorithms used for AppleTalk address assignment.

Mac OS Runtime for Java: Applet Security

Changing Java applet security settings in Microsoft Internet Explorer has no effect when using Mac OS Runtime for Java.
This article has been archived and is no longer updated by Apple.
Microsoft Internet Explorer's applet security settings are intended for the Microsoft Java virtual machine, not Mac OS Runtime for Java (MRJ).

To change the settings for MRJ, use Apple Applet Runner which is in the Apple Applet Runner folder, in the Mac OS Runtime for Java folder, in the Apple Extras folder. Apple Applet Runner has a user interface to change the properties file which controls the global security restrictions used in MRJ. To get to the properties dialog, select "Properties" from the "File" menu in Apple Applet Runner.

Chooser: Server IP Address Button

When I click on the AppleShare icon on the left side of the Chooser window, a button called "Server IP Address" appears on the right-hand side.

Figure 1 Chooser Window

When I click on that button, it says to type in the IP address for your server. However, I get the error "No Response from the server, please try again." I know that server is running because I can see it in the Chooser. I know that the IP address is correct, because I can pull up a Web page from the Web server running on that computer. What's wrong?
This article has been archived and is no longer updated by Apple.
The most likely answer is that the server computer does not support connections of the AppleTalk Filing Protocol (AFP) using the Transmission Control Protocol (TCP). That "Server IP Address" button only looks for server computers that use AFP over TCP.

Figure 2 Server IP Address Icon

This button is NOT for connecting to servers that have a TCP/IP address and provide some other service. Examples of servers that this button DOES NOT apply to include: Web (HTTP) Servers, Printer (LPR) Servers, File Transfer Protocol (FTP) servers, Network File System (NFS) servers, Windows (SMB) servers, and AppleTalk-only servers.

Examples of servers that can use AFP over TCP include AppleShare IP 5 and later and the Apple File Services built into Mac OS X Server. Third-party AppleShare servers may support this feature. Read the server documentation or contact the server manufacturer to find out for sure.

If you connect to one of the above servers, you will see a file server icon with a globe in the lower right hand corner of that icon.

Figure 3 AppleTalk Server Icon

Figure 4 TCP Server Icon

Also, the "Where" line of the info window will show you connected via AppleTalk or TCP/IP.

Figure 5 AppleTalk Connection

Figure 6 TCP Connection

Only versions 3.7 and later of the AppleShare extension (sometimes called AppleShare client or AppleShare workstation), will display this button.

You can find the current version of the AppleShare extension at the Apple Downloads Web site at http://www.apple.com/downloads.

ASIP: How To Do A Domain Depending Multiple Domain Mail Support

This article describes how to do a domain depending multi-domain mail support in AppleShare IP.
This article has been archived and is no longer updated by Apple.
AppleShare IP (ASIP) can handle email for multiple domains as long as you don't need a specific username to go to different people. That is, user1@domain1.com and user1@domain2.com have to be the same person.

You do this by setting up entries in DNS so that other SMTP mail servers will know that your ASIP Mail server is handling all mail for the given domains. Basically, you're setting up DNS so that mail.domain1.com and mail.domain2.com point to the same server.

Given:
ASIP Mail Server's IP Address: xxx.xxx.xxx.xxx
ASIP Mail Server's domain name: mail.domain.com

Set up a DNS MX-List for:
domain1.com MX
10 mail.domain.com
100 mail.your_isp.com <---- note this line is optional

domain2.com MX
10 mail.domain.com
100 mail.your_isp.com

domain3.com MX
10 mail.domain.com
100 mail.your_isp.com

AppleShare IP Mail will handle mail for any domain with an MX-List where the ASIP Mail server is the lowest priority alternative choice in the MX-List.

AppleShare IP Print Server: Print Job Setup

I noticed when a printer is busy processing print jobs sent to it from clients, print jobs sent to the printer via an AppleShare IP Print Server do not print until all of the other jobs are completed. Why is this so?
This article has been archived and is no longer updated by Apple.
The AppleShare IP Print Server was designed so that when there are AppleTalk jobs waiting to be printed from both clients and ASIP, the clients' jobs print first.

Should you wish all AppleTalk print jobs for a printer to print on a first come, first serve basis, consider enabling the ASIP Print Server option to hide the printer. When the printer is hidden, the printer will no longer appear in the Chooser so to print to the printer, clients will select the ASIP print queue. Thereafter, all AppleTalk jobs sent to the printer will be done via ASIP Print Server and will be processed on a first come, first serve basis.

Printing via a print server may help you to be more productive because when you select to print, your jobs will be spooled to the ASIP Print Server quickly where they are stored and printed as the printer becomes available; meanwhile you can use your computer to tackle other tasks instead of waiting for your documents to print.

Another ASIP feature which also helps reduce the wait time for printing is to create a print queue with multiple printers attached to it, so several documents in the queue can print at the same time on different printers.

Macintosh: About Hot Plugging ADB Devices

It is not safe to swap different ADB devices such as the mouse and keyboard when your Macintosh computer is turned on.
This article has been archived and is no longer updated by Apple.
Swapping ADB devices (unplugging a device cable and replacing with another device cable) while the computer is on is commonly known as "hot swapping" or "hot plugging" and is not a recommended practice. Doing so may, at the very least, cause erratic behavior such as sluggish or slow performance of the device in question. For instance, mouse movement of the screen pointer may be so slow that it is effectively unusable.

At the worst, hot swapping could damage the ADB controller chip on the logic board. The same would hold true for connecting video or SCSI cables while the computer is turned on. Unless the cable technology is specifically designed for hot swapping, such as USB or FireWire, you should not hot plug cables.

Restarting the computer will usually resolve performance issues with an ADB device that has accidentally been hot swapped.

Note: Such damage constitutes customer abuse and may not be covered under warranty.

AppleWorks: ‘Disk is Full‘ Error When Saving to Windows Server

When saving certain AppleWorks 5 documents to a network server volume via Windows File Sharing (NT Server, AppleShare IP), I get the following message:

"Alert: The disk is full"

There is plenty of free space on the server. Also, if the file already exists, it can no longer be opened. If the file doesn't already exist, it is not created.
This article has been archived and is no longer updated by Apple.
Apple has identified that this may occur when saving files 1 MB or larger in size to network volumes in certain circumstances. The problem does not occur when saving files less than 1 MB in size, nor does it occur when saving files 1 MB or larger in size to a local drive.

Workaround:

You can avoid this situation by using the "Map Network Drive" feature to assign a drive letter to the network volume. To do this, follow these steps:

1. Open Network Neighborhood
2. Double-click the server
3. Right-click on the server volume you wish to map to a drive letter
4. Select "Map Network Drive"
5. Select a drive letter or use the default
6. Check "Reconnect at logon" if you wish to make this setting persistent across restarts - Click OK

Alternatively, you can save to your local hard drive and copy the file to the server volume.

AppleWorks 5: Create Label Assistant does not use metric measurements

This article explains that the Create Label Assistant in AppleWorks 5 uses only inch measurements, not metric.
This article has been archived and is no longer updated by Apple.
The option to change units of measurement for a document is under the Rulers selection of the Format menu. If you have selected Centimeters as the units of measurement for a document, AppleWorks will convert measurements entered in Inches, Picas, etc. into their Centimeter equivalents. This type of conversion takes place in areas including Format Document, Column Height in Spreadsheets, and Object Size in Drawing documents.

However, the Create Labels Assistant does not convert values. If a value of '1.0 cm' is entered, it will be interpreted as '1.0 in'. The same is true if the document's rulers are set to Millimeters, Picas, or Points.

This behavior can be seen in the Windows and Macintosh versions of ClarisWorks/AppleWorks 5. A workaround is to use the Calculator under the Apple Menu to convert from your intended custom size to Inches, using the chart below:

Intended unit of measure	Divide by
Centimeters	2.54
Millimeters	25.4
Picas	6
Points	72

Mac OS X: Logging on Local & Network NetInfo accounts with the same user name.

My computer is part of a network wide NetInfo database, and I have a network NetInfo user account setup for me. I created a local user account with the same user name as the network user. I gave them different passwords so I could login to both, but when I login with the network Netinfo password the login window shakes back and forth. What is wrong?
This article has been archived and is no longer updated by Apple.
When you log in to Mac OS X Server, the computer will first run a check against the user names in the local NetInfo database, regardless of the presence of that name in an external NetInfo server database. If it finds the user name in the local NetInfo database, it will stop.

The computer will then check the password entered against the password it has stored for the local user. If you try to use a different password that has been setup for the network NetInfo account, it will fail.

To work around this, create a local user account with a different user name. For example:

Network NetInfo entry:
Username: bob Password: sled

Local Netinfo Entry:
Username: localbob Password: sled

AppleWorks: Locked File Error When Installing

When iMac customers attempt to reinstall AppleWorks while started up from the iMac Software Install CD, the installation proceeds until the AppleWorks Help Files are written, at which point they get an error that states that the disk is locked. The installation quits at this point.
This article has been archived and is no longer updated by Apple.
Even though the Macintosh HD hard disk is selected as the destination disk, the AppleWorks installer attempts to write files to the currently active System Folder. When started up from the CD, this folder is locked. Running the installer while started up from the hard disk resolves this issue.

Apple Remote Access: Error "-7117" was Detected

This article explains how to change the protocol Apple Remote Access uses when the error message "Connection attempt failed: Error "-7117" was detected" appears on your screen.

This article has been archived and is no longer updated by Apple.

Symptom

When connecting to the Internet using Apple Remote Access, the computer may appear to stop responding (hang, freeze). If you watch the status in the Remote Access control panel, you notice that the connection attempt hangs while determining protocol. See Figures 1 and 2.

Figure 1 Status Screen

If allowed to continue, an error message appears on the screen:

Figure 2 Error Message

Products affected

- Apple Remote Access

Solution

You must change the protocol that Apple Remote Access uses, as described below.

Click the Options button (Figure 3); the Options window appears.

Figure 3 Options Button

Next, click the Protocol tab; the Protocol pane appears within the Options window (see Figure 4). If you are receiving this error, the selection "Use protocol" is most likely set to Automatic.

Figure 4 Options Window - Protocol Pane

Change the Use protocol pop-up menu to match the protocol offered by the remote server. For standard Internet connections, the correct setting is PPP (see Figure 5). If you are connecting to an Apple Remote Access server, use ARAP.

Figure 5: Selecting the PPP Protocol

Click OK. The new settings take effect immediately. You will be asked to save the changes when the Remote Access control panel is closed.

Mac OS X Server: Apple File Services and long passwords

When I set up my root (Administrator) password or another administrative user's password in OS X setup assistant, I put in long passwords as I would in Unix. However, when I go to log onto the Apple File Services on the OS X server via the Chooser I can not put in my whole password, the computer beeps and gives me the message "You have entered more characters than the maximum number allowed".

This article has been archived and is no longer updated by Apple.

Type in the first 8 characters of the root or another administrative user password, and connect, this should let you log into the server. The Chooser will only allow you to type in 8 characters. This, however is not a problem since Unix based Operating Systems generally only use the first 8 characters of a password even though you are allowed to use longer passwords.

AppleShare IP: Setting Privileges for Multiple Groups

How do I add privileges to more than one user/group when sharing a folder? I want one group to have read and write access to a folder, but I want another group to have just read access.
This article has been archived and is no longer updated by Apple.
Except where noted below, information in this article applies to both an AppleShare File Server and to Personal File Sharing.

The server administrator can define three different levels of access: Owner, User/Group, and Everyone. The Owner and User/Group fields can each define privileges for one user or for one group. While there is no way to add privileges for more than these three classes of users, it is still possible to achieve the desired results.

Example: You have a folder named "Documents" on your server. You want the "CopyWriters" group to have full read and write access to that folder, but you want the "ProofReaders" group to have read-only access to the folder.

Solution 1
Set the privileges for the shared folder as follows:

OWNER: CopyWriters: Read/Write
USER/GROUP: ProofReaders: Read Only
EVERYONE: None

For Personal File Sharing, this is located under "Sharing" in the "Get Info" window. For AppleShare, this is located in the Web & File Admin under "Show Disks & SharePoints".

The drawback to this scheme is that if a user in the CopyWriters group creates a new folder, that folder will be owned by that individual user (not the CopyWriters group). This means that user must manually change the privileges to allow other members of the CopyWriters group to access the folder. Until that happens, members of the CopyWriters group will see a locked folder.

Note: AppleShare 6.2 comes with the AppleShare IP Advanced Setup utility. This contains an option to "Make New Folders Inherit Their Privileges." By checking this box, the owner of a newly created folder will be the same as the enclosing folder. (In this example, the CopyWriters group is the owner of the new folder.)

Another thing to be aware of when assigning ownership to a group is that any member of the group will be able to change privileges to the folders which that group owns. This includes changing ownership so that nobody else can access the folder.

For a concrete example of how this principle is applied to a complex sharing setup, see the following article:

Article 12476: "**AppleShare 3.0.x: Set Up For Large Group Possibilities**"

Solution 2
OWNER: Administrator: Read/Write
USER/GROUP: CopyWriters: Read/Write
EVERYONE: Read Only

This solves the issue above of new folders locking out members of the CopyWriters group. The drawback is that everyone will be able to at least read files in this folder. Any user that can see this folder (including guests, if they are allowed) will have read-only access to the Documents folder.

You can address this by putting the Documents folder inside another folder that only members of CopyWriters and ProofReaders can access. That way, you can be sure that privileges granted to EVERYONE will only apply to members of the ProofReaders group.

AppleShare IP: Basic SMB Client Troubleshooting

Listed below are some basic steps for troubleshooting difficulties in connecting to an AppleShare IP SMB server.
This article has been archived and is no longer updated by Apple.
If you are having any difficulties establishing, maintaining, or using an SMB connection to an AppleShare IP server, but there are no issues when using other protocols, try the following troubleshooting steps.

1) Update to the latest version of ASIP.

2) Map the server volume as a Network Drive on the Windows clients. To do this, follow these steps:
- Open Network Neighborhood
- Double-click the server
- Right-click on the server volume you wish to map to a drive letter
- Select "Map Network Drive"
- Select a drive letter or use the default
- Check "Reconnect at logon" if you wish to make this setting persistent across restarts - Click OK

Published Date: Feb 20, 2012

Mac OS X Server: Changing Apache HostnameLookups Value

Changing the HostnameLookups value in Apache from the default of "no" can cause performance problems and make your server vulnerable to Denial of Service attacks.

This article has been archived and is no longer updated by Apple.

The Apache "HostnameLookups" property allows Apache enter the actual hostname (vs. just the IP address) address into its logs. You should NOT change it from the default value of "No." Enabling HostnameLookups can seriously degrade your servers' performance and increase your risk of DenialOfService attacks.

Should it become necessary to resolve an IP address to a DNS name, the utility "logresolve" (located in the /usr/sbin directory) can be used to obtain this information.

To use logresolve:

1. Launch the logresolve utility.
2. Enter the IP address in question into the terminal window.
3. Press the return key.
4. The DNS name of that IP address displays in the terminal window.

Published Date: Feb 20, 2012

Mac OS X: The BSD "find" Command

The BSD "find" Command Searches UFS, HFS, and HFS Extended Volumes.
This article has been archived and is no longer updated by Apple.
Note: This information is valid for all versions of Mac OS X and Mac OS X Server.

The BSD "find" command implemented in Mac OS X Server will search Macintosh HFS and Macintosh HFS Extended volumes. Because volumes with these format types are auto-mounted in the root file system, searching the root volume "/" will locate files on any mounted local volume.

Thus, to locate a file typically found on an HFS Extended volume on a server that has netboot clients, enter:

```
find / -name "Mac NC #" -print &
```

This should return all occurrences of files or directories on "/" whose names include the string specified in quotes, and print it to standard io (the screen). The ampersand "&" specifies to do this in the background.

Note: In this example, the search string is in quotes; these quotes are necessary because of the space characters included in the string. Searching for a name that is all one word with no illegal characters, such as "hostconfig", does not require quotes. As in traditional BSD unix, the backslash character, "\\", may be used before an illegal character to cause it to be parsed as part of the search string:

```
find / -name Mac\\ NC\\ # -print &
```

You can also use the "locate" command, which is easy to use and faster than find. Simply type "locate" followed by the name or part of a name of files you are looking for and press Return. You should get a list displaying the paths to those files. The locate command searches a database of files on the drive, which can get out of date. If you are searching for a file that you know exists but is not found, you can run the 'weekly' script manually to update this database. To do so type the following command:

```
sudo sh /etc/weekly
```

Press Return, enter your password, and the weekly script will run and update your locate database.

Execute "man find" or "man locate" at the command line to get more information on using these commands.

PowerBook G3 Series: DVD-Video Kit Installation

This article explains the correct procedure to follow when installing the Macintosh PowerBook DVD-Video Kit (M7164LL/B) or the DVD-Video PC Card (special order only-M6664LL/B) for the PowerBook G3 Series computers, with Apple DVD Software version 1.1 (including the necessary extensions required for the DVD hardware and software to function properly).
This article has been archived and is no longer updated by Apple.
Install the Apple DVD Player Software by clicking on the 'Install Apple DVD Software' icon within the Apple DVD Software CD folder (currently at version 1.1). To determine whether or not the Apple DVD Player Software has been preinstalled on the PowerBook, check to see if the Apple DVD Player alias is in the Apple Menu.

The installation of this software will create the Apple DVD Software 1.1 extension package, which includes the following extensions:

- Apple CD/DVD Driver (1.2) This extension enables the use of CD and DVD Discs. This driver replaces the Apple CD-ROM and Apple DVD-ROM driver, which are no longer necessary.
- ATI Driver Update (1.4.7) This extension updates the display driver for ATI hardware on the PowerBook.
- ATI MPP Manager (1.1.1) This extension enables the host CPU to communicate with the DVD-Video PC Card. It also manages the transfer of video stream data from the DVD-Video PC Card to the graphics chip on the PowerBook.
- Audio Tune Up (2.1) This extension updates the audio drivers on the PowerBook.
- DVD Decoder Library (1.1) This is the Decoder Library extension required to properly decode DVD discs.
- DVD PC Card Enabler (1.1) This is the PC Card Enabler extension for the DVD-Video PC Card.
- DVD Region Manager (1.0) This is the Region Manager extension for controlling region access with DVD discs.
- UDF Volume Access (1.2) This extension enables the PowerBook to read disks that are recorded in the Universal Disk Format?, which is the standard format for DVD discs. Please note that this extension supports volumes recorded at the Optical Storage Technology Association UDF m1.5 specification level.

All of these extensions must be installed and turned on for the DVD hardware and software to function normally. After the install is complete, restart the computer. Once at the desktop, insert the DVD-Video PC card. After the PC Card appears on the desktop, insert a DVD disc and run the Apple DVD Player application (an alias for this application is located in the root directory of the Apple Menu).

New enhancements to the player in version 1.1 include support to play movies designated for any one DVD-Video Region you choose, the ability to play DVD-Videos discs that use the PAL video standard, and the ability to pick up viewing right where you left off in a movie. This last feature will function even when you shut down your system, but you must not eject the disc.

For ideal DVD playback, disable Virtual Memory and set the Energy Saver control panel to maximum performance.

For best results when setting up the PowerBook to show DVD-Video on a television, set the resolution to 720x480 NTSC or 720x576 PAL from the Control Strip.

The latest version of the Apple DVD Player software is available for download from the Apple Software Updates Web site at **http://www.apple.com/swupdates**.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Mac OS X Server: Workspace Manager Menus Disappear

In Mac OS X Server's Workspace Manager I have noticed that after quitting an application, all of the menus disappear except for the upper right-most process menu. How can I make the menus reappear?

This article has been archived and is no longer updated by Apple.

Simply clicking on an element within the Workspace Manager (such as the desktop or a window) will return the menus to their normal state.

Published Date: Feb 20, 2012

Apple DVD Player: Conflict If Servers Mounted at Startup

This article describes an issue with Apple DVD Player that can arise when servers are set to automatically mount using the Chooser.

Note: This issue has been addressed in Mac OS 9.
This article has been archived and is no longer updated by Apple.
If you use the Chooser to automatically mount servers at system startup time (using the checkbox next to the volume name), Apple DVD Player may not work after the next restart. Instead, you receive the error:

"Apple DVD Player cannot open because the Apple CD/DVD extension is not installed or the DVD-ROM module could not be found. Open the Extensions Manager control panel and make sure the Apple CD/DVD extension is installed and enabled. You may have to reinstall Apple DVD Player. If you are using a PowerBook, make sure your DVD-ROM module is properly installed. (217)"

This only happens with servers that require a name and a password.

When this feature is used, a dialog is displayed early in the startup process which prompts you to enter your name and password for access to the server. However, this dialog keeps the CD/DVD driver from registering itself properly and makes the Apple DVD Player application think that DVD hardware cannot be found.

To resolve the issue, open the Chooser and navigate to the server that is currently set to mount at startup. Turn off that feature by unchecking the checkbox next to the volume name in the Chooser. If you are currently unable to connect to the server(s) to uncheck this option, remove the AppleShare Prep file from the Preferences folder instead.

To achieve the same behavior without creating the conflict with Apple DVD Player, drop an alias to the server in your Startup Items folder.

Note: This issue has been addressed in Mac OS 9.

Power Macintosh G3 (Blue and White): Video Mirroring

This article describes how to setup the Power Macintosh G3 (Blue and White) Teacher Bundle for video mirroring.
This article has been archived and is no longer updated by Apple.
This topic is discussed in detail in the ATI Xclaim VR Manual.pdf, pp. 30-35.

Anything you display on your monitor can be output to your TV or your VCR. To do this, proceed with the following steps:

1. Turn off your computer and TV or VCR.

2. Connect the video-out adapter that came with your computer (it is a Y-cable with a plug on one end, and two sockets on the other end) to the TV-out port on your ATI Xclaim VR card.

3. Determine if your TV or VCR has an S-video or composite (RCA) video input. Attach the appropriate cable to the appropriate socket on the video-out adapter.

Notes:

- If your TV or VCR has both S-video and composite connectors on it, you only need to use one of them. S-video will generally produce the highest quality image.

- You can connect two TVs or VCRs to your computer at the same time, one using S-video and the other composite (RCA) video, connected to the appropriate sockets on the video-out adapter cable. Both devices will display (or record) the same image simultaneously.

4. Turn on your computer and TV or VCR.

You can now either display video on the attached monitor and the TV or VCR (simulscan), or strictly to the TV or VCR. There are several ways to accomplish this.

Using the Monitors and Sound control panel:

1. From the Apple menu, go to Control Panels, and open Monitors and Sound.
2. Choose the resolution at which you wish your image to be displayed. Depending on the model of monitor you have attached to your computer, you may have some choices for Simulscan. If you choose one of these resolutions, the image will be displayed on the monitor and on the device (TV or VCR) attached to the video-out adapter.

Figure 1 Monitor and Sound Control Panel

3. You should get a dialog box alerting you: "The setting for your monitor has been changed. Click OK to confirm that the monitor is displayed correctly, or click Cancel to revert to the previous setting." If you do not make a choice, it will automatically revert to the previous setting.

Using the Control Strip:

1. From the Resolution Control Strip module, choose the resolution at which you wish your image to be displayed. Depending on the model of monitor you have attached to your computer, you may have some choices for Simulscan. If you choose one of these resolutions, the image will be displayed on the monitor and on the device (TV or VCR) attached to the video-out adapter.

Figure 2 Resolution Control Strip Module

2. You should get a dialog box alerting you: "The setting for your monitor has been changed. Click OK to confirm that the monitor is displayed correctly, or click Cancel to revert to the previous setting." If you do not make a choice, it will automatically revert to the previous setting.

Using the ATI Displays control panel:

1. From the ATI menu in the Control Strip, or from the Control Panels folder (accessible under the Apple menu), open ATI Displays.

2. Click on the Mac2TV hot spot on the control panel.

Figure 3 ATI Displays

3. A detailed settings window will appear, wherein you can specify your video preferences. For more information about this window and how to optimize your TV display, please refer to your ATI Xclaim VR Manual.pdf.

4. One you select your settings and turn Video Output on, you should receive an alert that Mac2TV is about to turn on and it will dim your monitor display. Simulscan is not an option in Mac2TV.

AppleWorks 5: Font Menu Settings not Retained

In AppleWorks 5 for Windows, the font menu settings are reset when the program is reopened.
This article has been archived and is no longer updated by Apple.
The Windows versions of AppleWorks 5 and ClarisWorks show 22 fonts in the Font Menu. The default set of fonts is changeable in a session by choosing 'Other' at the bottom of the Font Menu.

To make fonts appear or disappear from the Font Menu choose Other at the bottom of the Font Menu. Select fonts you want to appear in the Font Menu, and deselect fonts you want removed from the menu. This does not remove the fonts from your computer. When the AppleWorks program quits and reopens the Font Menu resets to the default set.

Also, AppleWorks for Windows offers an option for setting the Default Font, which determines the font AppleWorks uses for new word processing documents. The fonts it offers match the fonts offered in the Font Menu. Like the Font Menu, the Default Font preference change to the 22 default fonts when the program quits and reopens.

AppleWorks: Excel Spreadsheets Translate as Empty

Translating a document using the XTND Translator for Microsoft Excel 3.0 or Microsoft Excel 4.0 may display an empty spreadsheet. This result is expected if the Excel document was protected with Excel's sheet or workbook protection.
This article has been archived and is no longer updated by Apple.
In order to display the content of an Excel sheet or workbook, it must not be protected with a password when it is opened by AppleWorks.

If an Excel spreadsheet document is protected with a password and then opened with AppleWorks, it displays as an empty spreadsheet. To make the data appear, the spreadsheet must be saved from Excel with the workbook and sheet protection disabled.

Explanations of steps to turn Excel's protection on and off, is offered by Microsoft.

ClarisWorks 5.0: Installs Older Version of Symbol Font

This article describes a minor issue with the installer for ClarisWorks 5.0, when installing on machines using Mac OS 8.5 or newer.
This article has been archived and is no longer updated by Apple.
Starting with Mac OS 8.5, the included Apple fonts were updated to include the European currency symbol, called the "euro.".

When installing ClarisWorks 5.0 on Mac OS 8.5 and later, the installer replaces the Symbol font with an older version. This older version does not include the euro symbol. Other fonts are not affected.

The AppleWorks 5.0.3 installer does not install an older version of the Symbol font.

To resolve this issue, you can do a Customized Install of the Symbol font from the Mac OS Install application to update to the newer font.

As a workaround, use another Apple-installed font that supports the euro symbol, such as Helvetica or Times.

For information regarding the euro currency symbol and which Apple fonts support it, see:
Tech Info Library Article 22222: "**Mac OS: The Euro Currency Symbol**"
Published Date: Feb 20, 2012

Open Transport 2.0.3: TCP/IP "Load only when needed" Behavior

After having installed Mac OS 8.6 I've noticed that my TCP/IP stack remains loaded when physically connected through Ethernet despite the fact that no applications or other services seem to be currently utilizing TCP/IP.
This article has been archived and is no longer updated by Apple.
The "Load only when needed" checkbox available through the Options button in the TCP/IP control panel no longer unloads the TCP/IP stack after two minutes of inactivity when physically connected through ARP-able media such as Ethernet. This change was introduced in Mac OS 8.6. Versions of Open Transport prior to 2.0.3 unload the TCP/IP stack two minutes after the last endpoint was closed. Open Transport 2.0.3 and later continue to respect the configured setting in the sense that the TCP/IP stack will not load until an endpoint is opened if the "Load only when needed" option is enabled. Point to Point Protocol (PPP) or Serial Line Internet Protocol (SLIP) sessions made through a serial connection will continue to respect the settings as configured in the TCP/IP control panel. The stack will unload for PPP and SLIP connections that are torn down.

Note: System extensions, such as the Time Synchronizer extension, can load the TCP/IP stack at startup and will not unload so the TCP/IP stack will remain active as the endpoint is never closed.

TCP/IP Options: What does "Don‘t retain DHCP lease on Shutdown" do?

This article explains the effect of the "Don't retain DHCP lease on Shutdown" checkbox in the TCP/IP Options control panel, and explains why users may want to use it.
This article has been archived and is no longer updated by Apple.
Note: A detailed technical explanation the DHCP client, including this option, may be found in Knowledge Base article 58372: "**Open Transport: DHCP Client Behavior**"

By default, if a Mac running Mac OS 8.6 is shut down (or put to sleep, in the case of PowerBooks), it does not let the DHCP server know that it no longer needs the assigned IP address. Then, if the computer is booted (or a PowerBook is woken from sleep) before the lease expires, it will remember the last IP address and request to use it again.

One effect of this is that leases may be left dangling - meaning that even though the original client is not using the IP address, the server cannot give it out to another client which needs it since it wasn't explicitly released. Normally this is not a problem and the administrator can configure the DHCP server for an appropriate lease time.

By checking the box for "Don't retain DHCP lease on Shutdown" you are telling the client Macintosh to always release the IP address when the Mac is either shutdown or restarted. Then on next startup, the Mac will configure DHCP as if it were starting up for the first time. This may result in the Mac receiving a different IP address from the server.

There are a couple of situations where this may be preferable:

1. If there is an extreme shortage of IP addresses for the network and administrators want them released the instant they are not being used.

2. For computers that frequently move from one physical network to another. This is particularly relevant to PowerBooks. This way, you can be sure that (a) the IP address is released when the computer is no longer on the network and there is no chance the client will need it again, and (b) when the PowerBook boots or wakes up, it won't assume that it is on the same network it was on when it was shut down or put to sleep.

The default DHCP behavior for Mac OS 8.6 should provide optimum performance for most situations. Unless you are encountering one of the specific situations mentioned above, or unless you are specifically directed to do so by your network administrator, Apple recommends that you not alter the default 8.6 behavior by checking this box.

Note: There is currently an issue with the TCP/IP Options control panel that will not allow you do de-select this option once it is turned on. For a full description and work-around, refer to Knowledge Base article 58375: "**TCP/IP Options: Can't Turn Off "Don't Retain DHCP lease**"

If you have a CD with Mac OS 8.6 on it, the TCP/IP Options control panel may be found in the Network Extras folder. Otherwise, it is included in Open Transport Extras 2.0.3, available available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.

QuickTime Streaming Server: General Information

Streaming is a service that sends live and stored multimedia over a network at a rate that lets a client computer play the media in real time. QuickTime Streaming Server streams QuickTime-compatible media to client applications that support QuickTime, including a Web browser with the QuickTime plug-in.
This article has been archived and is no longer updated by Apple.
You can use QuickTime Streaming Server to:

- Stream low-bandwidth and high-bandwidth multimedia (up to 1.5 megabytes per second)
- Reflect live broadcast streams, either unicast or multicast streams.
- Manage the number of concurrent connections to the streaming server and the maximum throughput per connection.
- Log server usage.
- Monitor server activity.

You can install QuickTime Streaming Server when you install Mac OS X Server release 1.1, or you can install it later. To install it later, use the Mac OS X Server installer and be sure to check the option to install QuickTime Streaming Server.

QuickTime Streaming Server software includes:

- QuickTime Streaming Server, installed in the /usr/sbin/QuickTimeStreamingServer directory.
- QuickTimeStreamingServerAdmin.app, installed in the /System/Administration/ directory.
- A sample multimedia file, installed in the /Local/Library/QuickTimeStreaming/Movies/ directory.
- A configuration file, installed in the /etc/ directory.

Protocols Used for Streaming:
QuickTime Streaming Server uses standard Internet protocols: Real-Time Protocol (RTP), Real-Time Streaming Protocol (RTSP), and Session Description Protocol (SDP). RTP sends data from the server to a client computer. RTSP controls the server from the client computer. It allows a stream to be started and stopped, much the way a VCR can be started and stopped. SDP is used to reflect a multicast.

For information on the files you can stream, see the section "File Formats and Compression Methods Compatible for Streaming."

Server Configuration:
Your server must have the following:

- An Ethernet connection set up already
- Enough hard disk space to store the multimedia you want to stream
- For best performance, three or more Wide Ultra SCSI hard disk drives are recommended.

Managing QuickTime Streaming Services:
You use QuickTimeStreamingAdmin.app to start or stop streaming services, to manage streaming traffic, and to monitor streaming activity. To open QuickTime Streaming Server Administration, choose QuickTime Streaming Admin from the Apple menu.

Starting or Stopping Streaming Services
To start streaming services, open Quick Time Streaming Server Administration and click Start Server in the Settings panel.

To stop streaming services, click Stop Server. If there are active connections to the streaming server, you see a message. You can choose to stop streaming immediately or wait until there aren't any active connections. If you choose to wait until there aren't any active connections, then no new connections will be established.

If streaming service does not start up:

1. Check the error log file for error messages.
2. Check to be sure QuickTime Streaming Server is in the usr/sbin/QuickTimeStreamingServer directory. The file isn't visible unless you look for it from Terminal.app. If it is not there, you need to reinstall QuickTime Streaming Server. (Terminal.app in located the /System/Administration directory.)

Making Multimedia Available for Streaming:
When QuickTime Streaming Server is installed, a folder named Movies is created automatically in the /Local/Library/QuickTimeStreaming/ directory. Users who connect to your streaming server can stream any multimedia files located this folder.

To use a different folder for streamed media, click the folder button in the Quick Time Streaming Server Settings panel. You can choose only one folder for streaming. All items in the folder you choose are available for streaming, so be sure to check the contents of the folder before you make

it available for streaming services.

For best performance, you can put media files on two or more hard disks. But because you can use only one folder for streaming, you need to create a symbolic link from the streamed media folder to the actual location of the media files. For information on creating a symbolic link, see the man pages for the "ln" command.

Setting Up Streaming Capacity:
You use Quick Time Streaming Server Administration to limit the number of connections and to set the maximum throughput allotted for streaming services. If you use your server for other services in addition to streaming, you may want to control how much of your server's capacity is dedicated to streaming.

Monitoring Server Activity:
You can track peak periods of usage by monitoring server activity. To view server activity, choose Show Activity Monitor from the Server menu. You can change the range of each histogram by clicking the low and high range buttons.

Logging and Viewing Access History:
Access history lets you see how many times each media file has been streamed since a particular date and time. To log access history, the Log Access checkbox in the QuickTime Streaming Server Settings panel must be checked. (It is checked by default.) To view Access History, choose Show Access History from the Server menu.

If you click the Clear button in the Access History window, information in the access log is copied to another file, named by date. If you don't clear the log, then access information older than one week is cleared automatically. If you want to delete the cleared access information, drag the dated file to the Trash.

If you want more details about what's being accessed, by whom, and when, you can view the file located at /Local/Library/QuickTimeStreaming/QuickTimeStreamingAccess.log. You may need to write a utility to process the file so you can view a digest of the most important information for your site. For example, you can write a script (using Perl, cshell, or a similar scripting tool) to tally the number of times users from a particular domain connected to the streaming server during a specific time period.

Logging and Viewing Error Messages:
A log of error messages can help you troubleshoot problems with streaming services. To log errors, open Quick Time Streaming Server Administration and be sure the Log Errors box in the Settings panel has a checkmark in it. (It is checked by default.) To view the error log file, choose Show Error Log from the Server menu.

If you click the Clear button in the Error Log window, information in the error log is copied to another file, named by date. If you don't clear the log, then error information older than one week is cleared automatically. If you want to delete the cleared access information, drag the dated file to the Trash.

Troubleshooting:
You will be able to troubleshoot streaming problems more easily if error logging is turned on. See the previous section, "Logging and Viewing Error Messages."

If performance seems slow:
If you are using the computer for streaming as well as other services, you may need to limit the number of connections or the throughput available for streaming so that other services do not slow down. If you do not want to reduce the number of streaming connections or the throughput, you may need to move other services to another computer.

1. If you are using 10-BaseT Ethernet, you may need to upgrade to 100-BaseT Ethernet.
2. Put media files on two or more hard disks. But because you can use only one folder for streaming, you need to create symbolic links from the streamed media folder to the actual location of each media file. For more information see the previous section "Making Multimedia Available for Streaming."
3. You may need to expand your server by adding additional hard disks, random-access memory, or Ethernet ports.

If streaming service quits unexpectedly:

1. Check the error log file for error messages.

If multimedia files are not streamed properly, or errors occur during streaming:

1. Check the error log file for error messages.
2. Check to be sure you have enough random-access memory to support the number of connections or throughput you've set up for streaming.
3. Check to be sure you are not running out of hard-disk space.

Preparing Media for Streaming:
Any "hinted" QuickTime file can be streamed. You use an application such as MoviePlayer Pro to export media as a hinted QuickTime movie.

A hint track contains information about the media file that's needed to stream the file properly. You must use an RTP hint track with QuickTime Streaming Server; other protocols will not work. Each track in a media file must have its own hint track.

Files do not need to be self-contained. If files are not self-contained, the files that they reference must also be placed directly on the server (AppleShare aliases will not work). In addition, files must have been prepared from the same volume, and placed on the same volume. (The file name in the hinted movie must be relative to the movie, not an absolute path onto another volume.) Enclosed files can be in "foreign" formats.

Reflecting a Multicast:
To reflect a multicast, copy the Session Description Protocol (SDP) file that describes the multicast to the streaming media folder you set up previously. You must use RTSP to reflect a multicast; other protocols will not work with QuickTime Streaming Server.

When you give your users the URL for the multicast, do not include the sdp extension. For example, if the sdp file is named "greatshow.sdp," the URL you give to your users is: "rstp://yourserver.yourdomain.com/greatshow"

Note: When you export a hinted streaming movie using MoviePlayer, you have an option to create an SDP file. This SDP file is unrelated to the SDP file needed to reflect a multicast. Do not make this type of SDP file and place it in the server directory. It will not work.

File Formats and Compression Methods Compatible with Streaming:

File Formats:

Video:
QuickTime, AVI

Audio:
AIFF/AIFC, Sound Designer II, System 7 Sound, uLaw (AU), WAV

MIDI:
Karaoke MIDI, Standard MIDI

Compression-Decompression Methods (CODECs)

Preferred video compressors:

- H.263
- Motion JPEG A
- Sorenson Video
- H.261

Preferred audio compressors:

- QDesign Music codec
- QUALCOMM Pure Voice
- DVI 4:1
- ALaw 2:1
- uLaw 2:1
- 16-bit raw

Supported video compressors:

- Animation
- Cinepak
- Graphics
- Motion JPEG B
- None
- Photo JPEG
- Video

Supported audio compressors

- IMA 4:1
- MACE 3:1
- MACE 6:1

Macintosh Server G3: Multi-port Ethernet Card use under Mac OS 8.x

My Macintosh Server G3 is used in a dual boot configuration between Mac OS X Server and Mac OS 8.6. Why can't I use the Multi-port Ethernet Card under Mac OS 8.6?

This article has been archived and is no longer updated by Apple.

The Multi-port Ethernet Card is intended to be used with Mac OS X Server only. There are no drivers available for the card under Mac OS 8.x or Mac OS 9.x nor does Apple currently have plans to introduce any.

AppleWorks 5: Editing Master Page of Business Plan Stationery

AppleWorks may quit unexpectedly when you try to edit the Master Page of the Business Plan Stationery template.
This article has been archived and is no longer updated by Apple.
In AppleWorks 5 for Mac OS and Windows, editing the Master Page of the Business Plan Stationery causes the application to quit.

Other Stationery templates are not affected. To work around this issue, create a new Drawing Document or open a similar template such as the Proposal Generator, copy the objects from the Business Plan, and paste them into the new document. You can then modify the layout, and edit the Master Page of the new document.

Power Macintosh G3: Connecting to LCD Projector

This article explains how to connect the Apple Studio Display 17 to an LCD projector.
This article has been archived and is no longer updated by Apple.
The Apple Studio Display 17 was tested for use with Power Macintosh G3 systems running Mac OS 8.0 or later. It was not tested for use with other configurations such as LCD projectors. Some customers have reported that the following configuration works with some LCD projectors:

1. Connect the LCD projector directly into the Power Macintosh G3 video out connector.
2. Connect the VGA to Macintosh display adapter that shipped with the Apple Studio Display 17 (922-3769) to the Macintosh to VGA adapter (922-3764) supplied with the PowerMac G3.
3. Connect the display adapter to the VGA video out port on the LCD projector and connect the Apple Studio Display 17 cable to the paired video adapters.

Once the setup is confirmed, power on the G3, LCD projector, and the Apple Studio Display 17. Consult the LCD projector's users manual or manufacturer for determining the projection unit's supported resolutions.

German Chicago Font v3.0.1: Changes

This article lists the issues resolved by version 3.0.1 of the German Chicago Font.
This article has been archived and is no longer updated by Apple.
A fault was discovered in the German Chicago font that would cause Adobe PageMaker and Illustrator to stop operating. This new font addresses the issue. Additionally, this version of the German Chicago font also contains a slightly modified 12 point bitmap to make zero and capital letter O, and capital letter I and digit one look different. There are no other changes in this font.

Note: A drag installation of this font is not sufficient because the font must be updated in both the System file and in the Fonts folder. Therefore, use the posted installer.

The font is for the German localized OS 8.5 and 8.5.1 and 8.6 only.

The Chicago 3.0.1 font is posted on the Apple Software Updates Web site at http://www.apple.com/swupdates.

PowerBook, iBook: Using with Mobile Cellular Phones

This article discusses using PowerBook and iBook computers with mobile cellular phones.
This article has been archived and is no longer updated by Apple.
Question: Can I use the modem in my portable Apple computer to make a data/fax call through my mobile cellular phone?

Answer: Mobile phones come in two varieties, analog and digital.

Analog phones closely resemble the land line telephone network that we are most familiar with. Some mobile phones allow you to connect the phone to the internal modem of a PowerBook or iBook. Although this may work, Apple does not provide support for it.

Digital mobile phones are unable to use the internal modem in PowerBook and iBook computers because their modems are designed to be used with an analog telephone network, and not the digital network mobile phones use. Some vendors of mobile phones offer PC cards and cables that provide an interface with the mobile phone that simulates an analog modem. Check with your mobile phone vendor and mobile phone operator for options and accessories that work with your computer.

Question: The Mac OS 8.6 specifications say:

> "IrDa capabilities - Lets you check email using a compatible PowerBook and an IrDa-capable Nokia or Ericsson mobile phone (ISP required)."

How can I do this? Also, after updating my IrDA capable Macintosh to Mac OS 8.6, I noticed I have two new modem scripts, Ericsson Infrared and Nokia Infrared. What are these for?

Answer: Certain digital mobile phones, such as the Nokia 7110 and the Ericsson SH888 contain built in data communications capabilities. In order to take advantage of this feature, a serial connection between the computer and the phone must be established. One possible connection method is to use a serial cable that connects the phone to a serial port on the computer.

You can also use the IrDA port on the PowerBook and the phone to make a serial connection. Mac OS 8.6 can use the IrDA port as a serial port. In the Modem control panel, select "Infrared Port" in the Connect via pop-up menu. Select Ericsson Infrared, Nokia Infrared, or another modem script provided by the phone manufacturer. This configuration is readily available in locations where the GSM mobile phone standard is widely used. It may also work with other digital telephone standards. Check with your mobile phone system operator to determine if this feature can be used with their service.

For detailed information on the features of mobile phones, please see the Web sites for Ericsson and Nokia.

Notes:

1. iBook computers do not have an IrDA port.
2. For more information, consult the documentation for your cellular phone, or contact the phone's manufacturer.
3. While this article mentions specific phones, there may be others with similar capabilities. Always check with the phone vendor for current product availability and specifications.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

Powerbook G3 Series (Bronze Keyboard): How to Reinstall FAXstf

My Powerbook G3 Series (Bronze keyboard) came with FAXstf and I need to reinstall this software. How do I do this?
This article has been archived and is no longer updated by Apple.

Mac OS 8.6

The blue CD that came with the computer entitled "Macintosh PowerBook G3 Series" has a folder named "CD Extras." Inside the "CD Extras" folder is a folder named "FAXstf 5.0." Inside this folder is the "FAXstf Installer" that you use to reinstall the software.

If you run the Apple Software Restore program off the CD it reinstalls the FAXstf Software along with the original bundle that came with the computer.

Mac OS 9

1. Insert the Restore CD and, using Disk Copy, open the "PowerBook G3 Series HD.img" in the PowerBook G3 Restore: Configurations folder. This mounts an image of the original hard disk contents on your Finder desktop.

2. Drag the following items from the folder indicated to the respective folder on your hard disk:

Applications Folder - FAXstf 5.0 folder

System Folder:Apple Menu Items Folder - FaxStatus

System Folder:Extensions Folder - FaxPrint, FAXstf PPC Shared Library, FaxMonitor, STFInit, and STF Toolbox

System Folder - STF folder

QuickTime Streaming Server: Verifying Installation

How do I verify that QuickTime Streaming Server has been installed?
This article has been archived and is no longer updated by Apple.
To verify the released version of QTSS has been installed:
In a terminal window, the command '`QuickTimeStreamingServer -v`' should result with:

[hostname:~/updates_4.21] root# QuickTimeStreamingServer -v
QTSS/v66 Built on: Apr 16 1999 , 18:10:07
-d: Run in the foreground
-l: For each RTP stream, write a log of all timestamps & sequence
numbers
-r: Don't append any random offsets to timestamps & sequence numbers
-p XXX: Specify the default RTSP listening port of the server

To verify the location of the Movies directory:
The Movies directory contains all files that will be made available via QTSS. The location of this directory is listed in the Admin application:

- Under the Apple Menu, select Administration, then select QuickTimeStreamingServerAdmin

Place selfcontained, hinted movies in the Movies directory.

Notes:

1. QuickTime Streaming Server requires MacOSXServer patch 1 installed.

2. Settings for the QuickTimeStreamingServer are held in the NetInfo database under services/QuicktimeStreamingServer. Several of the settings can be set via the Admin app (under the Apple Menu, in Server Administration, select QuickTimeStreamingAdmin.app). Any setting can be manipulated via the NetInfoManager.app or manually using niutil (see the man pages).

For any changes to take affect, the QTSServer must be restarted.

Apple DVD Player: How to Reduce Skipping or Stuttering

Movies may occasionally skip or stutter when you watch them from a DVD-Video disc on your computer. This article can help you reduce or eliminate skipping and stuttering.
This article has been archived and is no longer updated by Apple.

Mac OS X and Mac OS 9

Outdated Software

Make sure you have installed the latest version of the Mac OS and Apple DVD Player software. You can install the latest versions using the Software Update control panel (Mac OS 9) or preference pane (Mac OS X). You should also update to the latest version of QuickTime, which can be downloaded from (http://www.apple.com/quicktime).

Other Open Applications

Some application programs periodically access the hard disk while they are open. Common examples of this are programs with an auto-save feature and email programs that check email on a regular schedule. To ensure that open applications don't interfere with movie playback, quit all open applications before watching a movie from a DVD-Video disc.

> **Note**: For Mac OS X, this includes applications open in the Classic environment. If quitting Classic applications does not help, you can stop Classic using the Classic preference pane.

Virtual Memory

In Mac OS 9, virtual memory should be turned **on** when playing DVD movies. Virtual memory can be turned on in the Memory control panel. Changes take effect after restarting. With Mac OS X, virtual memory is always on.

Color Bit Depth

Sometimes decreasing the color bit depth can directly reduce skipping. Set the colors to Thousands and then open the Apple DVD Player application. The movie plays in full color and is not affected by this setting.

Dual-Layered DVD Discs

Movies that come on dual-layered DVD-Video discs can pause up to a second when switching to the second layer. Newer titles that use this technology and are susceptible to skipping/stuttering have a warning on the back of the case. Other titles use an advanced form of duplication that prevents this behavior. These behaviors are not specific to Apple computers. They happen on every DVD player.

Clean disc

Smudges, scratches, debris, and other anomalies on a disc's surface can interfere with an enjoyable viewing experience. You should make sure the disc is clean before playing it.

Mac OS 9 only

Network Time Server

If you have set the Date & Time control panel to use a Network Time Server, an invisible background application periodically attempts to connect to a server. This can briefly interrupt a movie's playback. To prevent this from happening, deselect Use a Network Time Server in the Date & Time control panel before watching a movie.

DHCP Servers

If the TCP/IP control panel is set to connect to the Internet using a DHCP server, but you aren't connected to the Internet, or if the DHCP server is not available, your computer may pause every five minutes or so. This pause causes the movie to stutter. To prevent this from happening, temporarily make TCP/IP inactive in the TCP/IP control panel. You may need to change the User Mode to Advanced in order to do this.

Extensions and Control Panels

A third-party extension or control panel could cause occasional delays in the system, affecting any real-time playback. Use the Extensions Manager control panel to reduce your extensions set.

Appearance Sounds

Enabling an Appearance sound track (from the Sound tab in the Appearance control panel) can cause sounds to stutter in the Apple DVD Player and other applications that play real-time audio. Make sure Appearance sound tracks are turned off. You may need to restart the computer before the sound quality improves.

Speakable Items

Having Speakable Items turned on can tax the processor enough to cause stutter in Apple DVD Player. Turn Speakable Items off in the Speech control panel while watching movies.

AirPort
If your computer uses AirPort, use the AirPort application or control strip module to turn off AirPort networking.

Sherlock Indexing
In Sherlock, open the Find menu and choose Index Volumes, and remove the mark from the Use Schedule checkbox for all of the volumes listed.

AppleTalk
AppleTalk and File Sharing can slow the computer down and cause skipping. Follow these steps to make AppleTalk inactive:

1. Open the AppleTalk control panel.
2. Choose User Mode from the Edit menu.
3. Click Advanced.
4. Click Options.
5. Click Inactive.
6. Click OK.

AppleShare IP 6.2: "The item "" cannot be written, because you do not have enough access privileges"

I sometimes receive the following error when copying a folder to an AppleShare IP 6.2 server:

"The item "" cannot be written, because you do not have enough access privileges. Do you want to continue?"

If I continue, some files and folders are not copied. What's happening?
This article has been archived and is no longer updated by Apple.
This error can occur when copying a folder to an AppleShare IP 6.2 server under the following circumstances:

- You are copying a folder that contains one or more folders from a client running Mac OS 8.5, Mac OS 8.5.1, or Mac OS 8.6 to an AppleShare IP 6.2 server.
- You have write access to the destination folder, but you are not the owner of the destination folder.
- The "Folders will inherit their privileges" option is enabled in AppleShare IP Advanced Setup.

WORKAROUNDS:

There are two main workarounds:

1) The server administrator can disable the "Folders will inherit their privileges" option in AppleShare IP Advanced Setup.
2) Individually copy each folder to the server.
Published Date: Feb 20, 2012

Macintosh Stops Responding While Printing to HP DeskJet 810C

With Mac OS 8.6, your Macintosh will freeze if you disconnect the USB cable to your HP DeskJet 810C printer or power it off while printing to it.
This article has been archived and is no longer updated by Apple.
Be careful not to inadvertently disconnect the USB cable or power off the printer until after the print job has completed printing.

A hang will occur when printing from Mac OS 8.6 with Hewlett Packard's driver, DJ800's (USB/AT) version 1.0 or 1.1.

When printing from Mac OS 9 with these printer drivers the system's behavior differs depending upon whether the USB cable is disconnected or the printer is powered off. An error message may be displayed stating your Macintosh cannot communicate with the printer, or the job may not print completely. After reconnecting or powering on the printer, reprint the job.

AppleShare IP 6.2: No Custom Installation Option

I have AppleShare IP 6.2, and I would like to install the different server components (Web & File Server, Mail Server, Print Server) on separate servers. However, there is no custom installation option available in the installer application. What should I do?
This article has been archived and is no longer updated by Apple.
The ability to install individual server components is not included in the AppleShare IP 6.2 installer on either the update CD or the stand-alone CD.

The software licensing agreement for AppleShare IP 6.2 allows the installation of only one copy of each server component, but each individual server component may reside on its own machine. To be able to run one of the server components (Mail, File, or Print) on one computer while running either one or both of the others, simply follow these steps:

1. Run the full installation of the AppleShare IP on all of the computers you wish to use as servers.

2. Open the Extensions Manager of each of the servers and deactivate the extensions you will not be using:

If removing the mail server, remove the following extensions:
- AppleShare IP Mail Config
- AppleShare IP Mail Server

If removing the print server, remove:
- AppleShare IP Print Config
- AppleShare IP Print Server

If removing the Web & File Server, remove:
- AppleShare IP Web & File
- AppleShare IP Web & File Config
- AppleShare IP Web & File Server

3. Restart the computer and open the Extensions (Disabled) folder inside the System Folder. The deactivated extensions will be there. Simply throw them away.

Final Cut Pro: Converting Audio CD Files to 48 kHz Before Importing

This article discusses a method of converting audio CD tracks before importing them for use in a Final Cut Pro DV sequence. It also provides detailed instructions on how to carry out this conversion from within QuickTime Pro's MoviePlayer application (renamed QuickTime Player application in revisions of QuickTime 4 after the b16 rev).
This article has been archived and is no longer updated by Apple.
Audio CD files are sampled at 44.1 kHz. The Final Cut Pro manual recommends that you "convert audio CD files from 44.1 kHz to 48 or 32 kHz before importing them into your [DV] sequence. If you import CD audio files directly, you will experience audible distortions in the audio." (see page 131)

Note: The manual does not describe how to carry out this conversion.

The Final Cut Pro manual recommends you convert the audio track "before" importing it into the DV sequence. There is no option to convert to 48 kHz when selecting Import File from the File menu within Final Cut Pro.

To perform this sample rate conversion prior to importing an audio CD sound track for use in a DV sequence, open an editing application, such as QuickTime Pro's MoviePlayer, import the audio CD file at 44.1 kHz, then export it, changing the kHz rate to 48 in the process of exporting the file.

Finally, after the clip's kHz rate has been converted to 48 kHz during the export process, the file can be imported into Final Cut Pro, for use in a DV sequence.

Note: This import-and-convert-while-exporting process can also be done from within Final Cut Pro, using a process similar to the one this article describes.

The details of this conversion process using QuickTime Pro's MoviePlayer follows.

1. Insert the CD from which you wish to import a sound clip

2. With the CD mounted on the desktop, open the MoviePlayer application

3. Select Import from the File menu

4. Navigate to the CD in the dialog box that opens, select the desired track, and click Convert

5. In the resulting dialog box, give the track an appropriate name (e.g., "audio1-QTimport@44.1kHz").

6. If you want only a portion of the track, click the Options button, and select a starting and ending time with the slider, or simply by inserting the appropriate time points in the Start and End fields in the Audio Selection portion of the window, then click OK.

Note: Do not attempt to convert the kHz rate: 48 kHz is not an option from this window

7. Select the appropriate destination for the file, and click Save.

Wait for the Import progress bar to finish. When it is finished importing the sound clip, it will open the file in Movie Player.

8. Select Export from the File menu

9. In the dialog box that opens click the Options button

10. In the following dialog box, click Settings in the Sound portion of the window

11. In the Sound Settings window that opens, select 48 kHz from the Rate drop down menu, confirm the bit size and Stereo or Mono selection, and click OK.

Note: 48 kHz may already be selected in the Rate field; if so, you can simply click OK

12. The new Sound Setting rate should be displayed in the Sound Settings window now; if so, click OK.

13. Back in the original Export dialog box, give the file a new name (e.g., "audio1-QTexport@48kHz"), select the appropriate destination for the file, and click Save.

Wait for the Export progress bar to finish.

14. Quit Movie Player and launch Final Cut Pro.

15. From the File menu, select Import and File from the sub-menu.

16. Navigate to the folder where the exported 48 kHz file resides, select that file name and click Open

The file will now show up in your Final Cut Pro Browser window, ready to be moved into a DV sequence.

AppleShare IP: Tips on Installing Software Successfully

How can I successfully install software applications on an AppleShare IP server?
This article has been archived and is no longer updated by Apple.
Before installing software on an AppleShare IP server, you need to quit all applications, turn off virtual memory, and turn off all extensions.

- Virtual memory can be turned off using the Memory control panel
- Extensions can be turned off using the Extensions control panel or by holding down the shift key while starting up the computer.

If your software installer does not automatically restart the computer at its completion, you will need to manually restart the server in order to turn all extensions back on. After restart, turn virtual memory on using the Memory control panel.

Mac OS: Display Resolution Switching at System Startup Time

This article explains why a Macintosh computer's display may appear to momentarily flash or flicker when the computer is turned on, or why the display has a very large image that turns into a smaller image as the computer turns on.
This article has been archived and is no longer updated by Apple.
When you turn on your Macintosh computer, the display may appear to momentarily flash or flicker, or it may display a very large image that suddenly turns into a smaller image as the computer turns on. This is normal, as long as the Macintosh uses the resolution you chose in the Monitors control panel when the Finder finishes starting up. This behavior varies from Macintosh to Macintosh depending on the model, video card, software versions, and monitor. Essentially, the computer is determining which resolution, or screen size, to use as it starts up. As it determines and sets the correct resolution, it may flash, flicker, or display images at smaller resolutions until the final resolution is displayed.

If the preferred resolution is not available on the display after the computer has started up, you may not have set up the display correctly. If your computer and display have ADB or USB connections, make sure the display is connected properly, and that the latest version of Apple Displays software is installed.

There are a number of variables that determine a display's resolution setting at system startup time:

- computer model (video driver in ROM varies)
- version of Apple Displays software (resolution stored in PRAM or preference file)
- type of video card

On earlier computers, the resolution is stored in PRAM and is read at system startup time by the video driver in ROM. Later versions of Apple Displays software rely on a preference stored on the hard drive to set this resolution instead of the PRAM setting. This preference is read during the startup sequence, and is applied either during system startup time, or when the Finder starts up, depending on the video controller.

On some computers, you can use the Monitors control panel to set the PRAM setting to the resolution of your choice. This is not the case with all Macintosh computers.

Different video cards and built-in video handle resolution preference loading at different times, depending on when the driver for the video card and built-in video is loaded. Some computers and video cards (usually older models) do not recognize multiple scan displays when the computer is turned on, because the required driver is not built into ROM, and is only loaded when the Apple Displays Software loads.

AppleVision/ColorSync models have a unique sense pin setting that, when combined with the ADB connection, tells the computer that it is an AppleVision display. Until the AppleVision extension loads, some computers and video cards will read this sense pin as a 640 by 480 display since the sense pin algorithm is not yet complete. Therefore, the computer will start up in 640 by 480. After the AppleVision extension loads, the computer will recognize the display properly, and apply the user's preference for resolution setting. Again, depending which video controller is used, the preference may load the computer is turning on, or after it has started up.

ASIP Print Server: Printing to Print Queue From Windows

How do I print from a Windows-based client to an AppleShare IP (ASIP) print queue?
This article has been archived and is no longer updated by Apple.
Starting with AppleShare IP (ASIP) 6.0, AppleShare IP Print Server supports two network printing protocols:

- PAP: This is the standard method of printing over AppleTalk-based networks
- LPR: This is an industry standard method of printing over TCP/IP-based networks

Note: AppleShare IP 5.x supports printing via PAP but not LPR.

In order to print to an ASIP print queue, a computer must be able to print via one of the two methods supported by the ASIP print server. Some versions of Windows provide the necessary client software to print over PAP and/or LPR. Others do not.

Here is a breakdown by Windows version:

Windows 95, Windows 98
Windows 95 and Windows 98 do not include any client software to print via PAP or LPR. To print from Windows 95 or Windows 98 to an ASIP print queue, you will need to acquire the necessary client software to print via PAP or LPR.

PAP: Products that provide Windows solutions for AppleTalk-based networking, including printing over AppleTalk include:

PC MACLAN by Miramar Systems, Inc.
http://www.miramarsys.com/

TSSTalk by Thursby Software Systems, Inc. (formerly COPSTalk, acquired from COPS, Inc.).
http://www.thursby.com

LPR: Any LPR client for Windows 9x should work. Products that provide LPR printing for Windows include:

ACITS LPR Remote Printing
http://www.utexas.edu/academic/otl/software/lpr/

INTELLIscribe by Brooks Internet Software, Inc.
http://www.intelliscribe.net

Windows NT 4.0
Windows NT 4.0 (Server and Workstation) includes client software to print via both PAP and LPR.

Information on how to configure Windows NT 4.0 for PAP printing is available on Microsoft's Web site at:
http://support.microsoft.com/support/kb/articles/q174/3/37.asp

Information on how to configure Windows NT 4.0 for LPR printing is available on Microsoft's Web site at:
http://support.microsoft.com/support/kb/articles/q195/6/43.asp

In addition, PC MACLAN (http://www.miramarsys.com/) and ACITS LPR Remote Printing (http://www.utexas.edu/academic/otl/software/lpr/) also provide alternative solutions for Windows NT.

Windows 3.1x
Windows 3.x does not include any client software to print via PAP or LPR. To print from Windows 3.x to an ASIP print queue, you will need to acquire the necessary client software to print via PAP or LPR. Although there used to be several products on the market, few are still available.

However, Miramar Systems, Inc. (http://www.miramarsys.com/) provides Personal MACLAN Connect as a freeware AppleTalk solution for Windows 3.x.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

AppleShare IP: Troubleshooting Shared User & Groups

This article provides troubleshooting steps for different issues users may see with the shared User & Groups database feature in AppleShare IP 6.2

This article has been archived and is no longer updated by Apple.

Distributed databases, such as Shared Users & Groups, are inherently slower and more prone to various issues than non-distributed databases. You have moved from a simple architecture of a client talking to a server to a complex architecture of a client talking to a server talking to another server. There are twice as many communication links and twice as many chances that the total connection will fail. Thus, it's even more important to have reliable networking equipment, hardware, and software configurations than it was before for the Shared Users & Groups feature to perform as expected.

That said, it's generally much easier to administer one user and group list than eleven, so the extra precautions and risks associated with shared users & groups are often worth the effort.

Here is some troubleshooting advice for common issues:

Cannot Connect to Primary Server

1. Verify that the primary server address is correct.
2. Verify that the name and password of the owner (the "main administrator," which is also defined as the Machine Owner in the File Sharing control panel) is the same on the primary as it is on the secondary. Cases must match.
3. Ensure that TCP/IP is correctly set up on both computers.
4. Make sure that you've not set up TCP Filter to block port 687.

Primary Server Slow While Downloading Users

Downloading users is a stressful operation. Think of it as being functionally equivalent to every single user trying to log in to the server at the same time. Apple does not recommend frequent use of the Download All option. It is most useful in an initial setup operation, where you have a lot of time available (in addition to being stressful, downloading users takes a long time). During a download, the interface on either computer may become unresponsive. For routine use, Apple recommends using automatic downloading, which is far less taxing on the servers, computers, and networks.

Primary Server Crashes During a Download All

Download All traverses the entire user database. As such, it copies information from the primary to the secondary that may not have been accessed for a long time, or may never have been accessed. This is usually indicative of a bad Users & Groups Data File. You should obtain the latest AppleShare IP First Aid tool and reconstruct your Users & Groups file in accordance with the instructions that come with it.

Published Date: Feb 20, 2012

AppleShare IP: Maximum Number of TCP Filters

This article discusses the number of filters you can create with TCP Filter Admin, available with AppleShare IP 6.1 and later.
This article has been archived and is no longer updated by Apple.
TCP Filter Admin is limited to creating 250 filters.

If 250 filters do not provide sufficient flexibility for your situation, be sure to use wildcards. Using wildcards allows a whole range of IP addresses to be addressed with a singe filter, and should considerably reduce the necessary filters.

If you are approaching the 250 filter limit even with the use of wildcards, consider purchasing a hardware router for the task.

From an administrative standpoint, the list of filters can become hard to manage and design before you reach the technical maximum of 250 filters. You may want to consider a hardware router if your filter list is growing unmanageably long and complex.
Published Date: Feb 20, 2012

TCP/IP Control Panel: PPP Option Missing

This article explains why PPP might not be available as an option in the TCP/IP control panel, and offers solutions.
This article has been archived and is no longer updated by Apple.
PPP is not listed as a choice in the TCP/IP control panel under the following circumstances.

PPP Software Is Missing or Disabled
Check the Extensions folder of your System Folder, you should have an extension with the words Remote Access or PPP in its name. If you do not, try reinstalling the PPP software.

- Under Mac OS 8.5 and higher, PPP is part of the bundled Remote Access installer. Open the Mac OS installer and choose Custom Install. Then, select only the Remote Access installer from the listing and click Install.
- Under Mac OS 7.6-8.1, OT/PPP is included as part of the Mac OS installer. Open the Mac OS installer and choose Custom Install. Then, select only OT/PPP from the listing and click Install.
- Under earlier revisions of Mac OS with Open Transport 1.1.1 or higher installed, you can download and install the OT/PPP package from Apple Software Updates. Or, if you have purchased Remote Access 3.x separately, you can run the Remote Access Client installer to install PPP functionality.

For more information about downloading OT/PPP, search the Apple Software Updates Web site at http://www.apple.com/swupdates.

If your computer came with a Software Restore CD, and you are using the original system software that came with your Macintosh, Apple recommends that you use the software restore function of the Software Restore CD, instead of a custom installation of system components.

There are also third-party implementations of PPP available, such as MacPPP and FreePPP. If you are using one of these implementations, check the documentation included with them, and try re-installing the software to see whether it remedies the issue.

For more information about PPP solutions, refer to article 21073: "**MacPPP 2.5: Read Me for Open Transport 1.1**"

If you are using the Apple Internet Connection Kit, you should upgrade your PPP software to OT/PPP, Remote Access 3.x, or the latest version of a third-party implementation.

The Modem Software Is Not Installed Correctly
If you have an iMac, Power Macintosh G3 (Blue and White), or PowerBook G3 (Bronze keyboard), and you have an internal modem, you must have the correct modem extension installed in order for the computer to recognize the modem. You can usually tell whether this is the case by checking the Modem control panel. If the choice for internal modem is not available, it is likely that the modem extension is either not installed or inactive. You can re-install the modem software by custom installing it from the OS installer.

If you have a PowerBook and are using a PCMCIA modem, you may need to install additional software in order for the modem to be recognized. Some third party PCMCIA cards come with software, which is required for the modem to be recognized properly. Consult the documentation that came with your PCMCIA modem for installation instructions.

If you have a Macintosh using a GeoPort Telecom adapter, you must also install the Geoport/Express Modem software in order for the computer to recognize and use the modem, but this should not keep PPP from being listed as an available choice in the TCP/IP control panel.

If your computer came with a Software Restore CD, and you are using the original system software that came with your Macintosh, Apple recommends that you use the software restore function of the Software Restore CD, instead of a custom installation of system components.

There Is a System Software Issue
An extension or control panel may be preventing the PPP option from being listed in the TCP/IP control panel. You can troubleshoot this issue by using the Extensions Manager. Build a custom set by duplicating the Mac OS extensions set and adding only the extensions needed for your modem software and PPP.

For more information about extension conflicts, refer to:
article 15926: "**System 7.5: Accessing Extensions Manager To Troubleshoot Extension Conflicts**"
article 30929: "**Mac OS 8.x: Extensions Troubleshooting/Extensions Manager Features**"

A "PPP not installed" message can be caused by some versions of AOL Link. For more information about this issue refer to
TIL Online Archive Article 30064: "**Internet Dialer: PPP not installed Message**"

If the choice is still not available for internal modem, or if the PPP choice is still not available, try performing a clean installation of the system software, modem software, and PPP software in combination. Be sure to export or write down your TCP/IP and PPP settings before performing

a clean installation.

For more information about performing a clean installation, refer to:
article 50055: "**Miscellaneous Manuals**". Select Troubleshooting Handbook - How to Perform a Clean Installation.
article 30691: "**Mac OS: When & Why to Perform a Clean Install**"

The Modem Is Not Properly Installed or Active
For PCMCIA modems used with PowerBooks that have PCMCIA slots, the modem should appear on the desktop when installed properly. If you are having difficulties with your PCMCIA modem, try ejecting and reseating the modem, or try inserting the modem in another slot if available.

With internal modems, you may also have an issue where the modem is unseated, causing the Internal Modem choice to be unavailable in the Modem control panel. First, check the Modem control panel to see whether Internal Modem is an available choice. If not, then try the previous troubleshooting steps to check for software issues. If you have already tried re-installing the modem software, try resetting the PRAM.

Keep in mind, after resetting PRAM, you may need to change your AppleTalk preferences in the AppleTalk control panel or Chooser if you have a modem or serial printer connected to your printer port. Resetting the PRAM makes AppleTalk active on the printer port.

For more information about resetting the PRAM refer to article 2238: "**Macintosh: How to Reset PRAM and NVRAM**"

If the modem is still not recognized or operating properly and it is installed internally, the modem may need to be reseated. Consult the documentation that came with your Macintosh for instructions on modem installation or take your computer to an Apple-authorized service provider for assistance.

For additional information concerning general modem troubleshooting refer to article 43079: "**iMac Modem: Troubleshooting References**"
Published Date: Feb 20, 2012

Mac OS X Server: "System Panic" Message

I have Mac OS X Server installed on my machine and have received a message on the screen reporting a "System Panic." The server is not responding. What has happened?
This article has been archived and is no longer updated by Apple.
A System Panic, sometimes called a kernel panic, happens when the kernel cannot continue handling requests.

Below are several possible causes:

- In all likelihood, this is a very rare software crash that can happen despite the extremely strong nature of Unix-style operating systems like OS X Server. Heed the warning, restart into single-user mode, and run a file system check.

  For additional information on running a file system check see:
  Article 24501: "**Mac OS X Server: Why, When, and How to Run fsck for File System Maintenance**"

- If this warning message appears again, it is possible there is a hardware compatibility issue. Even if the original hardware is a supported factory configuration for Mac OS X Server, there could be a hardware component that has been added to the factory configuration and causing issues. Try removing any third party hardware that has been added.

- After confirming there is no hardware compatibility concerns, the server is still frequently reporting System Panics, there could be an issue with the operating system. Reinstalling Mac OS X Server from your installer CD should fix this issue.

  Caution: Remember that the Mac OS X Server installation erases the contents of the partition it is installed onto.

- If the system is a Mac OS X Server supported factory configuration, and the server frequently reports a System Panic even after a reinstall of the Mac OS X Server software, there could be a failure of a hardware component that shipped with the computer. The Macintosh should be taken to an Apple-authorized service provider.

  To locate the nearest Apple-authorized service provider visit the following Apple Web site:
